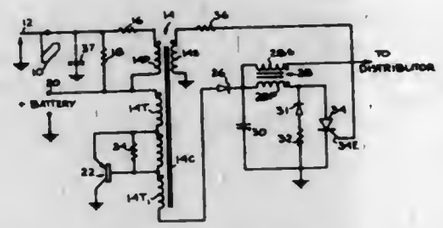
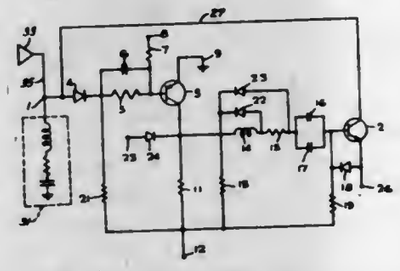
1. A symmetrical current controlling device for an electrical circuit including a mechanism type semiconductor material means and electrodes in non-rectifying contact therewith for connecting the same in series in said electrical circuit, said semiconductor material means being of one conductivity type, said semiconductor material means including means for providing a first condition of relatively high resistance for substantially blocking current therethrough between the electrodes substantially equally in each direction, said semiconductor material means including means responsive to a voltage of at least a threshold value in either direction or alternately in both directions applied to said electrodes for altering said first condition of relatively high resistance of said semiconductor material means for substantially instantaneously providing at least one path through said semi-conductor material means between the electrodes having a second condition of relatively low resistance for conducting current therethrough between the electrodes substantially equally in each direction, said semiconductor material means including means for maintaining said at least one path of said semiconductor material means in its said second relatively low resistance conducting condition and providing



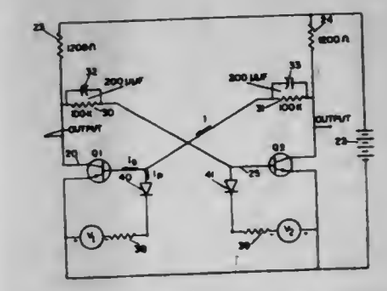
a substantially constant ratio of voltage change to current change for conducting current at a substantially constant voltage therethrough between the electrodes which voltage is the same for increase and decrease in current above a minimum current holding value, and providing a voltage drop across said at least one path in its said second relatively low resistance conducting condition which is a minor fraction of the voltage drop across said semiconductor material means in its said first relatively high resistance blocking condition near said threshold voltage value, and said semiconductor material means including means responsive to a decrease in current, through said at least one path in its said second relatively low resistance conducting condition, to a value below said minimum current holding value for immediately causing realtering of said second relatively low resistance conducting condition of said at least one path to said first relatively high resistance blocking condition.

3,271,592
CRYOGENIC ELECTRONIC MEMORY UNIT
John W. Bremer, Sunnyvale, Calif., and Vernon L. Newhouse, Scotia, N.Y., assignors to General Electric Company, a corporation of New York
Original application Aug. 4, 1960, Ser. No. 47,539. Divided and this application Aug. 19, 1963, Ser. No. 311,272
2 Claims. (Cl. 307—88.5)



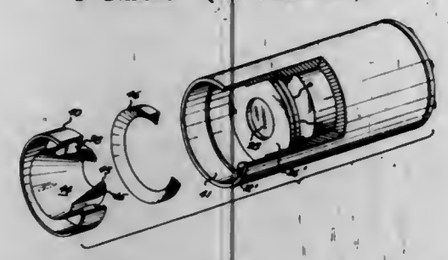
1. A memory device comprising a loop circuit capable of superconduction, a second circuit coupled to said loop circuit for producing a persistent current in said loop circuit in one direction for one type of information and in the opposite direction for a second type of information, a conductor which is normally superconducting crossing said loop circuit, and means for providing a second current through said second circuit which increases the magnitude of the persistent current when the persistent current is in one direction and decreases the magnitude of the persistent current when the persistent current is in the opposite direction to render said conductor non-superconducting for said one direction of said persistent current so that the magnitude of the resistance of said conductor indicates the type of information stored in said loop circuit.

3,271,593
INTERNAL COMBUSTION ENGINE IGNITION SYSTEM
Alan J. De Vilbiss, 2134 N. Marengo, Altadena, Calif.
Filed Dec. 5, 1963, Ser. No. 328,404
4 Claims. (Cl. 307—88.5)



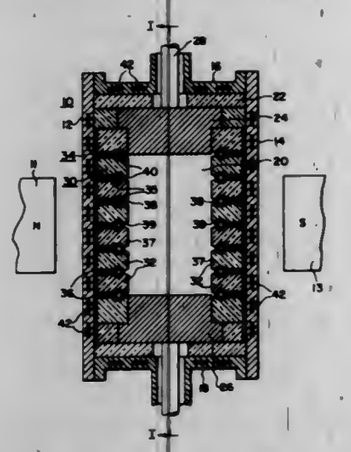
1. In an internal combustion engine of the type wherein breaker points are employed for making and breaking a connection to a battery whereby current is made to flow through the primary winding of a step-up transformer and then interrupted, and the secondary winding of the step-up transformer is connected through a distributor to spark plugs, the improvement comprising a transformer having a common core on which there are wound a primary winding, a secondary winding, a tertiary winding including a first winding portion, a second winding portion, and a step-up winding portion, means connecting said primary winding to said battery through said breaker points, a controlled rectifier having a control electrode, a capacitor, means connecting said control electrode to said secondary winding, means connecting said capacitor and controlled rectifier in series and across said step-up transformer primary winding, means connecting said tertiary winding in series with said primary winding of said step-up transformer, means establishing a blocking oscillator including a transistor having a base emitter, and collector electrodes, means connecting said transistor base and emitter respectively to the opposite ends of said second winding, and means connecting said battery across said tertiary winding, said primary winding of said step-up transformer and said controlled rectifier.

3,271,594
TRANSIENT AUGMENTATION CIRCUIT FOR PULSE AMPLIFIERS
James E. Webb, Administrator of the National Aeronautics and Space Administration with respect to an invention of Richard D. Benedict
Filed June 16, 1964, Ser. No. 375,680
7 Claims. (Cl. 307—88.5)



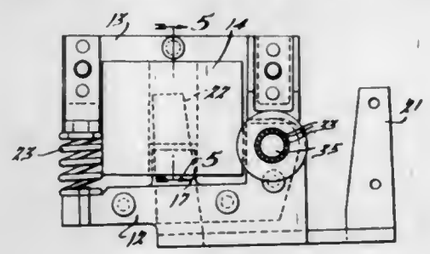
1. A transient augmentation circuit for a pulse amplifier having an equivalent overdamped series resistance-inductance-capacitance load comprising:
a first inverter amplifier having an input and output;
a second inverter amplifier having an input and output;
a resistance-inductance-capacitance network connected between the output of said first inverter amplifier and input of said second amplifier, the current amplitude versus time characteristic of said network, in response to a step change input, being proportional to the negative short circuit current versus time characteristic of an overdamped series resistance-inductance-capacitance load; and
input-output terminal means joining the input of said first inverter amplifier and output of said second inverter amplifier to provide regeneration in said transient augmentation circuit.

3,271,595
SWITCHING CIRCUIT
Gilles J. Overtveld, Ottawa, Ontario, Canada, assignor to Northern Electric Company Limited, Montreal, Quebec, Canada
Filed May 14, 1963, Ser. No. 280,403
5 Claims. (Cl. 307—88.5)



1. In a switching circuit which comprises a pair of current valves each valve comprising a current emitter, a current control electrode, and a current collector, said control electrode controlling current flow between said emitter and said collector in dependence upon electrical bias between said emitter and said control electrode, means connecting each said valve for urging current flow between its respective emitter and collector, means interconnecting said valves for alternate switching between a pair of circuit states, the first state comprising current conduction through the first of said valves and current interruption through the second of said valves and the second state comprising current conduction through said second valve and current interruption through said first valve, said circuit being triggerable for switching from the second to the first state by application of current between said control electrode and said emitter of said second valve; said interconnecting means comprising, means connecting the collector of the first valve and the control electrode of the second valve, the collector of said first valve and said interconnected control electrode of said second valve being low in potential with respect to the emitter of said second valve when said circuit is in said first state and being higher when said circuit is in said second state, the improvement which comprises: a non-linear resistive conducting device presenting a higher impedance when carrying a small direct current in one direction and a lower impedance when carrying a larger direct current in said direction, and means connecting said non-linear resistive device in series with a triggering signal source between said control electrode and said emitter of said second valve for passing said small current through said device when said circuit is in said second state in the absence of a triggering signal from said triggering signal source and for passing said larger current when said circuit is in said second state in the presence of a triggering signal, said non-linear resistance device heightening sensitivity of the circuit to triggering by said triggering signal source from its second to its first state.

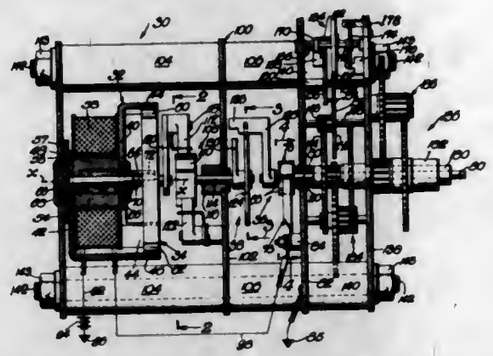
3,271,596
ELECTROMECHANICAL TRANSDUCERS
Jesse R. Brinkerhoff, Seattle, Wash., assignor to The Boeing Company, Seattle, Wash., a corporation of Delaware
Filed Nov. 12, 1963, Ser. No. 322,941
5 Claims. (Cl. 310—8.7)



1. In an electromechanical transducer, the combination of a flexural mode transducer element which is mounted in an open-ended housing to transmit or receive a pressure wave in the direction of vibration thereof, the relatively central and peripheral portions thereof tending to vibrate out of phase with one another about a nodal contour of substantially no motion in the direction of vibration, and means on the housing which operate to define a plurality of pathways for the pressure wave between the end opening of the housing and the adjacent face of the element, one of which pathways extends between the end opening and the center portion of the face to carry pressure peaks in the center of the wave, and the other of which extends between the opening and the peripheral portion of the face to carry pressure peaks in the periphery of the wave, said other pathway being approximately 0.5 of a wavelength longer than the one pathway so that corresponding pressure peaks in the center and periphery of the wave are brought into phase with one another in traveling between the end opening of the housing and the face of the element.

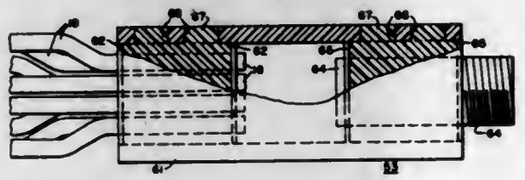
3,271,597
MAGNETOHYDRODYNAMIC GENERATING DUCT
Stewart Way, Churchill Boro, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed Aug. 22, 1963, Ser. No. 303,965
6 Claims. (Cl. 310—11)

1. An elongated generating duct for a magnetohydrodynamic generating system, said duct comprising spaced elongated electrode bearing walls and at least one elongated wall disposed between said electrode bearing walls along the length thereof, said walls cooperatively enclosing at least one elongated channel for flow of conductive fluid therethrough, elongated current barrier means supported on said one wall and including a plurality of elongated members spaced from each other and disposed in a reference plane including the interelectrode direction and the duct longitudinal direction, said elongated members extending in one of said directions and projecting laterally inwardly of said one wall into the space between said electrode bearing walls, and thermally insulative means disposed adjacent said one wall for forming a major inner refractory surface adjacent the elongated channel and conductive fluid and divided into a plurality of electrically separate layers respectively separated by said elongated current barrier members so that current therethrough is substantially impeded at elevated operating temperatures.



3,271,598
PIVOT MOUNTING FOR OSCILLATORY TOOL
Edward G. Sturgeon, Orchard Lake, Mich., assignor to Syncro Corporation, Oxford, Mich., a corporation of Michigan
Filed Nov. 14, 1963, Ser. No. 323,678
7 Claims. (Cl. 310—29)

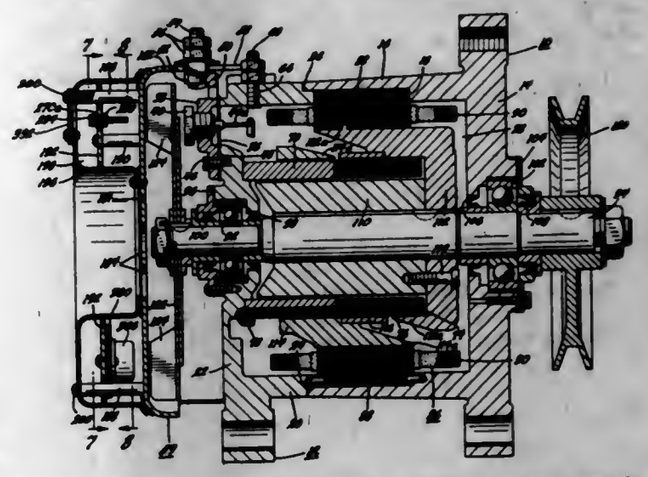
5. In a pivot mounting for the armature of an electromagnetic reciprocating motor having an elongated armature, E-shaped core, and coil mounted on the central portion of said core, a pair of legs on one end of said core, said legs being spaced from and on opposite sides of one end of said armature, said legs and the armature portion between the legs having apertured portions, the apertured portion in said armature being of slightly smaller diameter than the apertured portions in said legs, spring means between said armature and core urging the armature away from the core, a plurality of spring-like rods of circular cross-sectional shape extending through said apertured portions and between said armature and legs, said rods being annularly arranged and in closely adjacent relation within the apertured portion of said armature, and plugs within said apertured portions forcing the portions of said rods within said apertured portions against the walls of the apertured portions so as to be in frictional contact therewith, the free lengths of said rods between said apertured portions having some slack and being slightly S-shaped in their unstretched condition when the armature is at rest, at least some of the slack of said free rod lengths being taken up when said armature approaches each end of its arcuate stroke.



3,271,599
OSCILLATING D.C. MOTOR OF REGULATED OUTPUT TORQUE
Walter Kohlhagen, 818 Oakley Ave., Elgin, Ill.
Filed Apr. 14, 1964, Ser. No. 359,629
11 Claims. (Cl. 310—36)

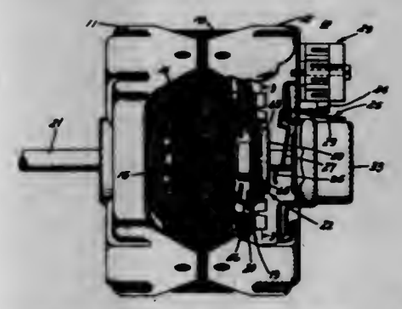
1. In a motor, the combination with coil means, a rotary element, means operative on successive energizations of said coil means to step said element in one direction into successive positions equally spaced from each other at an angle of less than 360°, a rotary device, preloaded spring means interposed between and drivingly connecting said element and device, and means providing for free operational relative rotation between said element and device through a range within which said spring means remains preloaded and to one end of which said device is urged by said spring means, with said range being in excess of, but less than twice, said angle, of means locking said element in said positions only against rotation opposite to said one direction; and circuit means for said coil means, including brush and commutator units of which one unit is said device, with said units arranged to close said circuit means when in any of said

positions of said element said one unit is in position at either end of an endlength of said range which extends from said one end thereof over a distance substantially equal to said range excess, and to open said circuit means at the end of the drive of said one unit from either of said positions thereof through a distance smaller than said angle.



3,271,600
DYNAMOELECTRIC MACHINE
Harold M. Philofsky, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed June 22, 1964, Ser. No. 376,914
5 Claims. (Cl. 310—55)

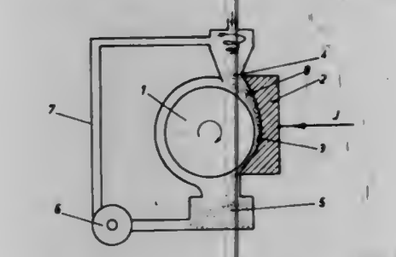
1. In a dynamoelectric machine having an annular stator core with a plurality of longitudinal slots therein, a plurality of stator winding members disposed in said slots, each of said winding members including winding conductors and a plurality of duct members disposed in good thermal relation with the winding conductors and insulated from the winding conductors and each other within the slot, coolant supply means for circulating a coolant fluid through said duct members, insulating connector means at each end of each winding member for connecting the duct members to the coolant supply means, said connector means including a mass of insulating material in which the ends of the duct members are embedded to hold the duct members in separated relation and to insulate the duct members from each other, and means independent of the connector means for effecting electrical connection between the winding conductors of different winding members.



3,271,601
DYNAMOELECTRIC MACHINE
Louis J. Raver, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 28, 1961, Ser. No. 141,448
5 Claims. (Cl. 310—68)

1. In combination, an alternating current generator having an output winding, a rotor and an end frame, diode means supported by said end frame for rectifying the A.C. output of said output winding to direct current, fan means connected with the rotor of said generator, a fan shroud supported by the end frame of said generator enclosing said fan means and positioned to direct air over said diode means, a cover member secured to said fan shroud

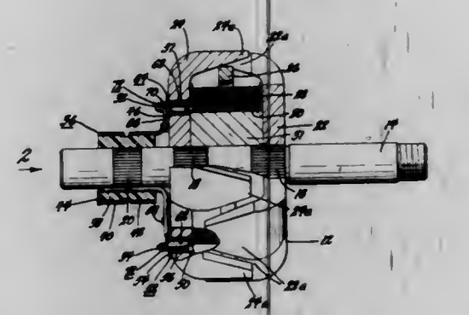
forming a sealed chamber, an annular printed circuit board disposed within said chamber, electrical circuit components supported by said printed circuit board and forming a regulating means, and means connecting said regulating means with said generator.



3,271,602
CENTRIFUGAL SWITCHING MECHANISMS FOR DYNAMOELECTRIC MACHINES
James L. Waters, Malta, Ill., assignor to General Electric Company, a corporation of New York
Filed Sept. 5, 1963, Ser. No. 306,815
12 Claims. (Cl. 310—68)

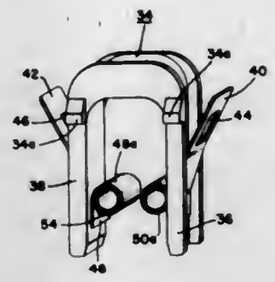
1. A centrifugal switching mechanism for use in a motor having a rotatable assembly including a rotor carried on a shaft, an end shield member rotatably supporting one end of said shaft and a switching means mounted externally on the end shield member and including a movable switch element for actuating said switching means, said centrifugal switching mechanism comprising: a switch actuator pivotally supported on said end shield member and formed with a radial and an axial portion, said radial portion being disposed internally of the end shield member, said axial portion extending through an opening in the end shield member and being disposed in engaging relation to the movable switch element of the switching means, and said radial portion when urged in an axial direction causing a pivotal movement of said switch actuator and effecting a displacement of the switch element to actuate the switching means; and a centrifugal weight assembly mounted on the rotatable assembly for rotation therewith and including a pair of relatively movable centrifugal weight members, a push collar disposed concentrically about the shaft and axially movable with respect to the shaft, said push collar being carried by said centrifugal weight members, and a biasing means joined with said centrifugal

weight members to urge said push collar against said radial portion of the switch actuator and hold the radial portion in an outward position during the starting condition, and said push collar being disengaged from said radial portion of the switch actuator by the retracting action of said centrifugal weight members when the motor reaches a predetermined speed thereby to permit said axial portion of the switch actuator to be moved with the push element of said switching means in non-actuating relation therewith.



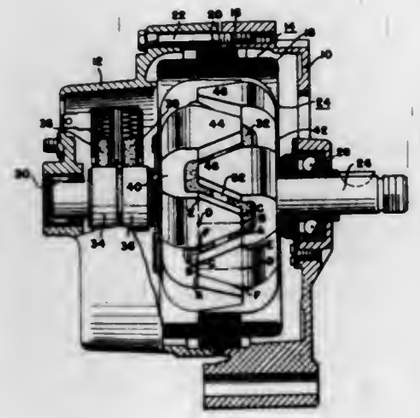
3,271,603
DEVICE FOR TRANSMITTING ELECTRICAL CURRENTS
Eugen Wiedemann, Baden, Switzerland, assignor to Aktiengesellschaft Brown, Boveri & Cie., Baden, Switzerland, a joint-stock company
Filed Dec. 30, 1963, Ser. No. 334,444
Claims priority, application Switzerland, Jan. 7, 1963, 134/63
8 Claims. (Cl. 310—219)

1. A device for transmitting electrical currents from stationary to rotating parts, characterized in that an electrically conductive solid matter finely divided into a pourable state serves as the transmission medium and that between the contact points of said parts a channel for guiding the conductive matter is provided.



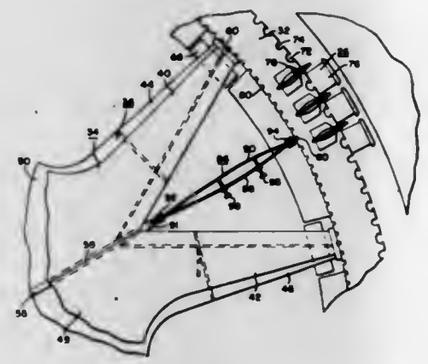
2. A device as in claim 1, characterized in that the channel between the stationary and rotating part is arranged in such a manner, that the solid matter at the contact point is compressed by the centrifugal effect.

3,271,604
ELECTRICAL CONDUCTOR CONNECTING DEVICE
Jack N. Priddy, Middletown, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Nov. 21, 1962, Ser. No. 239,184
11 Claims. (Cl. 310—234)



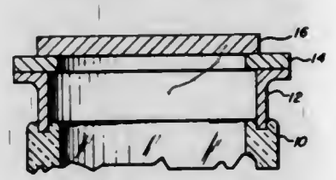
1. An electrical connection for connecting two electrical devices located on opposite sides of a member, an opening in said member, an insulator member having a bore fitted in said opening, a terminal member having a ferrule portion press fitted in the bore of said insulator for urging said insulator into tight engagement with the wall of the opening in said member, first and second conductor means connected with said electrical devices at least one of which passes through the ferrule portion of said terminal, and integral lug means on said terminal member crimped into engagement with said first and second conductor means to hold them in place.

3,271,605
BRUSH HOLDER ASSEMBLY
Walter Drabik, Downers Grove, Ill., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 9, 1963, Ser. No. 328,945
13 Claims. (Cl. 310—239)



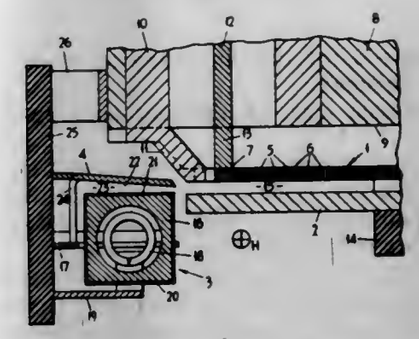
9. A brush holder arrangement for a dynamoelectric machine comprising, a brush holder formed of die cast electrically conductive material, said brush holder having a plurality of brush holding chambers, a pair of brushes disposed in each of said chambers, said brushes engaging each other within each chamber, a brush spring support assembly for each pair of brushes, said assembly including a U-shaped member formed of insulating material, a pair of constant force springs carried by each support assembly and engageable with one end of said brushes for urging said brushes toward a rotating conductor and a pair of spring arms for each of said supports, each of said spring arms having slots which receive integral projecting portions of said brush holder, and conductor means connecting all of said brushes with said brush holder.

3,271,606
ROTOR ASSEMBLY
George C. Collins, Pendleton, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Nov. 5, 1962, Ser. No. 235,278
5 Claims. (Cl. 310—263)



1. A rotor assembly for a dynamoelectric machine or the like comprising, a shaft, a field coil assembly carried by said shaft, first and second rotor segments carried by said shaft having interfitting pole teeth, each of said pole teeth having an outer surface defined by first and second sections, each outer surface being generally V-shaped, said first section being defined by a part of a cylinder having a constant radius and located at the leading edge of said teeth, said second section being defined by a shape having a circumferentially extending non-circular arc which curves in at an increasing rate toward the longitudinal axis of a respective rotor segment and located at the trailing edge of said teeth.

3,271,607
WATERWHEEL DYNAMOELECTRIC MACHINE ROTOR
Barney Slotnick, Irwin, and Albert W. Latham, Murrysville, Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Aug. 15, 1963, Ser. No. 302,416
15 Claims. (Cl. 310—269)

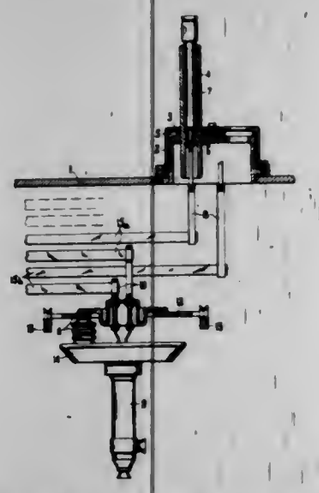


14. A rotor member for a dynamoelectric machine, said rotor member comprising an annular rim member and a spider member, the spider member having a plurality of generally radial arms and the rim member being disposed circumferentially about the ends of the spider arms, and means for securing the rim member to the spider member including a plurality of rigid clamping means extending radially between a portion of the spider member and the rim member, each of said clamping means engaging the spider member and the rim member and being radially extensible to apply a radial clamping force between the spider member and the rim member.

3,271,608
X-RAY VIDICON TARGET ASSEMBLY
Martin Rome and Harold O. W. Jordan, Stamford, Conn., assignors to The Machlett Laboratories, Incorporated, Springdale, Conn., a corporation of Connecticut
Filed Apr. 30, 1962, Ser. No. 191,099
7 Claims. (Cl. 313—65)

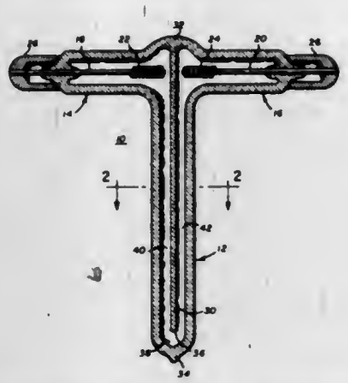
1. An X-ray sensitive electron discharge device comprising an evacuated dielectric envelope, a source of electrons in one end of the envelope, and a faceplate assembly sealing the opposite end of the envelope, said faceplate assembly comprising a beryllium disc on the outer surface thereof, said disc being transparent to X-radiation and opaque to visible light, a layer of X-ray sensitive photoconductive material on the inner surface thereof, said material being noncompatible with beryllium and being exposed to electrons from said source, and means between said beryllium disc and photoconductive material for preventing reaction between the photoconductive material and the beryllium disc.

3,271,609
ELECTRON GUNS
Alan Reddish, Pinner, and Donald William Ward, Watford, England, assignors to The M-O Valve Company Limited, London, England
Filed Jan. 3, 1963, Ser. No. 249,259
Claims priority, application Great Britain, Jan. 16, 1962, 1,632/62
2 Claims. (Cl. 313—82)



1. A crossed field electron gun including a thermionic cathode having an electron emissive surface and a plate having an operating surface which faces said emissive surface so that the cathode and plate define between them a gun space which is laterally bounded by said surfaces, the gun being arranged to operate with the plate held positive with respect to the cathode so as to establish an electrostatic field within the gun space and with a magnetic field established within the gun space perpendicular to the electrostatic field and to the length of the gun space, the geometry of the electrodes being such that the gun space is of uniform cross-section in planes perpendicular to such magnetic field, whereby in operation electrons emitted from said emissive surface are formed into a beam which travels along the gun space and then emerges from one end of the gun space, and said uniform cross-section being such that the parameters L, D, X, Y, F and S defined below satisfy the following conditions: L is greater than D; for values of X between zero and 0.7 inclusive the value of Y lies between one and $(1+1.5X)$ inclusive; for values of X between 0.7 and one inclusive the value of Y is not less than $(2.5X-0.75)$, the value of Y being finite for values of X up to at least 0.9; for any value of X for which the value of the differential coefficient dY/dX is finite there is no greater value of X for which the value of dY/dX is lower; F is considerably less than D; and S never decreases with increasing values of X, where, in said cross-section: L is the length of the projection of the trace C of said emissive surface on an axis A constituted by that straight line which is tangential to the trace C at that end point E of the trace C which corresponds to the end of the gun space from which the electron beam emerges in operation; D is the distance between the trace C and the trace P of said operating surface along a straight line which is perpendicular to the axis A and which passes through the point E; for any point O on said projection of the trace C, X is the distance between the points O and E divided by the length L, and Y is the distance between the traces C and P along a straight line which is perpendicular to the axis A and which passes through the point O divided by the distance D; F is the distance by which the trace P extends beyond the point E in a direction parallel to the axis A; and S is the spacing between the trace C and the trace P at any point B on the trace C measured along the normal to the trace C at that point B.

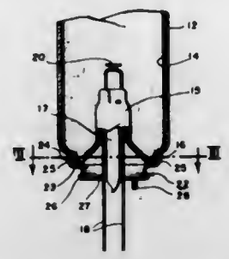
3,271,610
COLOR CATHODE RAY TUBE WITH INDEX STRIPES ON ULTRA-VIOLET-EMITTING PHOSPHOR LAYER
Harold B. Law, Princeton, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed Aug. 26, 1963, Ser. No. 304,311
8 Claims. (Cl. 313—92)



6. A cathode ray tube including an electron-sensitive creen comprising:
(a) a mosaic layer of different color-emitting phosphors,
(b) a layer of phosphor adjacent to said mosaic layer,
(c) a reflective layer between said mosaic layer and said phosphor layer which is reflective of the luminescence of said phosphor layer, and
(d) an array of spaced-apart strips of material which will absorb luminescence from said phosphor layer, said strips being disposed between said reflective layer and said phosphor layer.

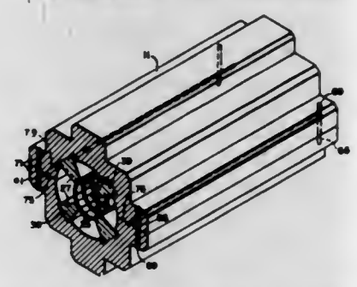
3,271,611
ELECTRICAL CONNECTING DEVICE AND ELECTRON GUN EQUIPPED THEREWITH
Paul Thome, Saint-Cloud, Albert Recule, Igny, and René Roudier, Sucy-en-Brie, France, assignors to Commissariat a l'Energie Atomique, Paris, France
Filed July 15, 1963, Ser. No. 294,976
Claims priority, application France, July 18, 1962, 904,413
4 Claims. (Cl. 313—149)

1. A device for effecting an electrical connection between a terminal movable transversely and longitudinally in a first plane and a fixed terminal disposed adjacent to said first plane, comprising: a generally U-shaped resilient metal strip having a cross-section approximately of circular arc configuration with an angular amplitude of 10° to 90° when said strip is relaxed and no bending stress is applied thereto, said strip including a pair of rectilinear sections extending generally longitudinally of said first plane and connected by a bent, generally semicircular elbow section defining a circular arc of an amplitude ranging from 120° to 210°, all of said sections lying generally in a second plane extending generally parallel to said first plane, the outer ends of said rectilinear sections being secured respectively to said movable terminal and said fixed terminal, and the amplitude of said resilient strip cross-section being substantially zero at a region within said elbow section so that said strip is substantially flat in said region, said region of said strip remaining substantially flat while said rectilinear sections of said strip are moved toward and away from each other during transverse movement of said movable terminal and while the lengths of said rectilinear sections remain generally constant, and said substantially flat region of said strip in said elbow section moving along the length of said resilient strip as the lengths of said rectilinear sections are varied with respect to each other during longitudinal movement of said movable terminal while the portions of said resilient strip on opposite sides of said region retain their curved cross-sections, whereby the portion of said resilient strip extending between the secured outer ends thereof is self-supporting.



3,271,612
FLASH DEVICE
Charles H. Keller, Sunnyvale, Calif., assignor to PEK Labs, Inc., Sunnyvale, Calif., a corporation of California
Filed Mar. 19, 1963, Ser. No. 266,316
3 Claims. (Cl. 313—220)

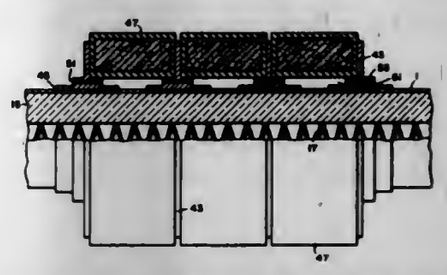
1. An arc discharge flash lamp comprising: a sealed T-shaped envelope defining a T-bar portion and a T-leg portion containing a gaseous substance at less than atmospheric pressure, a partition extending centrally along said T-leg portion with the upper end thereof extending into and being sealed transversely across said T-bar portion to form two communicating chambers and the lower end of said partition forming a communication gap with the lower end of said T-leg portion for communicating the partitioned sections of said envelope; a single field emission anode mounted in one end of said T-bar portion and extending into said T-bar portion with its arc end portion facing one side of said partition; and a single field emission cathode mounted in the other end of said T-bar portion and extending into said T-bar portion with its arc end portion facing on the other side of said partition.



3,271,613
STRESS-RELIEVED SEAL STRUCTURE FOR ARCUATE FLUORESCENT LAMP OR THE LIKE
Daniel M. Spell, Jr., Dunnedin, Fla., and Jack D. Rowe, Fairmont, W. Va., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Dec. 6, 1962, Ser. No. 242,673
5 Claims. (Cl. 313—318)

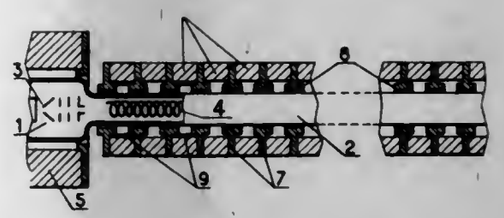
1. In an electric lamp or the like, a seal structure comprising;
a vitreous envelope having a closed end portion, and a cap having a metal rim portion that has a different coefficient of expansion than the vitreous material from which the envelope is made and is joined directly to and forms a seal with the closed end portion of said envelope,

said rim portion having an opening therein that extends from its periphery inwardly toward the body of said cap and thereby permits the rim segments of said cap to flex with the joined envelope portions under varying temperature conditions.



3,271,614
ELECTRON DISCHARGE DEVICE ENVELOPE STRUCTURE PROVIDING A RADIAL FORCE UPON SUPPORT RODS
John M. Scott, Linthicum Heights, Md., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed Aug. 18, 1961, Ser. No. 132,371
6 Claims. (Cl. 315—3.5)

1. An electron discharge device comprising an envelope, means disposed at one end of said envelope for the production of an electron beam along the length of said envelope, electron collecting means disposed at the opposite end of said envelope, slow wave propagating means disposed within said envelope for the propagation of electromagnetic energy along the length of said envelope, and means inserted between and abutting said envelope and said slow wave propagating means for conducting heat from said slow wave propagating means, said envelope comprising first and second channel members mechanically joined together to exert a radial force upon said means for conducting heat from said slow wave propagating means, and to ensure an efficient heat transfer between said slow wave propagating means and said envelope.

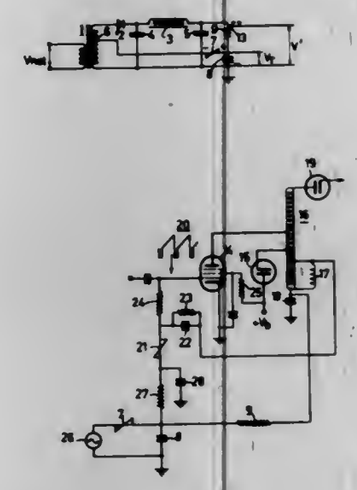


3,271,615
TRAVELING WAVE ELECTRON DISCHARGE DEVICE HAVING MEANS EXERTING A RADIAL FORCE UPON THE ENVELOPE
Frederick L. Washburn, Jr., Round Bay, Md., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed Aug. 23, 1961, Ser. No. 133,346
6 Claims. (Cl. 315—3.5)

1. A traveling wave electron discharge device comprising an envelope made of a deformable, metallic material, means for generating and projecting an electron beam, means disposed for collecting said electron beam, wave propagating means disposed in an interacting relationship with said electron beam, a plurality of electrically insulating, heat conducting support members disposed between and abutting said envelope and said wave propagating means to position said wave propagating means in a spaced relationship with respect to said envelope, and annularly shaped members disposed about said envelope

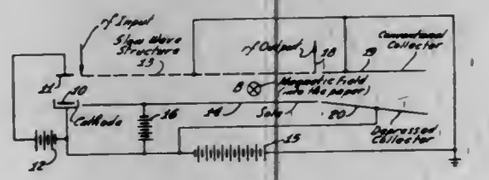
and having an inside diameter of such size so as to exert a radial compressive force on the outside wall of said envelope whereby good thermal contact is achieved between said wave propagating means, support member, and envelope.

3,271,616
FOCUSING SYSTEMS WITH ALTERNATING MAGNETS FOR TRAVELING WAVE TUBES
Bernard Verger, Paris, France, assignor to CSF-Compagnie Generale de Telegraphie Sans Fil, Paris, France
Filed Mar. 20, 1962, Ser. No. 181,035
Claims priority, application France, Apr. 4, 1961, 857,631
7 Claims. (Cl. 315—3.5)



1. An O-type traveling wave tube, comprising:
an elongated, substantially cylindrical envelope,
electron gun means located within a first portion of said envelope;
a wave retarding structure located within a second portion of said envelope substantially adjacent said first portion;
and a focussing system for said tube including a substantially permanent magnet within the area of and surrounding said first portion, a series of substantially identical annular permanent magnets, of alternately opposite polarities, within the area of and surrounding said second portion, pole pieces arranged between adjacent permanent magnets, and a flux-carrying element, disposed on the first and third permanent magnet of said series near said electron gun means interconnecting the pole pieces thereof.

3,271,617
CIRCUIT ARRANGEMENT FOR PRODUCING A DIRECT VOLTAGE BY MEANS OF A RESISTANCE ELEMENT HAVING A NON-LINEAR SYMMETRICAL CURRENT-VOLTAGE CHARACTERISTIC
Antonius Boekhorst, Eindhoven, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Feb. 26, 1962, Ser. No. 176,492
Claims priority, application Netherlands, Apr. 13, 1961, 263,600/61
12 Claims. (Cl. 315—27)



12. A circuit for producing a direct voltage which varies inversely in amplitude with the amplitude of an alternating voltage comprising a resistance element hav-

ing non-linear symmetrical current-voltage characteristics, a capacitor, a source of a symmetrical alternating voltage adapted to supply a given amplitude range of voltages, means serially connecting said resistance element and capacitor to said source of alternating voltage, means providing a direct voltage to said resistance ele-

ment of a magnitude to bias said resistance element to operate over the non-linear region of said characteristic curve for said given amplitude range of voltages whereby a direct voltage is produced across said capacitor which varies inversely in amplitude with the amplitude of said alternating voltage, and output circuit means connected across said capacitor.

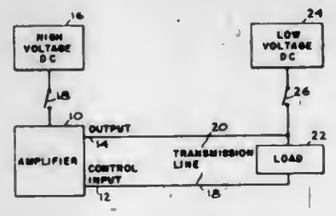
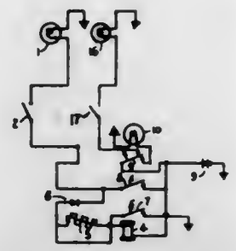
DEPRESSED COLLECTORS FOR CROSSED FIELD TRAVELLING WAVE TUBES
Gerald P. Kooyers, Santa Clara, Calif., assignor to Litton Precision Products, Inc., a corporation of Delaware
Continuation of application Ser. No. 241,396, Nov. 30, 1962. This application Oct. 28, 1963, Ser. No. 319,606
13 Claims. (Cl. 315—39.3)

4. A electron discharge device comprising an interaction region bounded by a slow wave structure and a sole electrode, an electron gun positioned at one end of said interaction region for injecting an electron beam into said interaction region, and first and second collector electrodes having mutually facing surfaces positioned at the other end of said interaction region to define a collector region, the distance between said mutually facing surfaces increasing in the direction away from said interaction region over at least a portion of the length of said collector region.



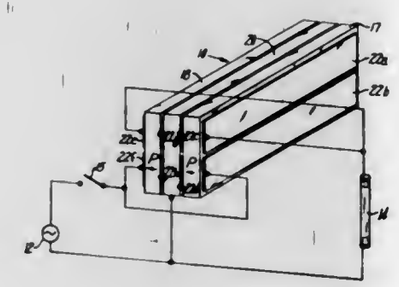
3,271,619
TRIGGERED VACUUM DISCHARGE DEVICE.
James M. Lafferty, Schenectady, N.Y., assignor to General Electric Company, a corporation of New York
Filed July 26, 1963, Ser. No. 297,924
5 Claims. (Cl. 315—111)

1. A triggered vacuum discharge device comprising:
(a) an evacuated, hermetically sealed envelope;
(b) a pair of primary discharge electrodes located within said envelope comprising rings lying in parallel planes and defining a primary gap therebetween;
(c) trigger means located within the area encompassed by said rings for enabling the initiation of a primary discharge therebetween, said trigger means including:
(aa) a trigger gap defined by spaced electrically insulated trigger surfaces on a non-conducting body, each said surface comprising a charged gas-absorbent metal coating;
(bb) said trigger gap being located between said planes of said rings;



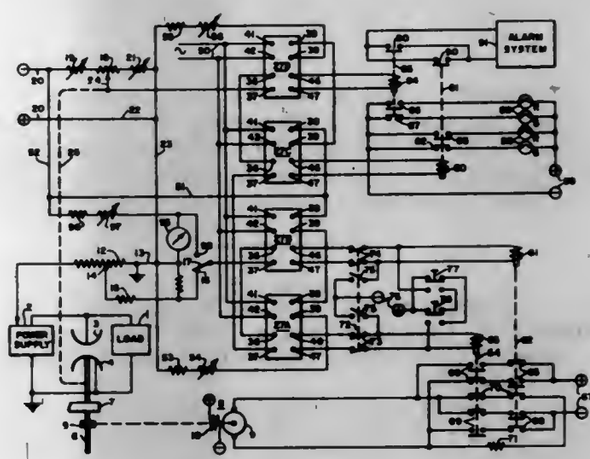
(d) means for applying a triggering potential to said trigger surfaces for establishing a trigger discharge therebetween to release and ionize said gas absorbed in said metal coating; and
(e) means for applying a voltage to said primary electrodes to establish an electric field therebetween so that the release and ionization of said gas by said trigger discharge is effective to initiate a discharge between said primary electrodes.

3,271,620
STARTING CIRCUIT FOR VAPOR LAMPS AND THE LIKE
James E. Webb, Administrator of the National Aeronautics and Space Administration with respect to an invention of John E. Guisinger
Filed Oct. 1, 1963, Ser. No. 313,136
8 Claims. (Cl. 315—160)



1. In combination with a load defining a substantially open circuit condition prior to the application of a high voltage high frequency signal thereacross and a substantially short circuit condition subsequent to the application of said high voltage high frequency signal thereacross, an oscillator for generating said high voltage high frequency signal, said oscillator comprising an amplifier having an output terminal, a control input terminal; and a transmission line terminated by said load connected between said output terminal and said control input terminal, and means responsive to the establishment of said substantially short circuit condition for maintaining said load in that condition.

3,271,621
BATTERY OPERATED FLASHER
Julian A. McDermott, 1639 Stephen St., New York, N.Y.
Filed Mar. 15, 1961, Ser. No. 141,925
5 Claims. (Cl. 315—210)

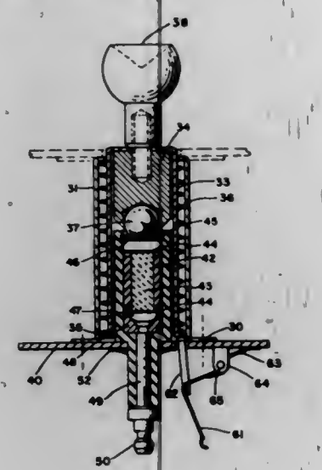


5. In a device to flash lamps including an actuating power source, actuating circuitry and devices connected in series between said power source and a lamp, said circuitry and devices being current responsive to close a circuit providing current directly to said lamp, said circuitry and devices also being responsive to simultaneously connect said circuitry and devices in parallel with said lamp and said circuitry and devices including a current actuated intermittent current interupting means.

3,271,622
PIEZOELECTRIC BALLAST APPARATUS
Robert F. Malagodi, Boston, Mass., and Peter H. Fowler, Midland Park, N.J., assignors to Arthur D. Little, Inc., Cambridge, Mass., a corporation of Massachusetts
Filed July 5, 1963, Ser. No. 293,006
10 Claims. (Cl. 315—246)

1. Ballast apparatus for starting and operating a "rapid start" flourescent lamp from an alternating current supply comprising a flourescent lamp having heater filaments at each end thereof, a pair of piezoelectric sheets each sheet having first, second and third spaced electrodes on one surface thereof and fourth and fifth electrodes on the opposite surface thereof, the first and second electrodes being located opposite the fourth electrode and the third electrode being located opposite the fifth electrode, each sheet being oppositely polarized in the thickness direction, means securing the fourth and fifth electrode sides of the sheets together with the electrodes insulated from each other to forcibly constrain the sheets for movement together, the body formed by the joined sheets being mechanically resonant at the approximate frequency of the alternating current supply, means connecting one of the lamp heater filaments between third electrode of each sheet and the fifth electrode of each sheet, means connecting the other lamp heater filament between the second electrode of each sheet and the fourth electrode of each sheet, means for connecting the first and fourth electrodes of each sheet to the alternating current supply whereby on each one-half cycle of applied alternating current voltage, the electrostatic field between the electrodes connected to the alternating current supply is in the same direction as the polarization of one sheet and opposite to the direction of the polarization of the other sheet thereby to bend the composite body and generate the lamp ignition voltage between the third and fourth electrodes and the lamp preheat current between the third and fifth and between the second and fourth electrodes respectively, the load current of the lamp being limited by alteration of the resonant frequency characteristics of the composite body caused by build-up of lamp current after ignition.

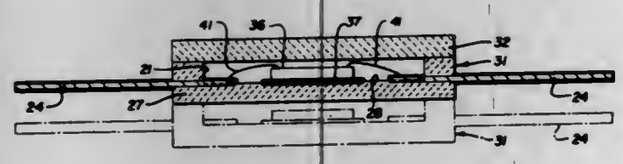
3,271,623
DISCHARGE GAP WITH SPACING VARIED DIRECTLY WITH SUPPLY VOLTAGE
Tom L. Dyer, Jr., Norman K. Osmundsen, and John B. Brittain, Bloomington, and Robert T. Innis, Ellettsville, Ind., and Daniel L. Whitehead, Export, Pa., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed Aug. 31, 1962, Ser. No. 220,676
6 Claims. (Cl. 315—357)



3. A discharge gap device protecting a load connected to a source of supply voltage, the magnitude of which varies over a wide range of voltages under normal operating conditions, said gap device including a pair of electrodes forming a discharge gap connected across the load device, means for sensing changes in the voltage magnitude of said source and producing a signal in response thereto, means for moving at least one of said electrodes to change the spacing of the gap in response to said signal, the movement of said electrode maintaining a predetermined relation between the gap spacing and the magnitude of the supply voltage.

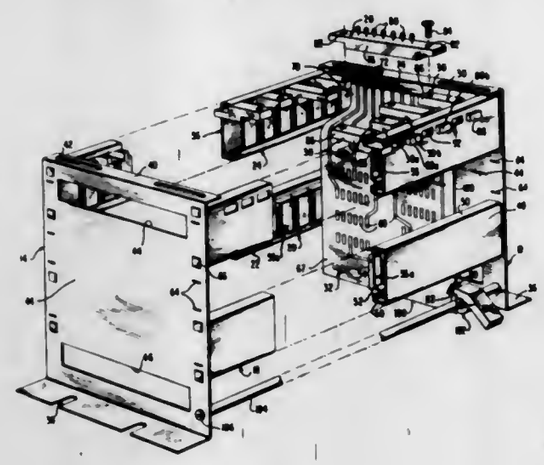
3,271,624
APPARATUS FOR PRODUCING ELECTRIC IMPULSES
Cornelis Sacharias Johannes Kingma, Baambrugge, and Pieter Smid, Haarlem, Netherlands, assignors to Honeywell G.m.b.H., Frankfurt am Main, Germany, a corporation of Germany
Filed May 7, 1964, Ser. No. 365,705
Claims priority, application Germany, May 24, 1963, H 49,251
3 Claims. (Cl. 317—81)

1. A piezoelectric spark ignitor, comprising:
a piezoelectric crystal having an axis along which a force is to be applied to generate a high voltage, said crystal having a pair of end faces at spaced ends along said axis,
a metallic impact plate mounted to engage one of said end faces and having a surface generally normal to said axis,



self aligning support members having mating curved sufaces and having a surface to engage the other of said end faces,

means prestressing said crystal between said plate and said support members,

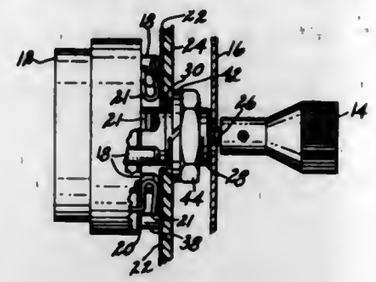


a hammer having a ball-like member spring biased against said plate and engaging the same at a point, and switch means actuated by movement of said hammer away from said plate to short circuit said crystal prior to striking of said plate by said hammer.

3,271,625
ELECTRONIC PACKAGE ASSEMBLY
Edward A. Caracciolo, Santa Clara, Calif., assignor to Signetics Corporation, Sunnyvale, Calif., a corporation of California
Filed Dec. 9, 1963, Ser. No. 329,190
1 Claim. (Cl. 317—101)

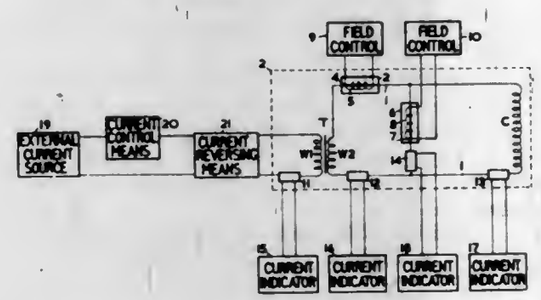
In an electronic package assembly adapted to receive a semiconductor device having contact areas, a body, a plurality of conducting metallic leads having inner and outer end portions, the inner end portions of the leads being embedded in the body and having exposed upper surfaces, the outer end portions of the leads extending outwardly away from the body and being free of the body, portions of the leads intermediate the inner and outer end portions being surrounded on all sides by the body, at least the portion of the body in contact with and surrounding the leads being formed of a material having a coefficient of expansion which is substantially identical to that of the leads and serving to electrically insulate the leads from each other, all portions of said leads in said body being in physical contact with and supported by said body, the exposed upper surfaces of the inner portions of the leads lying in a substantially common plane and being disposed in a predetermined pattern adjacent the perimeter of the body, a substantially planar metal conducting pad mounted on the body in a generally central position and being out of contact with at least certain of the exposed upper surfaces of the inner end portions of the leads, said body being adapted to receive the semiconductor device so that the semiconductor device can be mounted directly upon the pad and so that the contact areas of the semiconductor device can be connected to the upper exposed surfaces of the inner portions of the leads, cover means mounted on said body and means forming a hermetic seal between the cover means and the body so that a semiconductor device mounted in the body is hermetically sealed therein, said body having a substantially planar outer surface and said cover means having a substantially planar outer surface parallel to the outer surface of the body to permit one package to be stacked with another package with surfaces in juxtaposition.

3,271,626
PRINTED CIRCUIT CARD RACK
Patrick P. Howrilka, 521 Lowell Drive, Endwell, N.Y.
Filed Dec. 31, 1964, Ser. No. 422,791
9 Claims. (Cl. 317—101)



1. An improved rack assembly for housing printed circuit cards having terminal ends carrying spaced conductive terminal leads, said assembly comprising: a pair of spaced end plates, at least one pair of oppositely oriented bars positioned longitudinally between said end plates and affixed thereto, said bars being of channel-like configuration and having the channels directed inwardly toward each other, said channels extending longitudinally of said bars at right angles to said spaced end plates, molded, unitary card spacers carried by each channel-like bar, each of said card spacers being restrained by said bar against transverse movement but slidable longitudinally therein, each spacer extending substantially the entire length of its respective channel, said spacers further being provided with serrated surfaces which protrude from said channels with said serrations acting to receive and guide inserted printed circuit cards, card connectors and means for fixedly positioning said card connectors on said assembly with the terminal ends of said cards coupled to said connectors in circuit completing relationship.

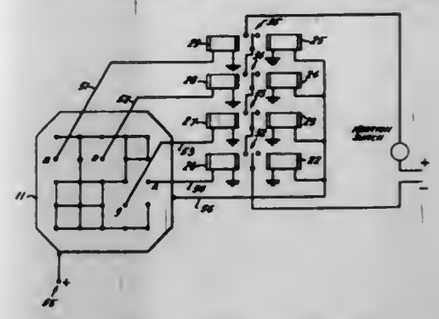
3,271,627
ARRANGEMENT FOR CONNECTING ELECTRICAL CONTROLS TO PRINTED CIRCUITS
John A. McDougal, Flint, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 29, 1964, Ser. No. 421,891
10 Claims. (Cl. 317—112)



1. In combination, a panel including a printed circuit, an electrical control device disposed on one side of said panel, said control device having a plurality of rigid

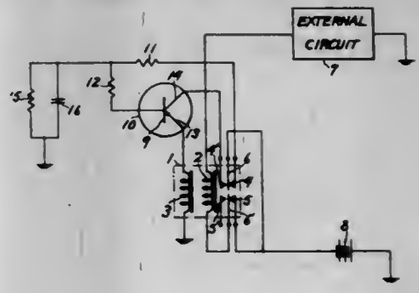
contacts and a plurality of resilient contacts engaging said printed circuit conductors, and resilient means on

an opposite side of said panel for urging said rigid and resilient contacts into tight engagement with said printed circuit conductors.



3,271,628
SUPERCONDUCTIVE CIRCUIT ARRANGEMENTS
Arthur Cunningham Prior, Malvern, England, assignor to National Research Development Corporation, London, England
Filed May 20, 1963, Ser. No. 281,450
Claims priority, application Great Britain, May 22, 1962, 19,650/62; Aug. 21, 1962, 32,030/62
10 Claims. (Cl. 317—123)

1. A method of producing enhanced circulating currents in a superconductive circuit comprises the steps of connecting the superconductive circuit in series with a second superconductive circuit, inducing a circulating current in the first and second circuits in series by means of inducing means coupled thereto, localising induced currents in the first and second circuits by short circuiting the first and second circuits with a superconductive link, rendering the second circuit non-superconductive to permit readjustment of the inducing means, restoring the second circuit to its superconductive state, rendering the superconductive link non-superconductive and, inducing a further current in the two circuits in series to aid the circulating current remaining after the short-circuit current has ceased to flow.

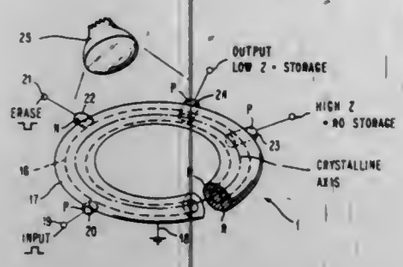


3,271,629
CODED ELECTRIC LOCKING MECHANISM
Stephan Holy, 431 E. 9th St., New York, N.Y.
Filed July 1, 1965, Ser. No. 468,854
1 Claim. (Cl. 317—134)

A coded electrical combination lock comprising, a plurality of electromagnetic relays each having first and second energization coils and each having first and second electrical contacts, said relays being of the type having a pivotal bar whereby energization of the first coil will cause said pivotal bar to close first and second contacts and energization of said second coil will open said contacts, said relays including holding means whereby the pivotal bar will remain in the condition associated with the energization of each respective coil until the subsequent energization of the opposite coil, all of said first and second contacts being in series with a utilization circuit, a plurality of push buttons each having a first and second contact, a first group of said push buttons electrically arranged in such a manner so that to depress any one would energize all of said second relay coils, a second group of said push buttons electrically arranged so that each one will energize a respective first coil of each

of the plurality of said relays so that when every one of said second group of push buttons is depressed the utilization circuit is complete, and if any one of said first group of push buttons is depressed before all of said second group of push buttons, all of said second coils will be energized and the utilization circuit will be opened.

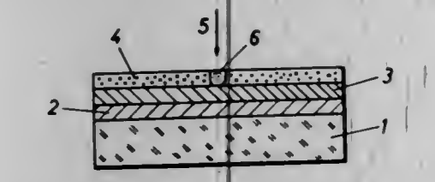
3,271,630
OVERCURRENT INTERRUPTING APPARATUS
Kazumichi Miyazawa, Kawasakishi, Japan, assignor to Torio Company, Limited, Tokyo, Japan, a company of Japan
Filed June 11, 1963, Ser. No. 287,072
2 Claims. (Cl. 317—155)



1. An overcurrent interrupting apparatus comprising a relay which consists of a main coil, a holding coil, two pairs of contacts and a pair of armatures, a direct current source which is connected to said main coil through one of said armatures and one of said contacts, a transistor, to the base of which a bias voltage is given by said source through another armature and one of said contacts as well as two resistors, the emitter of said transistor being earthed through said holding coil and the collector of said transistor being connected to one of opened contacts, and a parallel circuit consisting of a resistor and a condenser for providing a suitable time constant, one end of which is connected to the connection point of said two resistors, the other end of said parallel circuit being earthed.

3,271,631
UNIAXIAL CRYSTAL SIGNAL DEVICE
John C. Marinace, Yorktown Heights, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed May 8, 1962, Ser. No. 193,125
6 Claims. (Cl. 317—234)

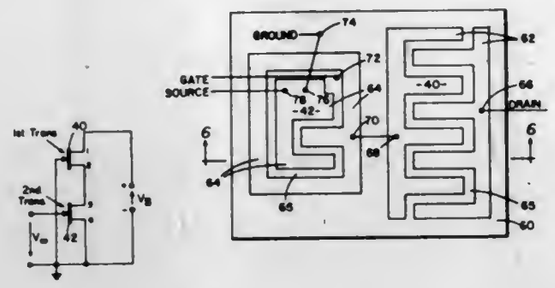
1. A semiconductor device comprising:



(a) a toroidal semiconductor element comprising a semiconductor crystal whisker shaped in toroidal form and epitaxially joined at its ends;

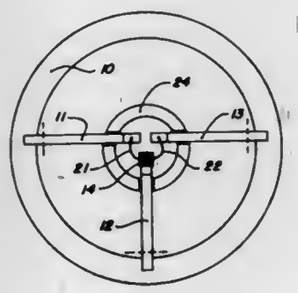
(b) said whisker having a single crystalline axis following the curvature of said toroid;
(c) said element including a central core portion of a first conductivity type and an outer skin portion of a second conductivity type joined together at a first semiconductor junction surrounding said central core portion;

(d) an input for said device comprising a second semiconductor junction formed in said outer skin portion of said device;
(e) and an output means for said device extending through said outer skin portion to said central core portion of said element.



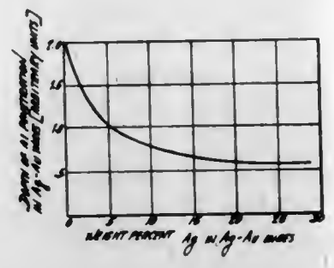
3,271,632
METHOD OF PRODUCING ELECTRICAL SEMICONDUCTOR DEVICES
Horst Joachim Hartmann, Nurnberg, Germany, assignor to International Standard Electric Corporation, New York, N.Y., a corporation of Delaware
Filed May 18, 1962, Ser. No. 195,805
Claims priority, application Germany, May 26, 1961, St 17,870
12 Claims. (Cl. 317—234)

1. A semiconductor device comprising a layer of crystalline semiconductor material of one conductivity type, a protective insulating layer of amorphous semicondutor material of another conductivity type deposited thereon, a predetermined limited surface area of said amorphous layer comprising a re-crystallized solidified melt zone of said other conductivity type forming an electrode extending through the full thickness of said amorphous layer in contact with and of the same orientation as said crystalline layer of said one conductivity type and forming a PN-junction therewith.



3,271,633
INTEGRATED FIELD EFFECT DEVICE WITH SERIES CONNECTED CHANNEL
Geza Csanky, Mesa, Ariz., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois
Filed Jan. 29, 1963, Ser. No. 254,652
6 Claims. (Cl. 317—234)

2. Transistor means including in combination: a first field effect transistor having a first region and a second region, first and second contact means affixed to said first region for producing a current flow therethrough, a first gate contact means affixed to said second region for controlling the current flow through said first region; a second field effect transistor having a first region and a second region, third and fourth contact means affixed to said first region of said second transistor for producing a current flow therethrough, and a second gate contact means affixed to said second region of said second transistor for controlling the current flow through said first region thereof, said second field effect transistor having a lower pinch-off current point than said first transistor; means connecting said second contact means



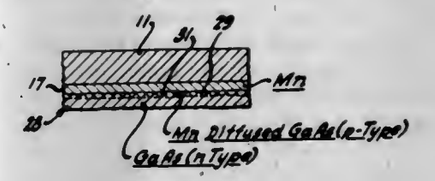
to said third contact means to place said first regions of said first and second transistors in series; means connecting said first gate contact means to said fourth contact means; means for introducing a unidirectional exciting potential across said first and fourth contact means; and means for introducing an input signal between said second gate contact means and said fourth contact means.

3,271,634
GLASS-ENCASED SEMICONDUCTOR
William R. Heaton, Richardson, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware
Filed Oct. 20, 1961, Ser. No. 146,590
4 Claims. (Cl. 317—234)

1. A semiconductor device comprising a wafer of monocrystalline semiconductor material having regions of opposite conductivity types therein, a hard glass, cup-like shell composed of a glass having a given thermal expansion coefficient and a given softening point, a first conductive member extending through a notch in the vertical wall of said shell into the interior of said shell, said wafer being positioned on said first conductive member within said shell to provide electrical contact to said wafer in a region of one conductivity type, a second conductive member extending through a second notch in the vertical wall of said shell into the interior of said shell, a thin conductive lead connecting a region of said wafer at the opposite conductivity type to said second conductive member within the shell, and a casing of solder glass filling said shell and surrounding said wafer and the portions of said conductive members which are within the shell, said casing being composed of a fused glass powder having a softening point much lower than that of said shell and having a thermal expansion coefficient substantially equal to that of said shell.

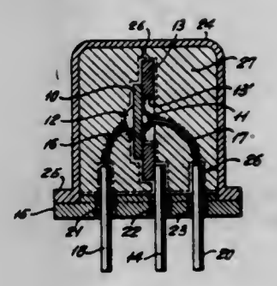
3,271,635
SEMICONDUCTOR DEVICES WITH SILVER-GOLD LEAD WIRES ATTACHED TO ALUMINUM CONTACTS
Robert Wagner, Levittown, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed May 6, 1963, Ser. No. 278,240
3 Claims. (Cl. 317—234)

1. A semiconductor device comprising a crystalline semiconductive wafer; at least one metallic contact comprising aluminum on a portion of said wafer; and an electrical lead wire attached to said contact, said wire consisting essentially of 5 to 25 weight percent silver, balance gold.



3,271,636
GALLIUM ARSENIDE SEMICONDUCTOR DIODE AND METHOD
John C. Irvin, Berkeley Heights, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed May 13, 1963, Ser. No. 279,788
4 Claims. (Cl. 317—234)

2. A high frequency capacitive semiconductor diode comprising a wafer of gallium arsenide semiconductor material having a rectifying surface barrier comprising a thin layer of gold of limited extent on said wafer surface, an element of silver in contact with said gold layer and coextensive therewith said silver element being in low resistance electrical contact with said rectifying surface barrier with substantially no penetration of said surface barrier, a second thin layer of gold overlying said silver element, and a conductive member in contact with said second thin overlayer of gold.

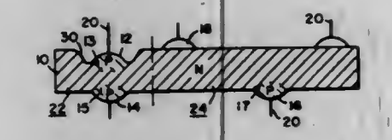


3,271,637
GaAs SOLAR DETECTOR USING MANGANESE AS A DOPING AGENT
James E. Webb, Administrator of the National Aeronautics and Space Administration with respect to an invention of Edward F. Pasierb
Filed July 22, 1963, Ser. No. 296,879
1 Claim. (Cl. 317—234)

A semiconductor device comprising: a molybdenum backing member; a manganese substrate dopant on said member, the dopant having a thickness of less than one micron; and a film of gallium arsenide on said substrate,

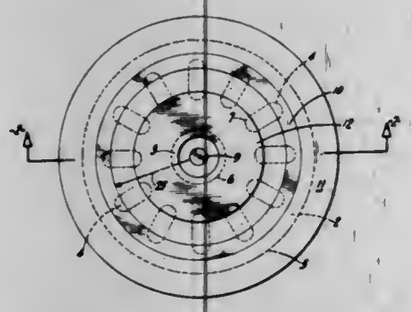
the film and substrate providing an electrical p-type junction at the interface thereof.

3,271,638
ENCASED SEMICONDUCTOR WITH HEAT CONDUCTIVE AND PROTECTIVE INSULATIVE ENCAPSULATION
Emil M. Murad, 4011 E. 1st St., Long Beach, Calif.
Filed Nov. 4, 1963, Ser. No. 323,190
1 Claim. (Cl. 317—234)



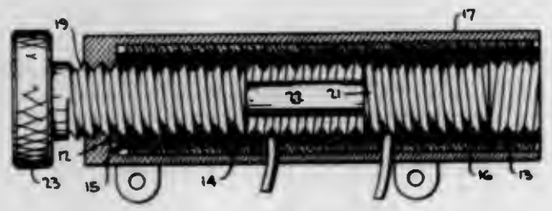
A semiconductor device comprising an element of semiconductor material including at least two regions of different conductivity type forming a PN junction, supporting means for said element, a metallic casing hermetically enclosing said element and electrical terminal means insulatingly mounted in said casing and connecting said regions of different conductivity with the outside of said casing; the improvement consisting in the provision of heat-conducting insulating layer directly upon said element, said supporting means and the portions of said terminal means located within said casing, and a solid body of heat-conducting and neutron and gamma ray absorbing encapsulant consisting of a eutectic alloy having a melting point lower than both the softening point of said insulating layer and the critical temperature substantially affecting irreversibly the electrical operating characteristics of said semiconductor material, said body completely filling the space enclosed by said layer and the inside of said casing, to provide a continuous thermal conducting path from said element to said casing, said insulating layer consisting of a thermoplastic resin containing a finely divided filler of high thermal conductivity, said filler consisting of about 80% by weight of micron-sized particles of mica.

3,271,639
INTEGRATED CIRCUIT STRUCTURES INCLUDING UNIJUNCTION TRANSISTORS
Angel G. Jordan, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed Mar. 10, 1961, Ser. No. 94,867
2 Claims. (Cl. 317—235)



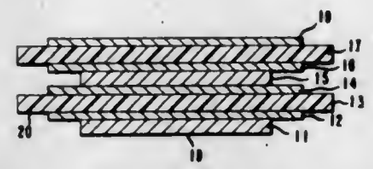
1. A monolithic semiconductor device suitable for use in a tuned amplifier circuit comprising: a first region of semiconductive material of a first type of semiconductivity having first and second integral and continuous portions; second and third regions of semiconductive material of a second type of semiconductivity disposed on opposite sur-

faces of said first portion only of said first region and forming first and second p-n junctions therewith; a fourth region of semiconductive material of said second type semiconductivity disposed on a surface of said second portion of said first region and forming a third p-n junction therewith; first and second ohmic contacts disposed on a surface of said second portion of said first region with said fourth region therebetween so that the path of flow of



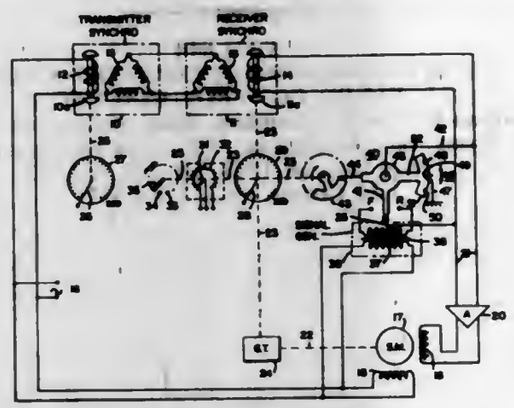
electrical current between said ohmic contacts extends past said third p-n junction; said first portion of said first region and said second and third regions thereby forming the functional equivalent of a bipolar transistor; said second portion of said first region, said fourth region and said first and second ohmic contacts thereby forming the functional equivalent of a unijunction transistor having a common semiconductive region with said bipolar transistor functional equivalent.

3,271,640
SEMICONDUCTOR TETRODE
Gordon E. Moore, Los Altos Hills, Calif., assignor to Fairchild Camera and Instrument Corporation, Syosset, N.Y., a corporation of Delaware
Filed Oct. 11, 1962, Ser. No. 229,839
11 Claims. (Cl. 317—235)



1. A semiconductor device comprising a body of semiconductor having:
a first region of one conductivity type,
a second region of the opposite conductivity type disposed within said first region, extending inwardly from one of the surfaces of said first region and forming a first PN junction with said first region having an edge at the surface of said body of semiconductor,
a third region forming a second PN junction with the opposite surface of said first region, said second PN junction also having an edge at said surface of said body of semiconductor,
an alignment of spaced-apart regions of said opposite conductivity type disposed within said first region extending inwardly from its surface and forming an alignment of PN junctions therewith which have edges at said surface of said body of semiconductor, said edges all lying between said edges of said first and second PN junctions,
a surface channel region adjacent to said first region and extending between said first PN junction and said alignment of PN junctions,
a control electrode capacitatively coupled to the semiconductor in spaced relationship to said surface channel region and the edges of said first PN junction and said alignment of PN junctions, said electrode adapted to change the conductivity type of said surface channel in response to a change in the potential at said electrode, and
means for passing electric current across said first and said second PN junctions.

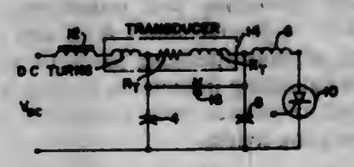
3,271,641
VARIABLE CAPACITOR
Allan M. Biggar, Arlington, Va., and Maurice Apstein, Bethesda, Md., assignors to the United States of America as represented by the Secretary of the Army
Filed Apr. 1, 1965, Ser. No. 444,877
8 Claims. (Cl. 317—249)



1. A subminiature variable capacitor comprising:
(a) a movable electrode in the form of a continuous screw,
(b) a first thin film of insulating material approximately conforming to the threaded surface of said electrode,
(c) a second thin film of insulating material approximately conforming to said threaded surface and being in superposition with respect to said first film,
(d) a fixed electrode approximately conforming to said threaded surface and being locked in place between said first and second films,
(e) said first film maintaining close contact with said threaded surface but permitting movement thereof,
(f) said first film serving as the dielectric between said fixed electrode and said movable electrode, and
(g) a tubular metallic shield can surrounding said second film.

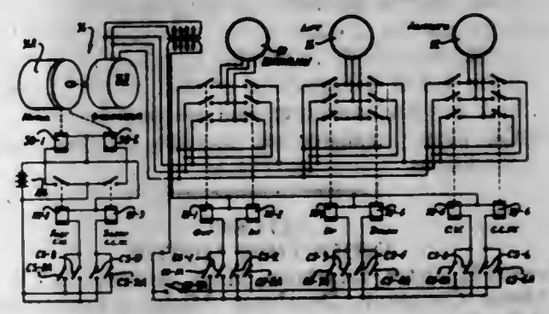
3,271,642
ELECTRICAL CAPACITORS
Louis Vincent Baldwin, Hockessin, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Nov. 4, 1965, Ser. No. 513,629
3 Claims. (Cl. 317—260)

1. An electrical capacitor comprising a convolutely wound laminar structure comprising at least two strips of a metal foil and at least two strips of a sheet dielectric, said foil strips and said dielectric strips being arranged respectively in alternate layers, said dielectric strips having deposited on both sides thereof a layer of metal, said layers of metal being adjacent and in electrical contact with said foil strips and extending beyond the lateral edges of said foil strips, said foil strips having means to couple each respectively to an external electrical circuit, said laminar structure being immersed in a dielectric material contained in a casing adapted to envelope said laminar structure.



3,271,643
LIMIT STOP CONTROL FOR SYNCHRO SYSTEM
Frederick J. Lingel, Lynnfield, Mass., assignor to General Electric Company, a corporation of New York
Filed Dec. 23, 1963, Ser. No. 332,749
8 Claims. (Cl. 318—30)

1. In an electric servomotor system,
a transmitter synchro having a rotor,
a receiver synchro electrically connected to the transmitter synchro and having a rotor with an output winding in which a reversible polarity voltage is induced,
a reversible servomotor connected to drive the receiver synchro rotor,
polarity-senstive electroresponsive means controlling the direction of rotation of the servomotor,
means connecting the receiver synchro output winding to said electroresponsive means so that said servomotor normally drives the receiver synchro rotor to a position corresponding to the position of the transmitter synchro rotor between forward and reverse limits of travel displaced more than 180° but less than 360° of rotary movement of the receiver synchro,
an override signal generator having an output voltage,
means including a reset switch having forward, neutral and reverse positions connecting the override signal generator to the electroresponsive means with a polarity to cause the servomotor to drive the receiver synchro rotor in forward and reverse directions when the reset switch is in the forward and reverse positions, respectively, said override signal generator being disconnected when said reset switch is in the neutral position,
an actuator coupled to rotate with the receiver synchro rotor arranged to engage and actuate the reset switch progressively to the neutral and reverse positions and to the neutral and forward positions as the receiver synchro approaches, respectively, said forward and reverse limits of travel,
and positioning means maintaining said reset switch in said forward, neutral, and reverse positions until actuated to a different position by said actuator when it approaches said forward and reverse limits of travel.

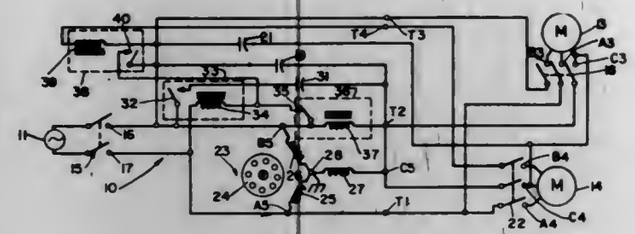


3,271,644
POWER OSCILLATOR FOR AN ELECTROMECHANICAL VIBRATING TRANSDUCER
James L. McShane, Churchill, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Oct. 23, 1963, Ser. No. 318,263
7 Claims. (Cl. 318—114)

5. In combination, a transducer having D.C. windings and A.C. windings and having electrical characteristics functionally related to the load to be driven thereby; an LC circuit including a capacitor member and an inductor member; a constant current source operably connected across said LC circuit; means responsive to the electrical characteristics of said transducer for controlling the frequency at which energy is interchanged in said LC circuit; an effective A.C. load impedance branch including a first capacitor and a second capacitor connected in circuit relation with the A.C. turns of said transducer across said LC circuit; said first capacitor connected in series

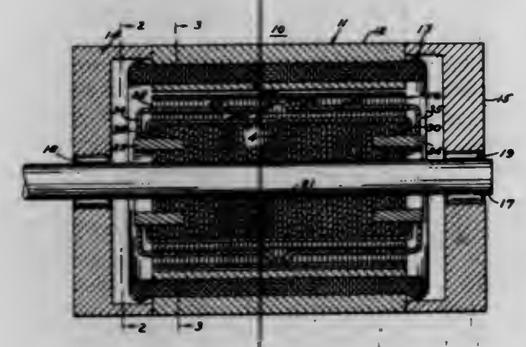
circuit combination with said A.C. turns; and said second capacitor connected across at least part of said A.C. turns; the reactance of said load impedance branch having a magnitude so chosen that the phase angle between the voltage across said capacitor member and the voltage across said power factor capacitor is at a positive rate of change with respect to frequency at the resonant frequency of said transducer.

3,271,645
A.C. GENERATOR-FED VARIABLE FREQUENCY MOTOR CONTROL MECHANISM FOR AN AERIAL LIFT
Jay M. Eitel, Los Altos, Calif., assignor to Telsta Corp., San Carlos, Calif., a corporation of California
Filed Sept. 6, 1962, Ser. No. 221,693
11 Claims. (Cl. 318—148)



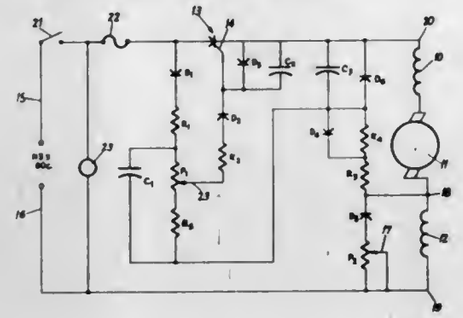
1. In a system for controlling the movement of a boom structure in an aerial lift, first A.-C. motor drive means for rotating the boom structure about a vertical axis, second A.-C. motor drive means for raising and lowering the outer end of the boom structure about a horizontal axis, and third A.-C. drive means for moving the outer end of the boom structure to and fro, a motor generator set having an A.-C. electrical output, and manually operated control means for connecting the electrical output of the motor generator set to the first, second and third drive motors so that the first, second and third drive motors can be selectively energized, said manually operated control means also including means for changing the speed of operation of the motor generator set to change the frequency of the electrical output so that the selected drive motor or motors will be operated at a different speed.

3,271,646
CONVERTER SYSTEMS
Alexander J. Lewus, 1617 S. 47th Court, Cicero, Ill.
Filed July 12, 1965, Ser. No. 470,982
5 Claims. (Cl. 318—218)



1. A converter system for energizing a plurality of three-phase motors or like three-phase operating loads, each having three input terminals A, B and C, from a single-phase power supply having two output terminals, said converter system comprising:
means for connecting a first one of said power supply output terminals to terminal A of each of said loads;

means for connecting the other power supply output terminal to terminal B of each of said loads;
a main de-phasing capacitor;
means for connecting said main capacitor between terminals B and C of each of said loads;
a three-phase rotary transformer having terminals A', B', and C';
means for connecting said transformer terminals A', B' and C' to the terminals A, B and C, respectively, of each of said operating loads to afford a variable current-balancing inductance having a relatively high reactance-resistance ratio connected in parallel with the operating loads;

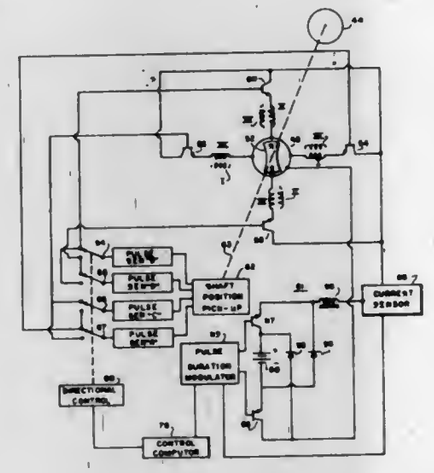


a starting capacitor;
means for automatically connecting said starting capacitor directly in parallel with said main capacitor upon initial energization of one of said loads and for disconnecting said starting capacitor when the load reaches normal operating conditions;
and means for automatically connecting said starting capacitor directly in parallel with said main capacitor upon initial energization of said rotary transformer and for disconnecting said starting capacitor when the rotary transformer reaches normal operating conditions.

3,271,647
INDUCTION MOTOR
Thomas H. Oster, Dearborn, Mich., assignor to The Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Aug. 1, 1963, Ser. No. 299,413
9 Claims. (Cl. 318—234)

9. An induction motor comprising a stator, armature windings carried by said stator and adapted to be energized by a source of electrical energy having a wide range of frequencies, a rotor rotatably mounted in said stator, said rotor carrying a plurality of short circuited conductors, said short circuited conductors having end portions movable in a radial direction, a stationary conductor mounted on said rotor, said end portions electrically and mechanically engaging said stationary conductor, said short circuited conductors including bendable means positioned intermediate the end portions and actuated by centrifugal force for moving said end portions radially outwardly out of engagement with said stationary conductor when said rotor is rotated above a predetermined angular velocity whereby the speed of the rotor is limited to a predetermined maximum level.

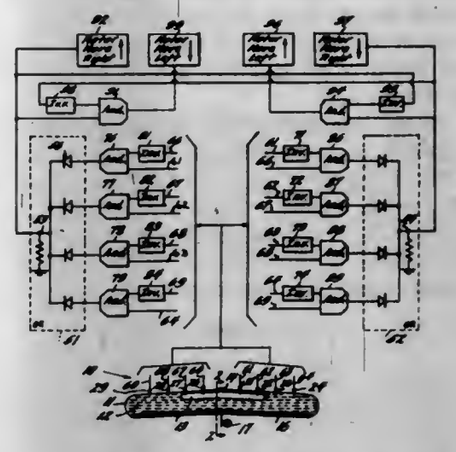
3,271,648
UNIVERSAL-MOTOR COUNTER E.M.F. SPEED CONTROL CIRCUIT
Herman R. Weed, Columbus, Ohio, assignor to Robbins & Myers, Inc., Springfield, Ohio, a corporation of Ohio
Filed Dec. 26, 1963, Ser. No. 333,451
14 Claims. (Cl. 318—331)



1. A circuit for regulating the speed of an electric motor having series connected armature and at least one field winding, comprising:
(a) power leads connected across said motor,
(b) one of said power leads containing in series a controlled rectifying device having a gate terminal, for controlling the flow of current to said motor,
(c) reference circuit means connected effectively across said power leads and to said gate terminal for deriving a reference voltage characterized by a D.-C. component and an A.-C. ripple,
(d) field discharge circuit means connected across said field winding of said motor for producing a unidirectional field current and resultant magnetic field at all times, and
(e) sensing circuit means for deriving an output voltage proportional to the generated voltage of said motor, said last named circuit means being connected between the cathode of said controlled rectifying device and said reference circuit means, and of a polarity tending to oppose the portion of said reference voltage applied to the gate of said controlled rectifying device,
whereby the difference in voltage between said reference voltage and said output voltage determines the firing point of said controlled rectifying device.

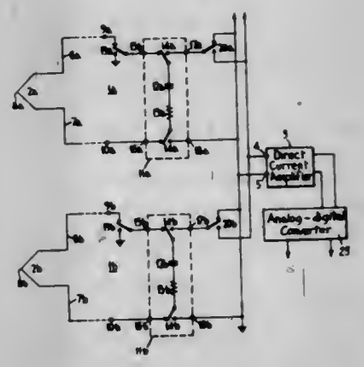
3,271,649
REGENERATIVE BRAKING SYSTEM
Klaus Juergensen, Huntsville, Ala., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Sept. 6, 1963, Ser. No. 307,270
15 Claims. (Cl. 318—376)

1. A direct current bilateral energy transfer system comprising:
(A) a source of direct current having first and second terminals;
(B) electromechanical means comprising first and second electrical terminals and a mechanically moving element and means for interchanging energy between said electrical terminals and moving element;
(C) a first electrical circuit interconnecting said first terminal of said source and said first terminal of said electromechanical means and including in series first switching means and an inductor,



(1) said first switching means comprising means for controllably opening and closing said first electrical circuit;
(D) a second electrical circuit interconnecting said second terminal of said source and said second terminal of said electromechanical means and including in series second switching means,
(1) said second switching means comprising means for controllably opening and closing said second electrical circuit;
(E) a first unidirectional conducting circuit connected between said first terminal of said source and said second terminal of said electromechanical means and poled to permit current flow only from said last named second terminal to said last named first terminal;

(F) a second unidirectional conducting circuit connected between said second terminal of said source and a point on said first electrical circuit between said first switching means and said inductor and poled to permit current flow only from said last named second terminal to said point on said electrical circuit; and
(G) and switch control means having first and second control modes, said switch control means being operative in said first control mode to actuate said first and said second switching means whereby said electromechanical means is permitted to assume a motoring state, said switch control means being operative in said second control mode to actuate said first and said second switching means whereby said electromechanical means is permitted by said first and second unidirectional conducting circuits to assume a generating state.



3,271,650
SYSTEM FOR MAINTAINING AN OBJECT IN A PREDETERMINED REFERENCE PLANE
Richard L. Riddle, El Paso, Tex., assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York
Filed Sept. 24, 1963, Ser. No. 311,251
3 Claims. (Cl. 318—489)

1. In a system for maintaining an object in a predetermined reference plane,
a level sensor unit, having a plurality of output electrodes, for sensing when the object deviates from the reference plane and for developing binary output voltages at its output electrodes indicative of the deviation,
a pair of gate circuits coupled respectively to each output electrode of the level sensor unit and responsive to the binary voltages developed by the sensor unit for developing binary form output voltages indicative of the object movement necessary to restore the object to the reference plane, and

means responsive to the binary form output voltages of the gate circuits for restoring the object to the reference plane.

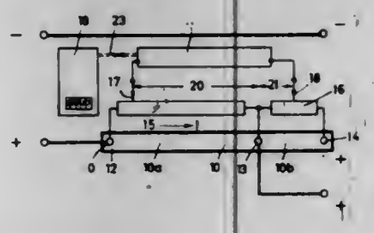
3,271,651
SIGNAL TRANSFER APPARATUS INCORPORATING MEANS TO SUPPRESS SPURIOUS INTERFERENCE SIGNALS
Pierre Diederich, Harpenden, England, assignor to International Systems Control Limited, Wembley, England
Filed Sept. 23, 1963, Ser. No. 310,797
Claims priority, application Great Britain, Sept. 24, 1962, 36,257/62
9 Claims. (Cl. 320—1)

5. A signal transfer apparatus for applying to a voltage responsive means a potential difference representative of the output of a voltage generating means, said apparatus comprising:
(A) a first pair of terminals to which is applied said potential difference representative of the output of the voltage generating means;
(B) a second pair of terminals between which the voltage responsive means is connected;
(C) an impedance path including a capacitative element; and
(D) a first switch means having a set of contacts which, in a first condition of the switch means serves to connect said impedance path between the first pair of terminals, and in a second condition of said switch means, serves to connect said impedance path between the second pair of terminals,

(I) said set of contacts providing stray capacitances between the first pair of terminals and the second pair of terminals, and

(E) a second switch means having a set of contacts which serves to connect one of said first pair of terminals to a point of fixed potential when said first switch means is in its second condition and to disconnect said one of the first pair of terminals from said point when said first switch means is in its first condition; and

(F) means connecting the one of the second pair of terminals corresponding to the other of said first pair of terminals to a point of fixed potential when said first switch means is in its second condition,



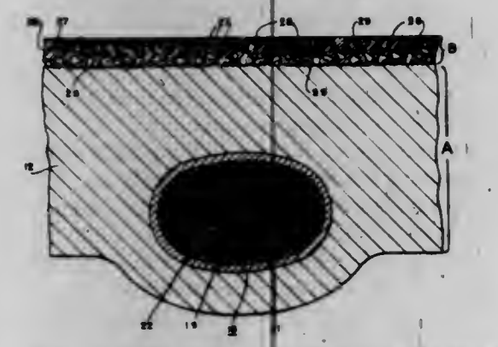
(G) whereby one end of each stray capacitance is maintained at a fixed potential at least when the first switch means is in its second condition.

3,271,652

SUPERVISORY BATTERY CHARGER RESPONSIVE TO THE NUMBER OF CHARGE-DISCHARGE CYCLES

Alfred Walz, Emmendingen, Baden, and Robert Östreicher, Teningen, Baden, Germany, assignors to Messrs. Frako Kondensatoren- und Apparatebau Gesellschaft mit beschrankter Haftung, Teningen, Baden, Germany, a corporation of Germany

Filed July 9, 1963, Ser. No. 293,733
Claims priority, application Germany, July 11, 1962, F 37,293
20 Claims. (Cl. 320—44)



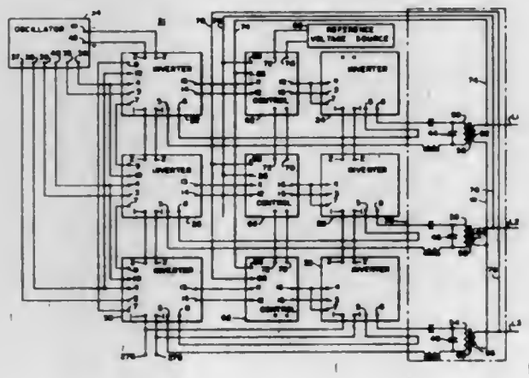
1. In combination with an electric storage battery, having a nominal capacity, and an electric charger therefor: supervisory means comprising an ampere hour measuring means electrically connected to said battery to measure the state of charge thereof; a first counter operable by said measuring means; and a second counter operatively associated with said measuring means to count the charging cycles of said battery.

3,271,653

NON-STICK METALLIC COOKING VESSEL

Robert M. Wolf, Mansfield, Ohio, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Filed Aug. 22, 1961, Ser. No. 133,103
1 Claim. (Cl. 220—64)



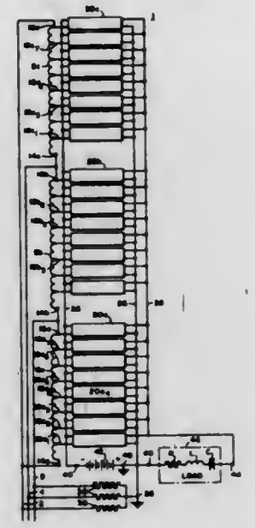
A metallic cooking vessel having a cooking surface consisting of a thin porous layer of aluminum permanently united to the base metal of the vessel, said base metal being aluminum and said thin porous aluminum layer being impregnated with a permanent non-stick agent and the food engaging surface of said impregnated porous aluminum layer comprising minute areas of the porous aluminum surrounded by areas of the non-stick agent.

3,271,654

APPARATUS FOR REGULATING THE PHASE AND MAGNITUDE OF THE OUTPUT VOLTAGE OF A POLYPHASE INVERTER

Leland A. Schlabach, Wilkins Township, Allegheny County, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

Filed Jan. 25, 1963, Ser. No. 253,814
15 Claims. (Cl. 321—5)



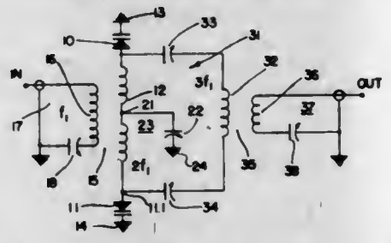
1. In a three-phase voltage generating apparatus; three output terminals; three alternating voltage generating devices having output connections and input connections, means connecting said output connections in Y to said output terminals whereby one of said output connections of each of said devices are connected together and the other of said output connections of said devices are individually connected to said output terminals; each said device comprising a first inverter, a second inverter, a control network for determining the phase difference in the alternating voltages generated by its said first and second inverters, and means connecting the output voltages of its said first and second inverters in series circuit to its said output connections; first means responsive to a first voltage appearing between a first and a second of said output terminals; a first of said devices being the one of said devices connected to said first output terminal and a second of said devices being the one of said devices connected to said second output terminal, said first means being connected to said control network of said first device for actuating said control network of said first device to regulate the phase difference between said first and said second inverters of said first device as a function of said first voltage; means responsive to a second voltage appearing between said second output terminal and the third of said output terminals and connected to said control network of said second device for actuating said control network of said second device to regulate the phase difference between said first and said second inverters of said second device as a function of said second voltage; the third of said devices being the one of said devices connected to said third output terminal; and means responsive to a third voltage appearing between said third output terminal and said first output terminal and connected to said control network of said third device for actuating said control network of said third device to regulate the phase difference between said first and said second inverters of said third device as a function of said third voltage.

3,271,655

APPARATUS FOR GENERATING A PLURALITY OF PHASE DISPLACED PERIODIC ELECTRICAL QUANTITIES

Seymour Salowe, West Caldwell, and Warren J. Schmidt, Upper Montclair, N.J., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Filed Mar. 8, 1962, Ser. No. 178,324
20 Claims. (Cl. 321—7)



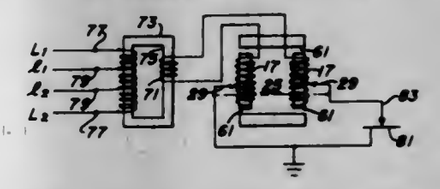
1. In a network for generating periodic electrical quantities, a source of polyphase alternating potential of a first frequency, a plurality of inductors, each said inductor having end taps and at least one intermediate tap, means individually connecting said end taps of said inductors in mesh configuration across the phases of said source, a plurality of impedance devices, means connecting said devices in star connection across the phases of said source to provide a neutral connection, a pair of input terminals, a pair of output terminals, circuit means connecting said input terminals and said output terminals, and including a switching means regulating the flow of energy through said circuit means as a function of the polarity of the potential applied thereto, said switching means including a control means for controlling the initiation of current flow therethrough, said control means being connected between said neutral connection and each of said taps for actuating said switching means at a desired phase angle of the voltage between said neutral connection and each of said taps to provide a sequence of pulses at said output terminals.

3,271,656

ELECTRIC WAVE FREQUENCY MULTIPLIER

Marion E. Hines, Weston, and Frederick P. Collins, Natick, Mass., assignors to Microwave Associates, Inc., Burlington, Mass., a corporation of Massachusetts

Filed Oct. 1, 1962, Ser. No. 227,341
13 Claims. (Cl. 321—69)



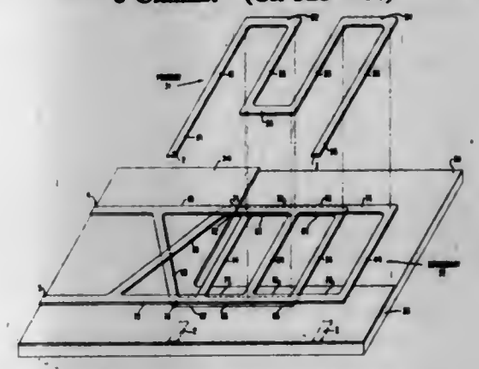
1. Electric circuit for generating from the energy content of an electric wave having a given fundamental frequency a harmonic-frequency wave greater than the second-harmonic, comprising: a pair of non-linear impedance diode means connected in series opposition one to the other, means to apply an input electric wave having said fundamental frequency in push-pull balanced phase across said diode means in series, idler circuit means to derive an electric wave having a frequency which is the second-harmonic of said fundamental frequency from said diode means in parallel with each other, and output circuit means to derive from said diode means an output electric wave having a frequency which is a harmonic of said fundamental frequency greater than said second-harmonic.

3,271,657

WELDING SYSTEMS AND ASSOCIATED ADJUSTABLE WELDING REACTOR

William W. Gibson, Alameda, Calif., assignor, by mesne assignments, to Glenn Pacific Corporation, a corporation of California

Original application Sept. 29, 1958, Ser. No. 763,989, now Patent No. 3,212,040, dated Oct. 12, 1965. Divided and this application June 23, 1965, Ser. No. 466,400
3 Claims. (Cl. 323—44)



1. A welding circuit comprising means for reducing power line voltage to a welding voltage, an adjustable reactor including a winding on an iron core having air gap space giving said core a reluctance which varies not more than plus or minus 3% from the mean value of current ranging from a minimum value to short circuit current, means for connecting said reactor winding to said voltage reducing means, and an adjustable connection on said reactor winding.

3,271,658

THIN FILM SUPERCONDUCTING TRANSFORMER

Tsung-Hsien Cheng, Croton-on-Hudson, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed May 25, 1962, Ser. No. 197,718
6 Claims. (Cl. 323—44)

1. A composite transformer comprising,

a primary input,

a secondary output,

a plurality of individual transformers, each individual transformer having a primary conductor, and a secondary conductor juxtaposed to said primary conductor, said secondary conductors being divided into first and second groups,

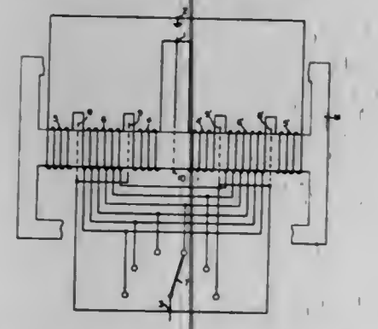
first means connecting said first group of secondary conductors in parallel with said secondary output,

second means connecting said second group of secondary conductors in parallel, said second means being positioned above said first means,

connecting means connecting said second means in parallel with said secondary output so that current

in adjacent secondary conductors flows in opposite directions,

third means connecting said primary conductors in series with said primary input, said means being positioned over said first and said second means, and



a superconductive shield beneath each conductor where the algebraic sum of the short circuit currents in the various layers of circuitry is not zero.

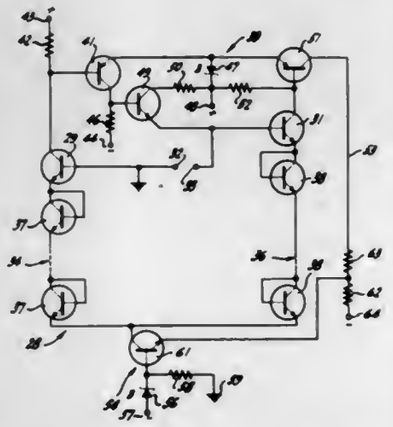
3,271,659

TAP CHANGING AUTOTRANSFORMER

Henri Joseph Philips, Brussels, Belgium, assignor to ACEC Ateliers de Constructions Electriques de Charleroi, Charleroi, Belgium, a corporation of Belgium

Filed May 7, 1963, Ser. No. 278,644
Claims priority, application France, Mar. 27, 1958, 761,650
4 Claims. (Cl. 323—47)

1. In an autotransformer having a high voltage terminal, a grounded terminal alternatively connected to a neutral point and a medium voltage terminal, two alike symmetrically disposed winding halves electrically connected in parallel between said high voltage terminal and said grounded terminal forming the winding of the autotransformer, said winding having two like symmetrically disposed tapped winding sections each in a respective winding half, each having respective taps so any one of several voltages may be selected therefrom and the taps of the two said tapped winding sections being connected in parallel, for each winding half two winding sections disposed on each side of the tapped section and connected in series therewith, two corresponding sections of the halves being connected to the high voltage terminal and the two other corresponding sections being connected to the grounded terminal, for each winding half a pair of electrostatic shields electrically connected to the medium voltage terminal and sandwiching the tapped winding section in their respective winding half, an electrostatic shield electrically connected to the high voltage terminal and disposed between the two corresponding winding sections connected to said high voltage terminal, each of said tapped winding sections comprising a pair of flat coils in series, said winding sections disposed in each half on each side of the tapped section comprising flat coils in series made of spirally wound conductors, the diameters of the different coils increasing progressively as their potential decreases, and switching means electrically connected to said medium voltage terminal and selectively operable to different positions for electrically connecting individual ones of the taps to the medium voltage terminal.



3,271,660

REFERENCE VOLTAGE SOURCE

David F. Hilbiber, Los Altos, Calif., assignor to Fairchild Camera and Instrument Corporation, Syosset, N.Y., a corporation of Delaware

Filed Mar. 28, 1963, Ser. No. 268,831
16 Claims. (Cl. 323—75)

14. A reference voltage generator comprising first and second NPN transistors, output terminals respectively connected to the bases of said transistors, one of said terminals connected to ground, first and second pluralities of semiconductor diode devices respectively connected in series with the emitters of said first and second transistors, means applying positive potential bias to the collectors of said transistors, first and second NPN transistors having their bases respectively connected to the collectors of said first and second NPN transistors, means applying negative potential bias to the collector said first PNP transistor, a breakdown diode having its positive terminal commonly connected to the emitters of said first and second PNP transistors, means applying positive potential bias to the negative terminal of said breakdown diode, a pair of feedback resistors series connected between the collector of said second PNP transistor and a source of negative potential bias, a third NPN transistor having its base connected to the collector of said first PNP transistor and its emitter connected to the base of said second NPN transistor, means applying positive potential bias to the collector of said third NPN transistor, a fourth NPN transistor having its emitter connected to the juncture between said feedback resistors and its collector commonly connected in series with said first and second pluralities of diode devices, a second breakdown diode having its negative terminal connected to the base of said fourth NPN transistor, means applying negative potential bias to the positive terminal of said second breakdown diode, and a resistor connected between the negative terminal of said second breakdown diode and ground, said first and second pluralities of diode devices respectively having total temperature coefficients at the levels of current flow therethrough which are equal and total potential drops thereacross which are unequal.

3,271,661

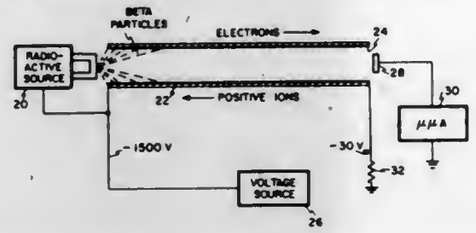
IONIZATION PRESSURE GAUGE WITH SECONDARY ELECTRON EMISSIVE RESISTIVE SURFACE AND MULTIPLYING CHANNEL MEANS

George W. Goodrich, Oak Park, James R. Ignatowski, Warren, and Robert R. Thompson, Livonia, Mich., assignors to The Bendix Corporation, Southfield, Mich., a corporation of Delaware

Filed Aug. 18, 1961, Ser. No. 132,333
2 Claims. (Cl. 324—33)

1. A pressure gauge comprising

an emitting source for emitting radiation capable of causing secondary electron emission on a secondary electron emissive surface with said radiation being emitted at a predetermined rate,



multiplying channel means for defining a multiplying path having an input end and an output end,

said multiplying channel means having an inner secondary emissive resistive surface disposed to receive at the input end said radiation and emit at the output end secondary electrons generated by said radiation,

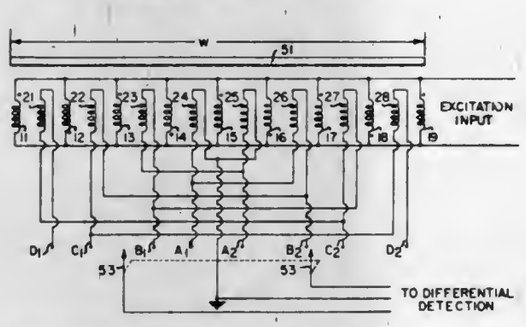
voltage means connected to said multiplying channel means for providing a voltage differential lengthwise of said multiplying channel means resistive surface so that a positive potential gradient exists from the input end to the output end along said secondary emissive resistive surface to accelerate electrons from the input end to the output end longitudinally of said channel means,

the channel means interior being subject to a medium the pressure of which is to be measured and said medium having molecules therein in proportion to the pressure of said medium,

said channel means having a substantially unobstructed acceleration path so that the positive ions formed by collision between the electrons and the molecules of

the medium can be accelerated to a more negative point on the secondary emissive resistive surface resulting in an impact with said inner secondary emissive surface resulting in secondary emission from said secondary emissive surface thereby providing electrons in proportion to the pressure in said medium,

collecting means disposed at the output end of said multiplying channel means and being at a sufficiently high potential to collect the electrons from said channel means,



indicating means connected to the collecting means for indicating the amount of the electrons collected by said collecting means which is in proportion to the pressure of the medium.

3,271,662

FLAW DETECTING APPARATUS HAVING MULTIPLE PICK-UP AND EXCITING COILS ON THE SAME SIDE OF THE TEST PIECE

George F. Quittner, Cleveland Heights, Ohio, assignor, by mesne assignments, to API Instruments Company, Chesterland, Ohio, a corporation of Ohio

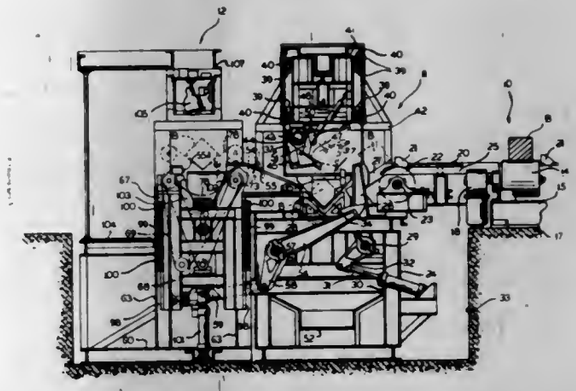
Filed Aug. 22, 1962, Ser. No. 218,783
2 Claims. (Cl. 324—37)

1. In apparatus for detecting a flaw in a sample material having thickness as its minor dimension and which is ferromagnetic or electrically conductive, the combination of

an alternating current source of power,

plural flux producing exciter coils equal in number to three plus a multiple of two, all of said exciter coils being arranged with their axes substantially perpendicular to said sample material while spaced across the width of said sample material and all being on one side of said sample material as regards the direction of its thickness dimension, said exciter coils being connected to said source so that said exciter coils are oppositely phased as regards their successive adjacency whereby to establish null flux planes between successive coils,

plural sensing coils equal in number to a multiple of two, all of said sensing coils being positioned to have their axes respectively substantially coincident with the respective null planes between sensing coils, while the sensing coils are located on the same side of said sample material in the direction of its thickness dimension as are said exciter coils,



means including a double-make, double-break multiposition selector switch and circuitry separately through separate portions of said switch and through a diminishing number of sensing coils arranged as equal halves of sensing coils in circuit and for comparing, by differencing, the signal of one of plural sensing coil circuits with that of another and analogous sensing coil circuit by switch selection of pairs of different, but equal as between pairs, numbers of sensing coils in circuit, each such circuit, except when the number of sensing coils included therein is unity, being characterized by having sensing coils thereof subtractively connected in series, for further differencing.

3,271,663

APPARATUS FOR INSPECTING BILLETS AND THE LIKE BY MEANS OF MAGNETIC PARTICLES

Richard S. Gewartowski and Joseph L. Deibel, Chicago, Ill., assignors, by mesne assignments, to Magnaflux Corporation, Chicago, Ill., a corporation of Delaware

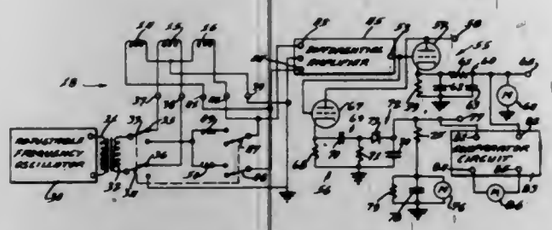
Filed Apr. 25, 1962, Ser. No. 190,103
6 Claims. (Cl. 324—38)

1. In apparatus for inspecting billets for flaws and imperfections as revealed by the orientation of magnetic particles on the surface of the billet;

means providing a magnetizing station including

means for receiving and cradling a billet,

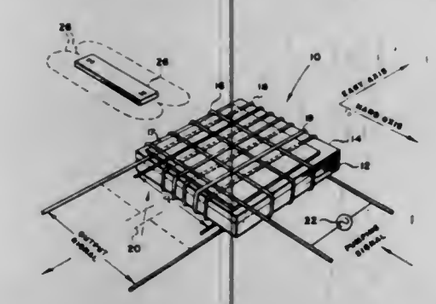
means for engaging and magnetizing the billet, and



means for applying magnetic particles to the billet;

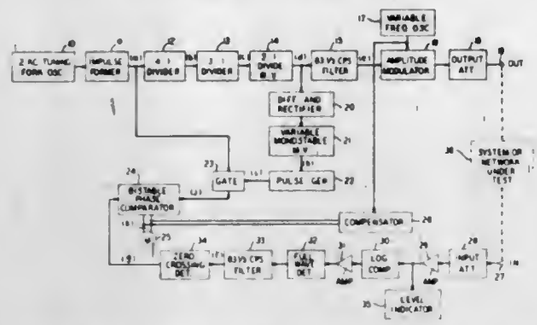
means for conveying and delivering a billet sidewardly to said magnetizing station and including ease-down means for receiving and depositing the billet in said receiving and cradling means for thereafter magnetizing and application of magnetic particles to the billet, said ease-down means including arms continually supporting in substantially non-sliding engagement said billet during the transfer of said billet to said cradling means;

means for transferring the treated billet from the magnetizing station;



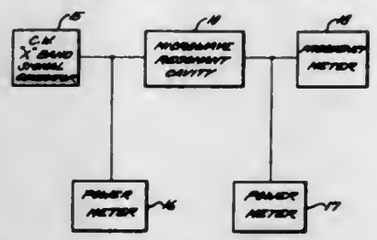
means providing an inspection station situated to receive the treated billet from said transferring means; and means for receiving the inspected billet from said inspection station.

3,271,664
COMBINED LEAKAGE FIELD AND EDDY CURRENT DETECTION SYSTEM
John M. Mountz, Niles, and John J. Flaherty, Elk Grove Village, Ill., assignors, by mesne assignments, to Magnaflux Corporation, Chicago, Ill., a corporation of Delaware
Filed Dec. 4, 1961, Ser. No. 156,680
8 Claims. (Cl. 324—40)



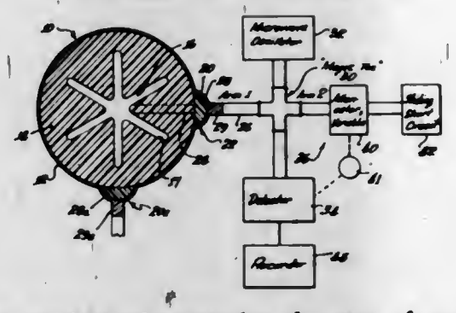
1. In a system for detecting either surface type defects or sub-surface type defects in a test piece of ferrous material having a permeability curve such that with an applied field increasing from zero toward a saturating value the absolute value of the first derivative of the permeability curve increases to a peak value at a first field strength value, then decreases to zero at a second field strength value, then increases to another peak value at a third field strength value and finally decreases to zero at a fourth relatively high saturating field strength value, test coil means disposed in proximity to a surface of said piece for inducing an A.C. field in said portion and inducing eddy currents therein and for developing a signal in response to said field and said eddy currents, and means for applying a unidirectional biasing field in said test piece having a value approximately equal to one of said second and third field strength values for producing a maximum change in said signal in response to one of said types of defects while producing a minimum change in said signal in response to the other of said types of defects.

3,271,665
THIN FILM FIELD SENSOR
Peter S. Castro and Frank F. Stucki, Palo Alto, Calif., assignors to Lockheed Aircraft Corporation, Burbank, Calif.
Filed Nov. 20, 1963, Ser. No. 324,993
6 Claims. (Cl. 324—43)



1. An improved flux sensing device for measuring the magnitude of external magnetic fields comprising: an insulative support member; a thin bistable magnetic film deposited on said support member, said film having easy and hard axes of magnetization perpendicular to one another and having square hysteresis loop characteristics along the easy axis; means including a first coil wound about said film and said support member for switching the magnetic vector of said thin magnetic film about said easy axis; and means including a second coil for detecting and recording the magnitude of an external magnetic field directed along the axis of said second coil and the hard axis of said thin magnetic film.

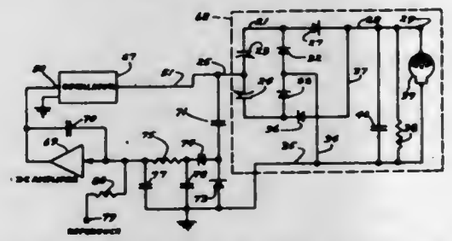
3,271,666
APPARATUS FOR MEASURING ENVELOPE DELAY DISTORTION WHEREIN SELECTED IMPULSES OF A HIGH FREQUENCY STANDARD ARE GATED TO ONE INPUT OF A BISTABLE PHASE COMPARATOR
Theodore C. Anderson, Morristown, and David L. Favin, Whippany, N.J., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Dec. 21, 1964, Ser. No. 419,864
23 Claims. (Cl. 324—57)



1. Apparatus for measuring the envelope delay distortion of a system comprising means for generating a train of accurately spaced voltage impulses, means responsive to said voltage impulses for producing a low frequency signal having a period which is an integral multiple of the voltage impulse spacing, means for generating variable frequency carrier signal, means for amplitude modulating said carrier signal by said low frequency signal, output means for coupling the resulting modulated signal to said system to be measured, input means for receiving the modulated signal from said system, means for demodulating the received modulated signal to provide a received low frequency signal, means for producing a second train of voltage impulses each of which occurs at a predetermined point in phase of said received low frequency signal, a bistable circuit means having two inputs one of which is connected to receive said second train of voltage impulses, gating means for coupling selected impulses from said first-mentioned generating means to the other input of said bistable circuit means, and means responsive to the duty cycle of said bistable circuit means for indicating the envelope delay of said system for each frequency of said variable frequency carrier signal.

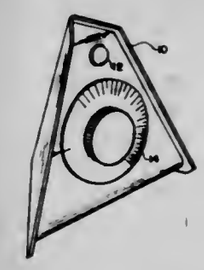
3,271,667
METHOD OF DETERMINING THE DIELECTRIC CONSTANT OF IRREGULARLY SHAPED CRYSTALS
Ernst R. Czerlinsky, Arlington, Mass., assignor to the United States of America as represented by the Secretary of the Air Force
Filed May 1, 1963, Ser. No. 277,403
6 Claims. (Cl. 324—58)

1. The method of determining at microwave frequencies the dielectric constant of a crystal such as a diamond comprising forming a first series of rods, each having a preselected dielectric constant, measuring the individual frequency shift resulting from the insertion of each of said rods in a microwave resonant cavity, embedding said crystal successively in a second series of rods identical in dielectric constant to said first series of rods, and measuring the frequency shift in said microwave resonant cavity resulting from the successive insertion of each of said second series of rods including said crystal into said microwave resonant cavity.



3,271,668
MICROWAVE MEASUREMENT OF SURFACE ATTRITION OF A DIELECTRIC BODY
Claus H. Haake, Altadena, Samuel T. Workman, Glendora, and Donald L. Johnson, West Covina, Calif., assignors to Giannini Controls Corporation, Duarte, Calif., a corporation of New York
Filed Aug. 23, 1962, Ser. No. 218,874
4 Claims. (Cl. 324—58.5)

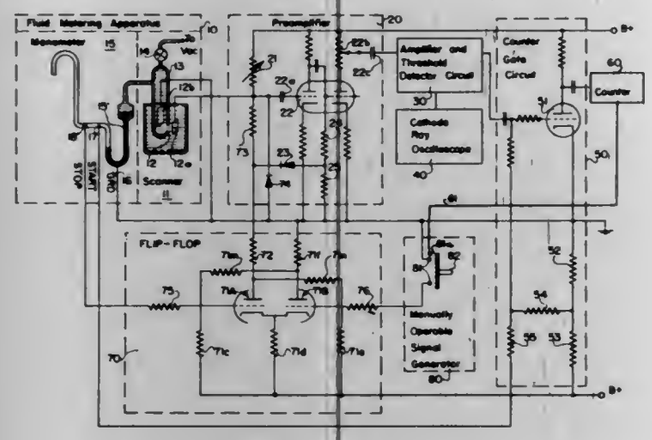
1. The method of measuring the rate of progressive attrition from a surface of a body of solid dielectric material, said method comprising
injecting electromagnetic radiation of microwave frequency into the body in a direction to be internally reflected from the said surface,
receiving radiation reflected from the surface,
and detecting the variations in the relative phase of the injected and reflected radiation that result from attrition at the surface.



3. A rocket testing system, comprising in combination structure forming a rocket combustion chamber having a wall portion of dielectric material,
a body of solid propellant within the chamber overlying the wall portion and having a free surface opposing the wall portion,
means for initiating combustion at said surface,
means for projecting an incident beam of electromagnetic radiation of microwave frequency through said wall portion into the body of propellant in a direction to be internally reflected from said surface,
and means for comparing the phase of the incident and reflected radiation to detect attrition of said surface during combustion of the propellant.

3,271,669
ALTERNATING CURRENT DIODE LOOP CAPACITANCE MEASUREMENT CIRCUITS
Tenny Lode, Mankato, Minn., assignor to Rosemount Engineering Company, Minneapolis, Minn., a corporation of Minnesota
Filed Dec. 4, 1962, Ser. No. 242,166
22 Claims. (Cl. 324—60)

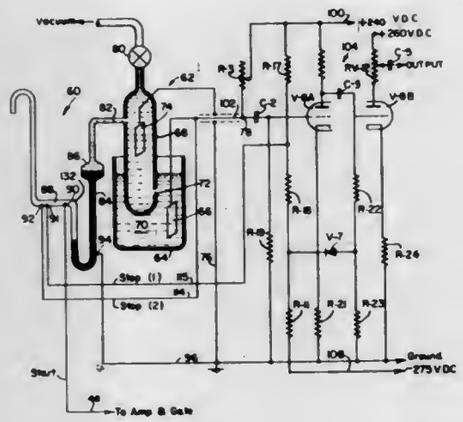
1. Capacitor comparator circuitry comprising first network including first and second capacitors which are variable relative to each other, said first capacitor being connected for conduction between a first input terminal and a first junction and said second capacitor being connected for conduction between said first input terminal and a third junction, first, second, third and fourth diodes all connected for conduction in the same direction in a closed series loop with a second input terminal on said loop between the first and second diodes, said first junction being on said loop between the second and third diodes, a second junction on said loop between the third and fourth diodes and said third junction being on said loop between the fourth and first diodes, a base load connected between said second input terminal and second junction, alternating voltage supply means having output and base potential terminals for supplying power to said first and second input terminals comprising an oscillator having a signal input, output and base potential terminals, said output being amplitude-controlled by a unidirectional voltage input signal, an amplifier having an input summing point and a unidirectional voltage output coupled to the osciliator signal input for supplying signal input thereto, at least one network energized by the oscillator output, said network comprising a capacitor, having first and second terminals, said first terminal being energized by the oscillator output, said capacitor being of a size such that it is subtsantially fully recharged by each cycle of alternating current imposed thereon, current carrying means coupled to said capacitor second terminal for conduction of capacitor charge and discharge cycles to said base potential and summing point, respectively, and a unidirectional voltage reference connected for conduction to said summing point, whereby said alternating voltage supply means output amplitude is controlled by a summation of currents from said reference and network currents.



3,271,670
ELECTRONIC BEAT PRODUCING DEVICE
Daniel A. Esakov, West Hartford, and William J. Hildebrandt, Weatogue, Conn., assignors to Connecticut Technical Corporation, Hartford, Conn., a corporation of Connecticut
Filed Apr. 2, 1962, Ser. No. 184,366
6 Claims. (Cl. 324—68)

1. An electronic metronome comprising a transistor having emitter, base and collector terminals, means providing a source of direct current voltage, a transformer having a primary coil connected between said collector terminal and one side of said voltage source and also having a secondary coil connected between said base terminal and the other side of said voltage source, said primary and secondary coils being so arranged as to provide at least part of a regenerative feedback path between said collector and base terminals which causes oscillations in the current flowing through said collector terminal, a resistance and a capacitance connected in parallel between said emitter terminal and said other side of said voltage source for alternately quenching and permitting said oscillations of said collector current so as to produce successive burts of such oscillations, said transformer including an iron core having an armature movable in response to flux changes produced by energization of said transformer

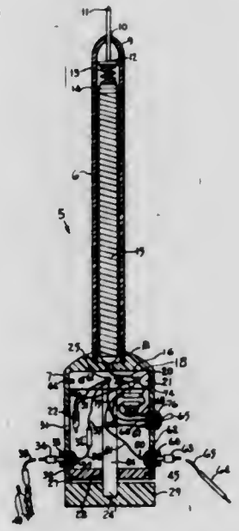
by said bursts of oscillations, and a sounding device connected to said armature for converting the movement of said armature into audible sounds.



3,271,671
PARTICLE ANALYZING DEVICE
Wallace H. Coulter, Miami Springs, Fla., assignor to Coulter Electronics, Inc., Chicago, Ill.
Original application Apr. 6, 1961, Ser. No. 101,289. Divided and this application Aug. 16, 1965, Ser. No. 479,907
20 Claims. (Cl. 324—71)

1. A particle analyzer, for studying particles suspended in a fluid, comprising:
(a) fluid suspended particle scanning means for generating electric scanner signals, each signal having a parameter which is a function of a physical property of a respective scanned particle, incorporating
(i) a pair of scanner electrodes,
(ii) means for metering the volume of fluid scanned during the period of an analytic run,
(iii) means for generating a start signal at the beginning of an analytic run, and
(iv) means for generating a stop signal at the end of an analytic run;
(b) means for analyzing the scanner signals;
(c) manually operable signal generating means;
(d) means for energizing the scanner electrodes in response to a signal received from the manually operable signal generating means and for de-energizing the scanner electrodes in response to a stop signal received from the stop signal generating means; and
(e) means for activating the analyzing means in response to a signal received from the start signal generating means
whereby the generation of a start signal causes activation of the analyzing means and the generation of a stop signal causes de-energization of the scanner electrodes so that the scanner electrodes are energized only before and during the period of an analytic run when a metered volume of fluid is being scanned.

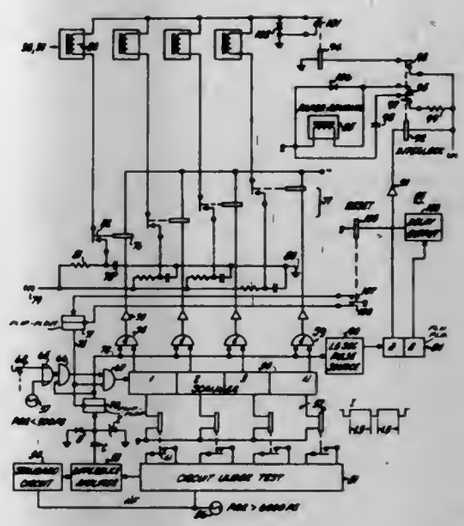
3,271,672
PARTICLE STUDYING DEVICE CONTROL CIRCUIT
Michael I. Henderson, London, England, assignor to Coulter Electronics, Inc., Chicago, Ill.
Continuation of application Ser. No. 139,516, Sept. 20, 1961. This application Oct. 4, 1965, Ser. No. 492,732
21 Claims. (Cl. 324—71)



1. A particle analyzer, for studying particles suspended in a fluid, comprising:
(a) fluid suspended particle scanning means, having a pair of scanner electrodes, for generating scanning signals, each signal having a parameter which is a function of a physical property of a respective scanned particle;
(b) means for analyzing the scanning signals;
(c) liquid manometer means for metering the volume of fluid scanned, having a metering section;
(d) means for sensing the passage of the manometer liquid past a first point in the metering section and for generating a first program signal;
(e) means for sensing the passage of the manometer liquid past a second point in the metering section and for generating a second program signal;
(f) means for sensing the passage of the manometer liquid past a third point in the metering section and for generating a third program signal;

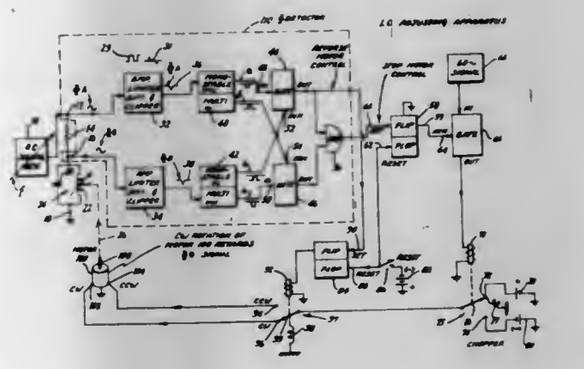
(g) means for activating the analyzing means in response to the receipt of the first program signal;
(h) means for de-activating the analyzing means in response to the receipt of the second program signal; and
(i) means for de-energizing the scanning means in response to the receipt of the third program signal;
the first point being separated from the other points by a distance which is a function of the volume of fluid scanned during the period of an analytic run, whereby the analyzing means are activated only during the period of an analytic run and the scanning means are de-energized after an analytic run.

3,271,673
HIGH VOLTAGE TELEVISION TEST PROBE HAVING AN ADJUSTABLE FREQUENCY BLINKER INDICATOR
Joseph Woroble, Kearny, N.J.
(55 Morgan Place, North Arlington, N.J. 07032)
Filed Jan. 12, 1966, Ser. No. 520,281
4 Claims. (Cl. 324—72.5)



1. A television high voltage testing probe, comprising, in combination,
a narrow elongated insulating tube tapered at one end and terminating with a small opening,
an enlarged hollow insulating housing connected to the other end of said tube and having a window and an index near its open end,
a conductive pointed contact rod disposed within the end of said tube and projecting through the small opening thereof,
a multi-megohm fixed resistance cartridge having an end lead and disposed within said tube and connected at its other end in conducting relation with said rod,
an insulating retainer wall disposed in said enlarged housing adjacent said cartridge end lead and having access therethrough for said cartridge lead,
a variable resistor having a fixed connection, an open end connection, and a variable resistance connection, and a rotatable resistance-varying shaft projecting axially out of said housing and mounted in said housing behind said retainer wall and connected to said cartridge lead at its fixed connection,
a jack receptacle mounted in the wall of said housing and having an internal jack connection,
a fixed fuse resistor connected in series with said jack connection and the variable resistance connection of the variable resistor,
a knob attached to the projecting shaft end of said variable resistor and calibrated to indicate, in conjunction with the index on the housing, the high voltage at the contact rod,

a ground clamp adapted to be plugged into said jack receptacle,
a neon lamp disposed in said housing adjacent said window and having terminals connected across the fixed connection and the variable resistance connection of said variable resistor and designed to light up when the voltage indicated on the knob is near or at the voltage at the contact rod, and
a capacitor connected across the lamp terminals and designed and mounted in a manner so as to cause said neon lamp to blink when said indicated voltage is reached.



3,271,674
CIRCUIT VARIANCE ANALYZER INCLUDING SCANNER CONTROLLED PARAMETER VARIATION OF THE TEST CIRCUIT
Kenneth R. Horning, Chicago, and John Massey, La Grange Park, Ill., assignors to International Telephone and Telegraph Corporation, New York, N.Y., a corporation of Maryland
Filed Apr. 28, 1961, Ser. No. 106,326
8 Claims. (Cl. 324—73)

1. A circuit variance analyzer for detecting variations in the output of a circuit under test, comprising a standard circuit having output characteristics corresponding to the desired output characteristics of said circuit under test, scanning means driven at a relatively low rate for providing predictable combinations of scanning outputs, selecting means operated responsive to said combinations of outputs of said scanning means for selecting successive combinations of control circuitry, said control circuitry operated to vary the parameters of said circuit under test, means driven at a relatively high rate for simultaneously, repeatedly energizing the input of said standard circuit and said circuit under test to cause said circuits to produce outputs, comparator means operated responsive to

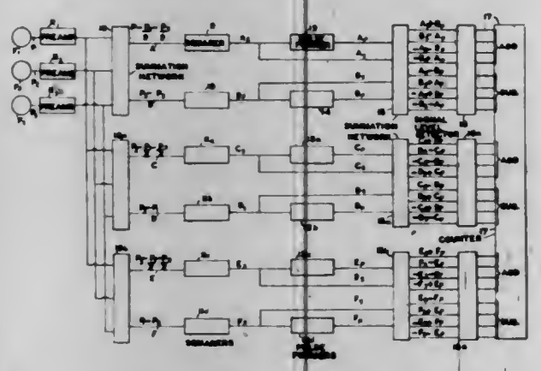
differences in the outputs of said standard circuit and said circuit under test for providing command signals, printout means operated responsive to said command signals and said scanning outputs for visually indicating said differences on a recording medium.

3,271,675
PHASE DETECTOR AND AUTOMATIC APPARATUS UTILIZING SAID PHASE DETECTOR FOR PERFORMING A ROTATIONAL MECHANICAL ADJUSTMENT TO EFFECT A PHASE COINCIDENCE
Earl R. Kreinberg, Harrisburg, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Delaware
Filed Dec. 13, 1962, Ser. No. 244,416
13 Claims. (Cl. 324—83)

1. A phase coincidence detector for (1) providing an output signal at one lead when two periodic input signals attain phase coincidence, and (2) providing an output signal at another lead when the phase of a predetermined one of said input signals leads the other, comprising:
(a) means for deriving respective pulse trains from said input signals, said pulse trains having the same relative phases as said input signals,
(b) two pulse lengtheners coupled to said means of clause (a) for deriving lengthened pulses from said pulse trains,

(c) means, responsive to said lengthened pulses, and having two output leads, for providing simultaneous pulses on said two output leads when said lengthened pulses are in phase coincidence, and for providing pulses on a predetermined one only of said output leads when said predetermined one of said input signals leads the other, and

(d) an AND gate having two inputs connected to said two output leads whereby said AND gate will provide an output only when said input signals are in phase coincidence.



3,271,676

THREE DETECTOR CYCLE COUNTING MEANS

Anwar K. Chitayat, Plainview, N.Y., assignor to Optomechanisms, Inc., Plainview, N.Y.

Original application Jan. 23, 1963, Ser. No. 253,473. Divided and this application Jan. 25, 1963, Ser. No. 254,015

3 Claims. (Cl. 324—83)

3. In a cycle counting means comprising,

means to provide a phase reference signal,

means to measure phase shift of said adjustable phase signal with respect to said reference signal by counting fractional wavelengths comprising,

means connected to receive said adjustable phase signal and to produce first, second and third signals from said adjustable phase signal, said first, second, and third signals being 120° apart in phase,

means connected to said last means to combine said first, second, and third signals with said phase reference signal to provide first, second and third combined signals,

means connected to said last means to detect said first, second and third combined signals and provide detected signals,

first summation network means connected to said last means to combine said detected signals to provide a plurality of pairs of sine wave signals separated by 90° in phase, each of said pair of signals being separated by 120°,

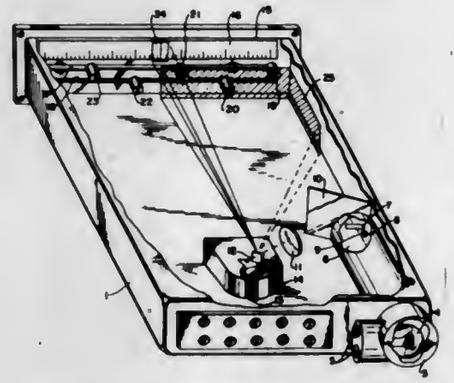
means connected to said last means to make square waves of said pairs of signals,

means connected to said last means to provide pulses from said pairs of signals,

second summation network means connected to said square wave and pulse means to combine said square wave signals and said pulses to provide plus signals when said adjustable phase signal moves in one direction with respect to said phase reference signal and to provide minus signals when said adjustable phase signal moves in the opposite direction, and

plus-minus counter means connected to said last means to count said pulse signals thereby counting fractional cycles of phase shift.

3,271,677



METER MOVEMENT WITH SCALE RANGE INDICATORS ACTUATED BY PHOTORESPONSIVE SWITCHING CIRCUITS

Helmut Peter, 7 Elbestrasse, Erlangen, Germany, and Gotthilf Schrenk, deceased, late of Erlangen, Germany, by Maria-Luise Schrenk geb. Albrecht, executor, 3 Langemarckplatz, Erlangen, Germany, and Hartmut Schrenk, 7 Steinickeweg, Munich 13, Germany; Martin Schrenk, 3 Langemarckplatz, Erlangen, Germany; Monika Schrenk, 30 Dustere Eichen-Weg, Gottingen, Germany; and Friedrich Schrenk and Renate Schrenk, 3 Langemarckplatz, Erlangen, Germany, heirs

Filed June 25, 1965, Ser. No. 467,829

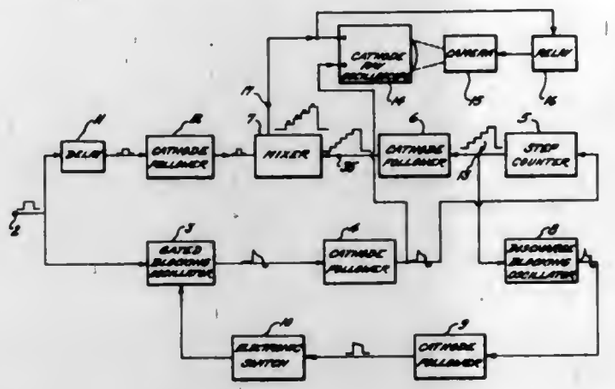
Claims priority, application Germany, Oct. 28, 1959, G 28,251; Nov. 12, 1959, G 28,352

3 Claims. (Cl. 324—96)

1. A photo-responsive switching device for use with a meter movement whose angular displacement is proportional to a variable quantity and indicative of said quantity on an associated scale, comprising a plurality of photo-responsive elements adapted to conduct current therethrough upon illumination by light moveably secured along a path adjacent said scale, the spacing between adjacent elements corresponding to a predetermined range of said scale, means mounted on said meter movement for transmitting an elongated visible beam adapted to travel along said path containing said elements and a marking beam onto said scale, a characteristic line of said marking beam corresponding to the quantity to be measured and travelling in unison with a front edge of said elongated beam, whereby rotation of said meter movement causes said elongated beam to progressively illuminate each of said elements, switching means comprising a normally open and a normally closed switch means serially connected to each of said elements and a source of current for energization upon illumination of said elements by said elongated beam, the arrangement being such that a normally open switch means associated with one element is connected to a normally closed switch means of an adjacent element, and an indicating output means for each of said ranges is connected to said current source through said interconnected normally open and normally closed switch means of the respective adjacent elements, whereby only the indicating output means associated with a range on which said characteristic line of said marking beam is located, is energized.

3,271,678

ELECTRONIC SIGNAL ANALYZER FOR A SERIES OF SUCCESSIVE PULSES



Paul J. Daly, Quincy, and Joseph F. Clark, Lexington, Mass., assignors to the United States of America as represented by the Secretary of the Air Force

Filed Feb. 27, 1962, Ser. No. 176,159

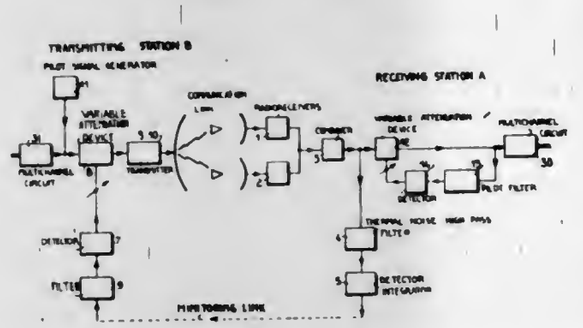
2 Claims. (Cl. 324—121)

1. An electronic signal analyzer, in combination with a cathode ray oscilloscope and a camera, comprising means to generate a successively stepped signal from a series

of pulses, each step being representative of a single pulse of said series, means to trigger the sweep of said cathode ray oscilloscope with each pulse of said series of pulses, means to switch off said triggering means, said switching means being controlled by the last step of said stepped

signal, means to delay each pulse of said series of pulses, means to superimpose each of said delay pulses upon the step of said stepped signal representative thereof, and means to display said superimposed signal on said cathode ray oscilloscope.

3,271,679



FREQUENCY MODULATION COMMUNICATION SYSTEM HAVING AUTOMATIC FREQUENCY DERIVATION CONTROL IN RESPONSE TO RECEIVED THERMAL NOISE

Boris Fostoff, Maisons-Laffitte, France, assignor to Compagnie Francaise Thomson-Houston, Paris, France, a French body corporate

Filed Feb. 4, 1963, Ser. No. 255,993

Claims priority, application France, Feb. 6, 1962, 887,070, Patent 1,322,204

9 Claims. (Cl. 325—31)

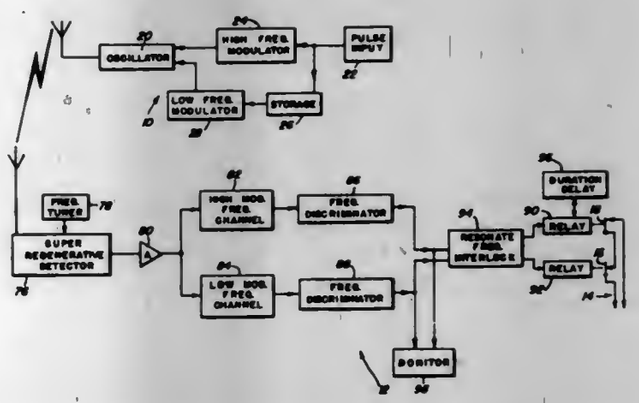
1. In a frequency-modulation system including a transmitter and a receiver, said transmitter having frequency-modulation means for producing a frequency-modulated intelligence-bearing signal and means for transmitting said signal, the provision of a monitoring arrangement for at all times maximizing the signal-to-noise ratio at the receiver comprising:

a high-pass thermal noise filter connected to the receiver for selectively deriving a signal corresponding to a thermal noise component accompanying the received intelligence-bearing signal as an indication of the strength of said latter;

integrator means connected to the output of the filter means for deriving from said thermal noise signal a monitoring signal corresponding to averaged thermal noise;

variable means connected to said frequency-modulation means for modifying the frequency-deviation of said intelligence-bearing signal; and

means connected for varying said variable means in accordance with variations in said monitoring signal whereby to maintain said frequency-deviation substantially at its optimal value corresponding to minimum noise-to-signal ratio at the receiver.



3,271,680

DUAL MODULATED REMOTE CONTROL SYSTEM

Willard S. Reynolds, Hollywood, Fla., assignor to Telectron Company, Division of Elliott & Evans, Inc., Fort Lauderdale, Fla., a corporation of Ohio

Filed Dec. 31, 1963, Ser. No. 334,791

14 Claims. (Cl. 325—37)

1. A private communication system comprising, a transmitter having means for radiating signal energy at a predetermined carrier frequency and modulating means for sequentially modulating said signal energy at lower and higher modulating frequencies, a receiver having means for detecting said lower and higher modulating frequencies when tuned to said predetermined carrier frequency, separate channel means coupled to said detecting means for respectively conducting signal energy at the lower and higher modulating frequencies, a utilization circuit having relay means respectively energized by modulated signal energy at said lower and higher modulating frequencies to complete the circuit, interlock means coupled to said separate channel means for preventing energization of the relay means in response to signal energy simultaneously conducted through the channel means at said lower and higher modulating frequencies, and delay means responsive to energization of the relay means by signal energy at one of said modulating frequencies for prolonging energization thereof to overlap reception of modulated signal energy at the other modulating frequency.

3,271,681

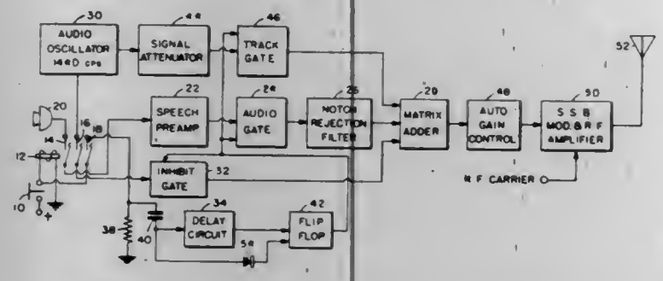
AUTOMATIC SYSTEM FOR CORRECTING FOR DOPPLER SHIFT IN SINGLE SIDEBAND COMMUNICATIONS EQUIPMENT

Robert J. McNair, Cincinnati, Ohio, assignor to Avco Corporation, Cincinnati, Ohio, a corporation of Delaware

Filed Feb. 3, 1964, Ser. No. 342,085

15 Claims. (Cl. 325—65)

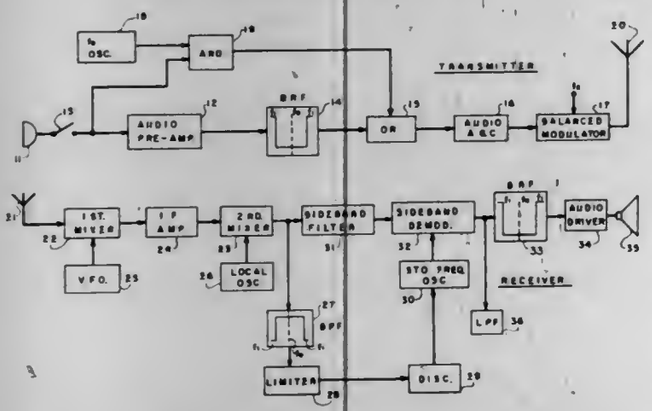
10. In a transmitter-receiver communications system, the combination comprising:



a source of intelligence signal in a given frequency spectrum;

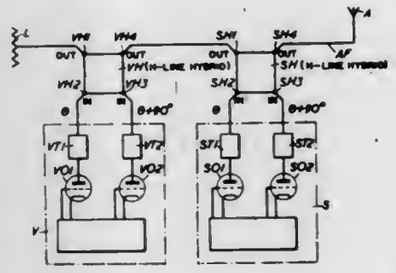
a first source of reference signal within said spectrum;

means for initially transmitting said reference signal to a remote receiver;



means after a predetermined delay period for inhibiting the transmission of said reference signal and for transmitting said intelligence signal;

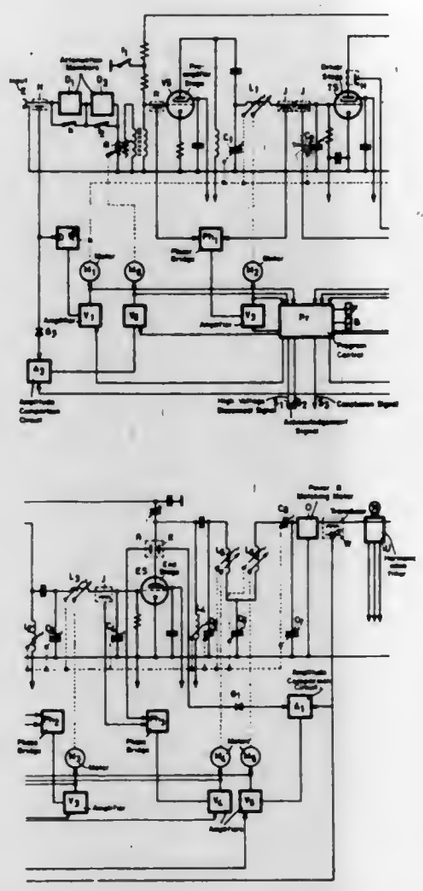
a second source of reference signal having a frequency adjacent said spectrum;
means responsive to the power level of said intelligence signal for transmitting said second reference signal when the power level of said intelligence signal is below a predetermined level;
means at said receiver for detecting each of said first and second reference signals and said intelligence signals;



means responsive to a difference in frequency between said detected first reference signal and said transmitted first reference signal for controlling the frequency of operation of said receiver during said delay period;
means responsive to a difference in frequency between said detected second reference signal and said transmitted second reference signal for controlling the frequency of operation of said receiver after said delay period; and
a transducer driven by said detected intelligence signal.

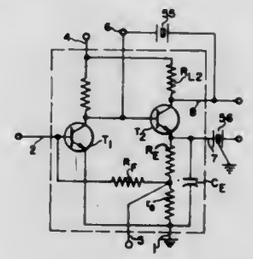
3,271,682
DOPPLER-SHIFT CORRECTOR FOR SINGLE SIDEBAND COMMUNICATIONS SYSTEMS
Charles A. Bucher, Jr., Cincinnati, Ohio, assignor to Avco Corporation, Cincinnati, Ohio, a corporation of Delaware
Filed Feb. 3, 1964, Ser. No. 342,170
5 Claims. (Cl. 325—65)

1. In a transmitter-receiver communications system, the combination comprising:
a source of signal intelligence having a given frequency spectrum;
means for rejecting a single redundant portion of the frequency spectrum of said signal intelligence;
a single source of reference signal having a frequency substantially at the center of the rejected single redundant portion of said frequency spectrum;
a carrier;
means for modulating said carrier with said reference signal and the non-rejected frequency spectrum of said signal intelligence;
means for transmitting at least one sideband of said modulated carrier;
a receiver for receiving said transmitted sideband, said receiver including demodulator means for demodulating said transmitted sideband, said demodulator means including a controllable oscillator;
means for detecting said reference signal;
reference frequency comparison means pre-established at said receiver, said reference frequency comparison means having an operating frequency which is the same as the frequency of said source of reference signal at the transmitter;
means for developing a control signal responsive to the difference in frequency between said detected reference signal and the operating frequency of said reference comparison means; and
means responsive to said control signal for controlling the frequency of operation of said oscillator.



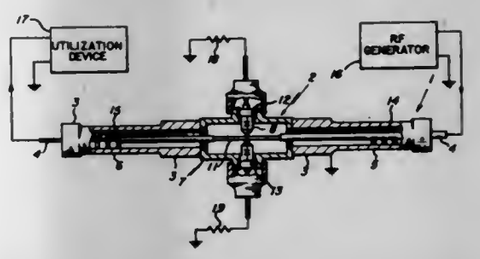
3,271,683
PLURAL HYBRID LOAD COUPLING ARRANGEMENT FOR PLURAL TRANSMITTERS WITH OUTPUTS IN PHASE QUADRATURE
Boleslaw Marian Sosin, Great Baddow, England, assignor to The Marconi's Company Limited, a British company
Filed July 12, 1963, Ser. No. 294,663
Claims priority, application Great Britain, July 17, 1962, 27,331/62
4 Claims. (Cl. 325—130)

1. A circuit for coupling a plurality of transmitters of different frequencies to a common load, said circuit comprising a plurality of four-port hybrids each having two pairs of ports, one pair of ports of each hybrid being coupled in cascade between said common load and a balancing load and each hybrid having one of said ports connected to a corresponding port of the next hybrid in the cascade sequence, and a plurality of transmitters each having two output terminals on which appear output signals in phase quadrature relation with respect to one another, said output signals being fed into the two remaining ports of a corresponding hybrid through circuits tuned to the corresponding output signal frequency, the means coupling said output terminals to said two remaining ports being so chosen in relation to one another that the signals fed in at said two remaining ports combine additively at the port leading to the common load.



3,271,684
METHOD OF AUTOMATICALLY ADJUSTING A BROADCAST TRANSMITTER
Adolf Simon, Berlin-Steglitz, Germany, assignor to Siemens & Halske Aktiengesellschaft Berlin and Munich, a corporation of Germany
Filed Aug. 6, 1962, Ser. No. 215,062
Claims priority, application Germany, Aug. 30, 1961, S 75,507
12 Claims. (Cl. 325—175)

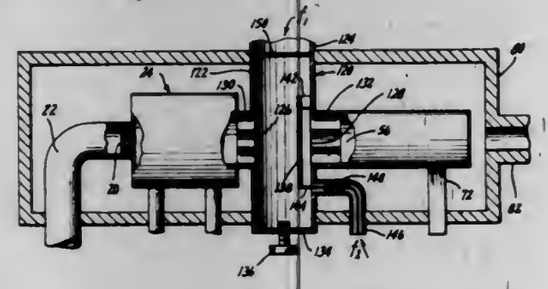
1. A method for automatically adjusting a broadcast transmitted, with transmitter stages having tuned oscillation circuits, and including an end stage, to a control frequency supplied thereto from a central station or the like, which control frequency has a value maintained constant during the tuning adjustment, comprising the steps of adjusting tuning elements of the transmitter stages to a coarse range in dependence upon the frequency of said supplied control frequency, tuning the oscillation circuits in the transmitter stages, by resonance tuning, to the control frequency, adjusting the coupling of the end



stage by impedance matching to its working impedance, adjusting the total amplification of the transmitter to the desired output power, and transmitting to the central station a signal for effecting holding of the supplied control frequency value to the conclusion of the tuning.

3,271,685
MULTIPURPOSE MOLECULAR ELECTRONIC SEMICONDUCTOR DEVICE FOR PERFORMING AMPLIFIER AND OSCILLATOR-MIXER FUNCTIONS INCLUDING DEGENERATIVE FEEDBACK MEANS
John D. Husher, Greensburg, and James E. McClain, North Belle Vernon, Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed June 20, 1963, Ser. No. 289,216

1. Electronic apparatus for providing any one of a plurality of circuit functions including that of an oscillator-mixer comprising: a unitary body of semiconductive material with a plurality of N and P type semiconductive regions therein providing a first transistor functional portion including emitter, base and collector regions, a second transistor functional portion including emitter, base and collector regions distinct from said emitter, base and collector regions of said first transistor functional portion, a capacitance functional portion, and a plurality of resistance functional portions conductively interconnected to various regions of said first and second transistor functional portions including a first resistance functional portion connected to the collector of said first transistor functional portion and a second resistance portion connected to the collector of said second transistor functional portion for the purpose of biasing said transistor functional portions upon application of a suitable supply potential at the extremity of said resistance portions and a degenerative feedback loop comprising at least one of said resistance functional portions interconnected between the emitter of said second transistor functional portion and the base of said first transistor functional portion; a direct conductive interconnection between the collector of said first transistor functional portion and the base of said second transistor functional portion so that said device is capable of signal amplification with a gain at least comparable to that achieved if only said first transistor functional portion is utilized while using a bias resistance connected to the collector of said first transistor functional portion which is less than about 3000 ohms; said capacitance functional portion being connected across the emitter of said second transistor functional portion and a point of common reference potential; frequency stabilizing means connected to said unitary body between two circuit points each effectively associated with one of said regions of said transistor functional portions to provide an oscillatory signal at a first frequency; means to supply a modulated carrier wave at a second frequency to the base of said first transistor functional portion means to derive an output signal at the beat frequency of said first and second frequencies from the emitter of said second transistor functional portion.



3,271,686
SIGNAL MIXERS
Marvin J. Bock, Santa Barbara, Calif., assignor to Raytheon Company, Lexington, Mass., a corporation of Delaware
Filed Oct. 8, 1962, Ser. No. 229,047
5 Claims. (Cl. 325—445)

1. An electrical device comprising in combination, an elongated waveguide, a three-element transmission line comprising first and second coaxial conducting elements including center and outer conductors with said outer conductors mounted upon and extending outwardly from opposite sides of the waveguide, and a third element extending through the interior of the waveguide with its opposed ends connected respectively to the center conductors of said first and second elements, said first element comprising means for transmitting a first signal to the third element, the waveguide comprising means for transmitting a second signal to said third element, and mixing means at said third element for mixing said first and second

signals, producing a resultant third signal, and coupling said third signal to only said second element of the three-element transmission line.

3,271,687
FREQUENCY CONVERTER EMPLOYING MOLECULAR CONVERSION MEDIUM
William E. Bradley, Washington, D.C., assignor, by mesne assignments, to Philco Corporation, Philadelphia, Pa., a corporation of Delaware
Filed May 15, 1961, Ser. No. 110,199
10 Claims. (Cl. 325—448)

2. A frequency converter employing a molecular conversion medium for heterodyning first and second oscillatory signals, the frequency of at least one of said signals being other than a characteristic transition frequency of said molecular conversion medium, the sum or difference of the frequencies of said two oscillatory signals being equal to a characteristic transition frequency of said molecular conversion medium, said frequency converter comprising a source of said molecular conversion medium, first means cooperating with said molecular conversion medium supplied by said source for creating an excess of molecules in the upper one of a pair of coupled inversion states, second means responsive to applied signals for subjecting said upper state molecules to an electromagnetic perturbation field, said field having components at frequencies equal to the frequency of each of the signals supplied to said second means, third means separate from said second means for extracting energy from said conversion medium in response to transitions of said upper state molecules to the lower of said two coupled states and means for supplying said first and second signals to be heterodyned to said second means.

3,271,688
FREQUENCY AND PHASE CONTROLLED SYNCHRONIZATION CIRCUIT
Hans W. Gschwind and Rudolf H. Huebel, Alamogordo, N. Mex., assignors to the United States of America as represented by the Secretary of the Air Force
Filed Apr. 17, 1963, Ser. No. 273,795
1 Claim. (Cl. 328—55)

A circuit arrangement for achieving bit synchronization from a pulse code modulated input signal comprising:

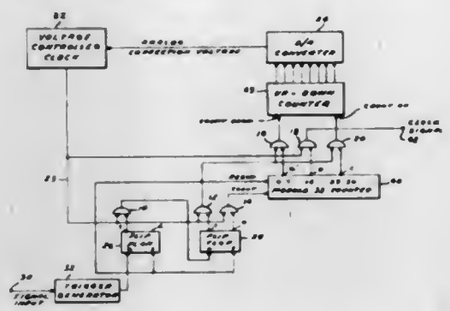
a trigger generator receiving said input signal and producing a trigger pulse for each change in level of said input signal,

first and second flip-flop circuits,

a clock pulse generator of variable frequency,

first, second and third AND gates each having one input from said generator,

said first flip-flop having one input terminal receiving said trigger pulse and a second input terminal connected to a corresponding input terminal of said second flip-flop and the output of said second AND gate, said first flip-flop being switched to its alternate state each time said trigger pulse is applied thereto,



said first and second AND gates having a second input from corresponding output terminals of said first and second flip-flops, respectively,

said third AND gate having a second input from the output terminal of said second flip-flop,

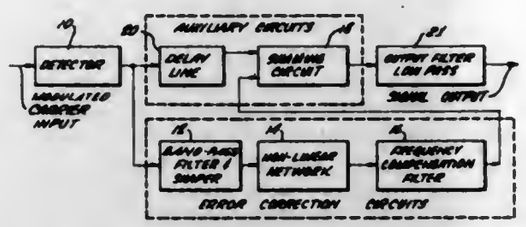
connecting means between the output of said first AND gate and the other input terminal of said second flip-flop,

counting means for advancing in unit steps from a zero reference through an ordered sequence of distinguishable circuit output states and being reset automatically to zero reference each time the maximum count is registered,

said counting means having one input terminal receiving the output of said third AND gate for causing the count to advance and a second input terminal receiving the output of said second AND gate for clearing said counter to zero reference, said counter being cleared to zero by the second clock signal which occurs following the setting of said first flip-flop to said alternate state whereby phase synchronization of said clock pulses and each of said level-changing signals is established within an interval which is no greater than the duration of two successive clock pulse periods,

said counting means including first, second, and third output terminals for sequentially registering counts in the lower, medium, and higher regions of the count interval each time the count interval is traversed,

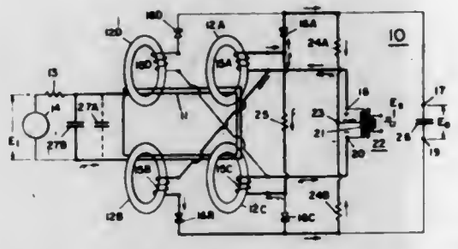
fourth, fifth and sixth AND gates,



said fourth and sixth AND gates each having an input connected to the output of said second gate and a second input, respectively, from the first and third output terminals of said counter,

digital signal producing means receiving the outputs of said fourth and sixth AND gates for producing a decreasing digital signal when said fourth AND gate is open and an increasing digital signal when said sixth AND gate is open,

and conversion means receiving said digital signal for producing an analog correction signal which accelerates or delays the oscillations of said clock pulse generator in accordance with said correction signal whereby bit synchronization between said input signal and the output bit rate of said fifth AND gate is achieved.

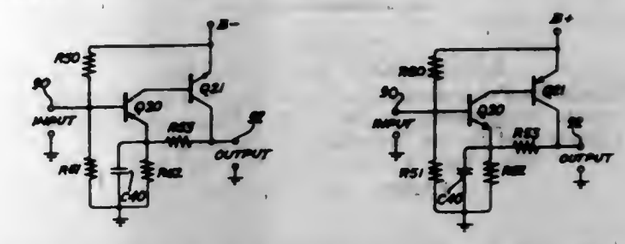


3,271,689
DEMODULATOR FOR TIME MODULATED SIGNALS
Wayne K. Hodder, Glendora, Calif., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Filed Jan. 6, 1964, Ser. No. 335,727
4 Claims. (Cl. 329—136)

1. A demodulator circuit for demodulating a carrier signal which is time modulated by an information signal, the demodulator including a detector for generating an output signal having frequency components corresponding to the information signal and unwanted side bands, a band-pass filter for passing signals on either side of the carrier frequency, the output of the detector being connected to the filter, a square-law network coupled to the output of the band-pass filter, a low-pass filter for pass-

ing only signals within the frequency range of the information signal, and means for combining the output of the square-law network with the output from the detector and applying the combined outputs to the low-pass filter.

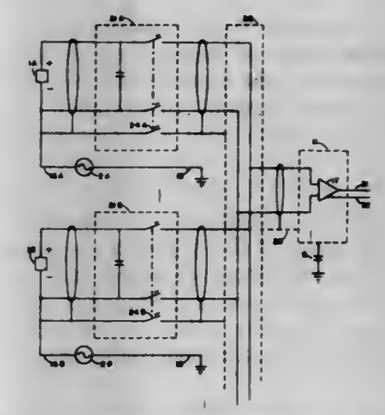
3,271,690
PUSH-PULL FULL-WAVE MAGNETIC AMPLIFIER
James L. Cockrell, Ann Arbor, Mich., assignor to Leeds and Northrup Company, Philadelphia, Pa., a corporation of Pennsylvania
Filed Feb. 13, 1963, Ser. No. 258,267
5 Claims. (Cl. 330—8)



1. A push-pull full-wave magnetic amplifier including two pairs of saturable cores each having an output winding and a source of switching pulses of alternately opposite polarity characterized in that the cores of each pair are inductively coupled in push-pull relation by an input-signal winding common to all cores, and that a coupling resistance means is connected between the output windings of one of the cores of each of said pairs to provide a series-circuit across said source for alternate resetting of said one core of each of the two pairs by current from said source, the other core of each of the two pairs being reset by current induced in said input-signal winding common to all cores in consequence of the current-flow through said series-circuit from said source.

ERRATUM

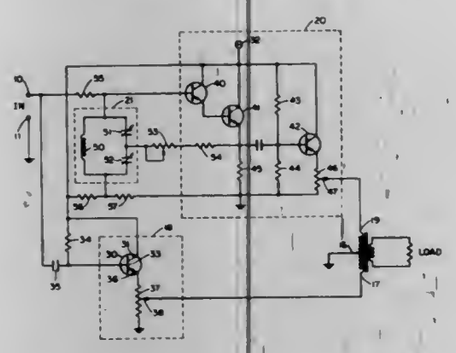
For Class 330—4.7 see:
Patent No. 3,271,731



3,271,691
RADIATION MONITOR CIRCUIT INCLUDING AMPLIFIER
Harry H. Hendon, Campbell, and Louis D. Test, Santa Clara, Calif., assignors to General Electric Company, a corporation of New York
Filed May 8, 1961, Ser. No. 108,652
11 Claims. (Cl. 330—17)

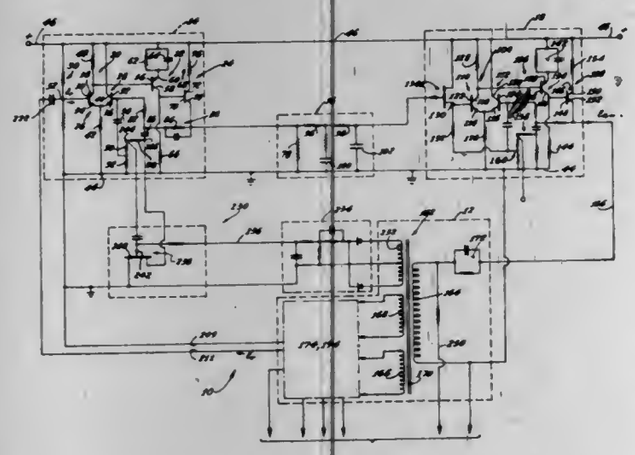
1. A doublet transistor amplifier which comprises a first and a second transistor stage having transistors of opposite polarity and each connected in a common emitter configuration, the collector of said first stage being directly connected without any intervening impedance elements to the base of the second stage and having terminals connecting said doublet amplifier to a source of operating potential, a first resistance connected between said terminals, a signal input terminal connected to an intermediate point on said first resistance and to the base of said first stage, a signal output terminal connected to the collector of said

second stage, a second resistance connecting the collector of the second stage to the emitter of the first stage, and means consisting of third resistance and a capacitance in parallel connecting the emitter of the first stage to the common potential terminal.



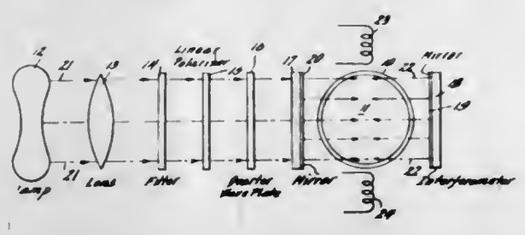
3,271,692
DIFFERENTIAL AMPLIFIER AND COMMUTATOR SYSTEM
David C. Kalbfell, 941 Rosecrans St., San Diego, Calif.
Filed Mar. 15, 1962, Ser. No. 179,878
4 Claims. (Cl. 330—69)

1. In a commutation system, means for measuring true differential signal voltage in the presence of common mode voltage and amplifier back current comprising, in combination, a plurality of differential signal sources, a plurality of shielded two conductor lines each having one of said signal sources connected across the terminals at one end thereof, a plurality of capacitors, each of said conductor lines having one of said capacitors connected across the terminals at the other end of the line, each said capacitor continuously tracking and holding the signal voltage produced by the signal source connected across its line thereby to provide a virtual zero resistance source whereby spurious signal voltage effects due to impedances in the line are substantially avoided and the effective magnitude of the common mode voltages is reduced by at least an order of magnitude, a differential amplifier having two inputs and an output, and commutation means operable to connect said two conductor lines in sequence to said amplifier inputs each respectively at said terminals at said other end thereof thereby to connect said capacitors in sequence across said amplifier inputs whereby the capacitor held voltages are commutated into the amplifier and the amplified signal voltages appear in sequence across said amplifier output, said commutation means having a sampling period which is short compared to the time between samples thereby substantially to avoid depletion of said capacitor held voltages at the amplifier inputs while the same are being commutated into the amplifier, each of said capacitors having a value which lies between minimum and maximum values and providing a signal charging RC time



constant which is short compared to said time between samples and a discharge RT time constant with respect to said inputs of the amplifier which is long compared to said sampling period.

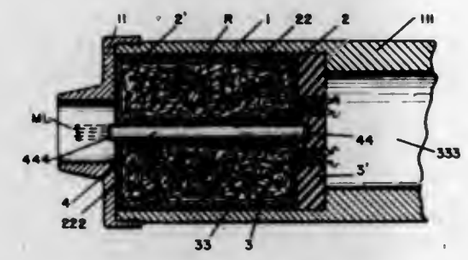
3,271,693
BAND REJECTION FILTER
William E. Nicholson, Jr., Penfield, N.Y., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Army
Filed Oct. 1, 1962, Ser. No. 227,343
4 Claims. (Cl. 330—84)



1. A band rejection filter comprising a source of a relatively broad band of signal frequencies, an output coupling transformer, the primary winding of said transformer being center tapped, an untuned amplifier coupled between said source and one terminal of said primary winding, a tuned amplifier coupled between said source and the other terminal of said primary winding, said tuned amplifier comprising a resonant circuit coupled across the input of the amplifier, a feedback circuit coupled between the output of said tuned amplifier and an intermediate point on said resonant circuit for regeneratively recirculating selected frequencies of said spectrum for increasing the selectivity, Q, of said amplifier.

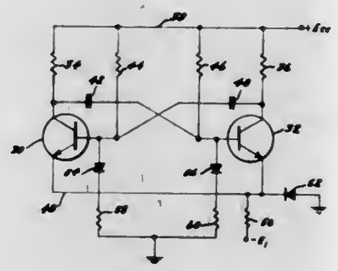
3,271,694
VARIABLE FREQUENCY PHASE SHIFT OSCILLATOR
Neil L. Brown, El Cajon, Calif., assignor to The Bissett-Berman Corporation, Santa Monica, Calif., a corporation of California
Filed Aug. 15, 1963, Ser. No. 302,351
14 Claims. (Cl. 331—66)

3. In combination in an oscillator:
a differential amplifier having a pair of sides each connected to receive an individual signal, the differential amplifier being effective to amplify the difference between the signals introduced to said sides and produce an amplified signal having characteristics representing such difference,
phase shifting means interconnected with said differential amplifier for shifting the phase of said amplified signal, said phase shifting means being responsive to the frequency of said amplified signal for shifting the phase of said amplified signal by an angle dependent upon the frequency of said signal,
first means connected to said phase shifting means to produce a first signal having a particular amplitude and a second signal having a variable amplitude and a fixed phase difference from said first signal,
second means interconnected with said first means to produce a resultant signal having a phase angle that is substantially equal to the phase shift produced in said phase shifting means at said frequency of said amplified signal, said second means being interconnected with one side of said differential amplifier to feed said resultant signal to said side for amplification of the difference between this signal and the signal introduced to the other side, and
feedback means interconnected with the output from said amplifier means to feed a portion of the amplified signal from said amplifier back to the other side of said amplifier means.



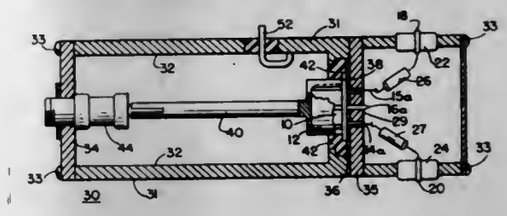
3,271,695
REGENERATIVE OPTICAL PUMPING SYSTEM
John W. Marini, Washington, D.C., assignor to Litton Systems, Inc., College Park, Md.
Filed May 8, 1962, Ser. No. 193,178
5 Claims. (Cl. 331—94.5)

5. An optical pumping system comprising:
an absorption cell containing a microwave resonant medium and being transparent to photon radiation at the resonant frequency of the medium,
an optical system being energizable by a source of photon radiation at the resonant frequency of the medium, and comprising means for producing circularly polarized photon radiation at that frequency,
an interferometer being illuminated by said circularly polarized radiation for regeneratively applying the radiation to the absorption cell,
said interferometer providing a resonant cavity for the photon radiation at the resonant frequency thereby to produce standing waves of circularly polarized radiation within said medium to traverse said medium more than twice in order to increase the photon energy transfer to said medium.



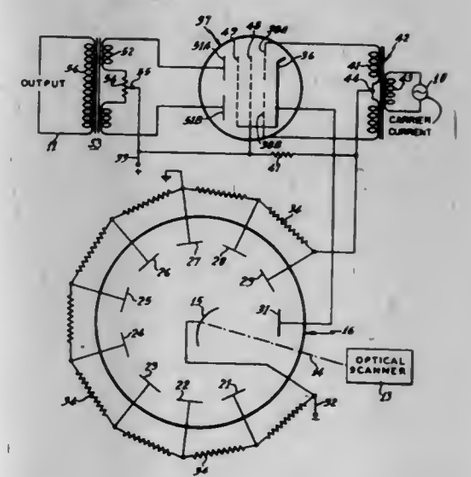
3,271,696
CHEMICALLY PUMPED LASER USING CHEMICAL CARTRIDGE FOR LASER PUMPING
Jack De Ment, 4847 SE. Division St., Portland, Oreg.
Filed July 10, 1962, Ser. No. 208,843
5 Claims. (Cl. 331—94.5)

1. A transducer system for converting chemical energy into light characterized as coherent which comprises a female laser pumping cartridge adapted to receive a male laser light-emitting member, a male laser member within said cartridge, said female laser pumping cartridge comprising a transparent shock-proof envelope having an interior wall adapted to receive and optically couple to the said male laser member, end walls, and an outer wall arranged cooperantly with reflection means, said reflection means characterized as throwing light through the said female laser pumping cartridge and into the said laser light-emitting member, the female laser pumping cartridge being substantially cylindrical and the male laser light-emitting member being substantially the same length as the said female laser pumping cartridge, the said female laser pumping cartridge being longitudinally multisected into segments, a loading of chemically reactive, ignitible



material within said female laser pumping cartridge characterized as emitting light of high intensity and of wavelengths stimulating to the said male laser light-emitting member, ignition electrodes inserted through a wall of the said female laser pumping cartridge and means coupled to the said electrodes for the ignition of the said chemically reactive material.

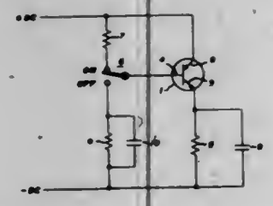
3,271,697
MULTIVIBRATOR WITH STARTING CIRCUIT
Floyd M. Gardner, Reseda, Calif., assignor to the United States of America as represented by the Secretary of the Air Force
Filed May 7, 1965, Ser. No. 454,226
1 Claim. (Cl. 331—113)



A multivibrator circuit comprising: a pair of transistors having a capacitive coupling between the collector of one transistor and the base of the other transistor; a first and second diode and a corresponding first and second resistance, individually serially connected to the base of the two transistors and to a point of steady potential whereby the base potential is not permitted to rise significantly above the potential of said point of steady potential; a third resistor common to the emitters of the two transistors and connecting them to a second steady potential which is negative with respect to said first point of steady potential and producing part of the emitter current; a third diode common to the emitters of the two transistors and connected to said first point of steady potential and producing the remainder of the emitter current, said third diode being so selected that when the circuit is initially activated it will stop conducting and the transistor emitters will begin to rise toward a positive potential preventing saturation thereof.

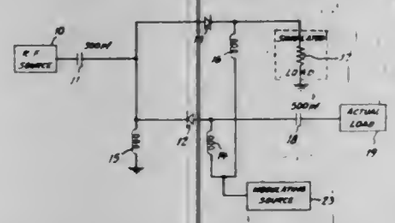
3,271,698
OSCILLATOR WITH RESONANT CIRCUIT CONNECTED TO TRANSISTOR HOUSING
Charles A. Adams, Scottsdale, Ariz., assignor to Motorola, Inc., Franklin Park, Ill., a corporation of Illinois
Filed Jan. 6, 1965, Ser. No. 423,682
5 Claims. (Cl. 331—117)

1. A resonator structure for an ultra high frequency oscillator employing a transistor having a conducting housing connected to an element thereof, the resonator structure including in combination, a hollow conducting structure having end walls, means supporting the transistor housing on one of said end walls and forming a capacitive coupling therebetween, an elongated conducting member in electrical contact with the transistor housing and extending coaxially within said hollow conducting structure, capacitor means coupling the other end of said hollow conducting structure with said coaxial conducting member, with said conducting structure, said member and said capacitor means conjunctively forming a resonant circuit.



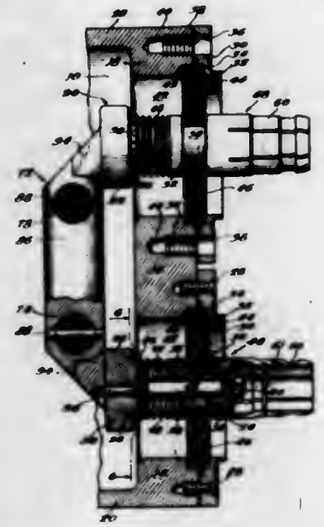
3,271,699
BALANCED MODULATOR HAVING THE ANODE OF A MULTIPLIER PHOTOTUBE DIRECTLY CONNECTED TO THE CATHODE OF THE MODULATOR TUBE
Peter R. Marzan, New City, N.Y., and John R. Shonnard, Montclair, N.J., assignors to Litton Systems, Inc., Beverly Hills, Calif.
Filed July 19, 1963, Ser. No. 296,306
4 Claims. (Cl. 332—3)

1. A balanced modulator comprising
a twin pentode tube provided with a cathode, a pair of control grids and a pair of anodes,
a signal input circuit connected to said cathode,
a source of steady carrier current connected to said pair of control grids,
an output circuit connected to said pair of anodes,
a multiplier phototube having an anode for generating a signal in said signal input circuit, and



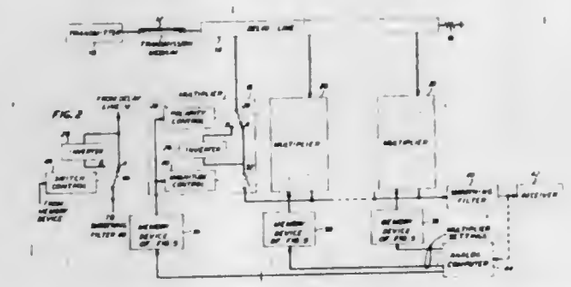
a direct-current source for energizing said twin pentode tube and said phototube, said twin pentode tube, signal input circuit and phototube being connected in series relation across the terminals of said direct-current source, the anode of the phototube being connected to said input circuit.

3,271,700
SOLID STATE SWITCHING CIRCUITS
Frank W. Gutzwiller, Auburn, N.Y., assignor to General Electric Company, a corporation of New York
Filed Mar. 1, 1963, Ser. No. 262,035
16 Claims. (Cl. 332—14)



1. A circuit for controlling the state of conduction of a gate turn off switch comprising:
(a) a gate turn off switch having an anode, a cathode, and a gate,
(b) said anode being connected to a positive power supply terminal,
(c) said cathode being connected through a load resistance to a negative power supply terminal,
(d) means to connect said gate to a potential source which renders said gate positive relative to said cathode to turn said gate turn off switch "on" and to connect said gate to said negative terminal to turn said gate turn off switch "off."

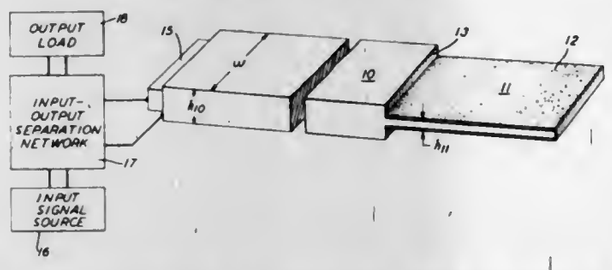
3,271,701
RADIO FREQUENCY AMPLITUDE MODULATOR ALTERNATELY PASSING ENERGY TO ONE OF TWO LOADS
Joseph E. Racy, Nashua, N.H., assignor to Sanders Associates, Inc., Nashua, N.H., a corporation of Delaware
Filed May 16, 1963, Ser. No. 280,782
2 Claims. (Cl. 332—42)



1. A circuit for amplitude modulating a radio frequency signal comprising first and second matched loads, a single-ended alternating current signal modulation voltage source, a radio frequency signal source, a first circuit including a diode connecting said radio frequency source with said first load, a second circuit including a diode connecting said radio frequency source with said second load, said diodes being positioned in said first and second circuits so as to have opposite polarity with respect to said radio frequency signal source, and means for simultaneously applying to said first and second circuits between said diodes and said loads the output of said signal modulating source, said output being applied in the same sense to both diodes so that appropriate diodes conduct alternately.

3,271,702
COAXIAL TRANSFER SWITCH
Eric G. Book, Mokena, Ill., assignor to Andrew Corporation, Orland Park, Ill., a corporation of Illinois
Filed Oct. 17, 1960, Ser. No. 63,029
16 Claims. (Cl. 333—7)

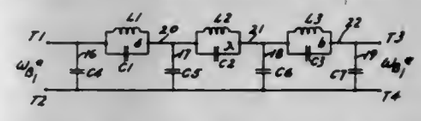
3. A coaxial switch comprising a conducting cavity, a rotor in the cavity, at least four coaxial connectors having outer conductors grounded to the cavity and having stationary inner conductors insulatedly supported symmetrically about the rotor, at least two bridging conductors each adapted to contact a pair of inner conductors and insulatedly mounted on the rotor in positions wherein the respective bridging conductors contact different pairs of inner conductors in each position of the rotor, at least one conducting shield on the rotor substantially entirely in the region between the bridging conductors and extending from the rotor substantially to the side walls of the cavity to divide the cavity into portions each containing a bridging conductor conductively enclosed only by the walls of the cavity and the shield and forming a transmission path of impedance matched to that of the connectors, and means for grounding the shield to the cavity, each bridging conductor being the inner conductor of a coaxial transmission path and the shield forming only the portion of the outer conductor in the direction of the other bridging conductor, the remainder of the outer conductor of each coaxial transmission path being different portions of the faces and side walls of the cavity in each rotary position of the switch.



3,271,703
TRANSVERSAL FILTER
Reginald A. Kaenel, Bethesda, Md., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Dec. 21, 1962, Ser. No. 246,378
3 Claims. (Cl. 333—28)

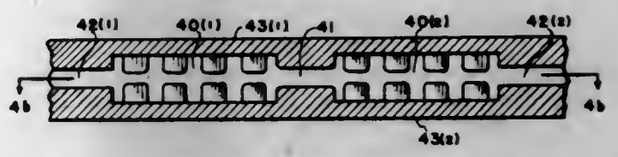
2. A transversal filter comprising a delay line, an input terminal connected to said delay line, a signal source having an upper frequency component limit connected to

said input terminal, taps situated along the length of said delay line, a utilization circuit, and a signal multiplier corresponding to each of said taps, for applying a factor between +1 and −1 in multiplying relation with the signal appearing at each tap, said signal multipliers each comprising an input circuit connected to its respective tap, an output circuit connected to said utilization circuit, switching means operable at a rate at least as high as twice said upper frequency component limit for selecting the polarity, inverted or uninverted, of signal transfer between said input circuit and said output circuit, the duty cycle of said switching means determining the multiplying factor and hence extent of signal transfer therethrough, a bistable signal source the output of which controls the duty cycle of said switching means, a high remanence magnetic core the continuity of which is interrupted by an air gap, a strip of saturable magnetic material of much smaller cross section than said core situated to intercept magnetic flux flowing in said core, a read-out coil adapted to produce voltage pulses signifying changes in state of flux density in said strip, said voltage pulses generated by said read-out coil being applied to synchronize said bistable device, a driving coil adapted to magnetize said strip, and a periodic signal source connected to said driving coil, whereby the duration between successive ones of said pulses is a measure of the flux in said core.



3,271,704
ULTRASONIC DELAY DEVICE
Arthur H. Fitch, Mountain Lakes, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Mar. 25, 1963, Ser. No. 267,714
6 Claims. (Cl. 333—30)

2. In combination, an ultrasonic delay line having a parameter that determines the cut-off frequency of the second longitudinal mode of ultrasonic wave propagation therein, means for applying an ultrasonic wave including components of the first and second longitudinal modes to a first portion of said line, said parameter in said first portion determining a cut-off frequency for said second mode therein that is below the lowest frequency component in said wave, said parameter in a second portion of said line determining a cut-off frequency for said second mode therein that is above the highest frequency component in said wave, said first portion having a length which is a function of a predetermined delay characteristic unique to said second longitudinal mode which characteristic is to be introduced to said applied ultrasonic wave, and means coupled to said second portion for damping wave motion therein.

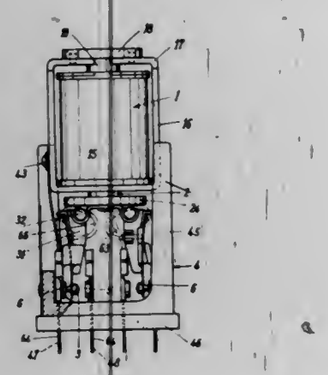


3,271,705
ELECTRIC WAVE FILTER
Edward M. Karkar, San Francisco, Calif., assignor, by mesne assignments, to Communication Equipment Design, Inc., Reno, Nev., a corporation of Nevada
Filed Oct. 6, 1961, Ser. No. 143,371
14 Claims. (Cl. 333—76)

1. In an electric wave filter of the type having a pass band and a stop band, said electric wave filter comprising at least seven impedance arms which are the synthesis of at least a pair of matched indivisible four arm sections characterized by one resonant circuit common to both sections, said filter having two input terminals and two output terminals with predetermined input and output image impedance functions in the pass band, the input and output image impedance functions being capable of being expressed in equations containing poles and zeros where the zeros are the points where the function equals zero and the poles are the points where the function equals infinity, the filter also having a predetermined attenuation function in the stop band, the attenuation function being capable of being expressed in an equation containing poles and zeros, the filter also having a predetermined cut-off frequency, the filter having at least three tuned

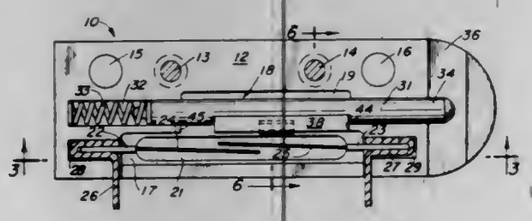
circuits forming at least three tuned resonances, the resonances of the tuned circuits providing at least three attenuation poles in the stop band, said attenuation poles being arbitrarily positioned with respect to the poles and zeros defined by the equations of both the input and output image impedance functions of the filter, said attenuation poles also being positioned arbitrarily with respect to the cut-off frequency of the filter and with respect to each other, said filter and pass band having a substantially flat and rippleless attenuation characteristic, a substantially linear and rippleless phase and group delay characteristic, and a substantially resistive image impedance characteristic.

3,271,706
MICROWAVE FILTER
John P. Rooney, Palo Alto, Calif., assignor to General Electric Company, a corporation of New York
Filed Dec. 7, 1964, Ser. No. 416,246
9 Claims. (Cl. 333—73)



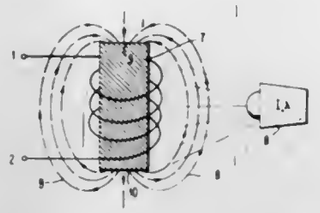
1. A microwave filter system comprising: a plurality of waffle-iron filter sections for preventing passage of predetermined electromagnetic waves, said filter sections having the characteristic of giving rise to spurious responses; and means for suppressing said spurious responses comprising electromagnetic wave transmission means connecting said filter sections, said means being designed to prevent transmission of said spurious responses.

3,271,707
ELECTROMAGNETIC RELAY OF THE BISTABLE TYPE
Gérard Koehler, Saint-Cloud, France, assignor to Société Chauvin Arnoux et Cie, Paris, France
Filed Nov. 9, 1964, Ser. No. 409,781
Claims priority, application France, Nov. 15, 1963, 953,818
8 Claims. (Cl. 345—78)



1. A bistable electromagnetic relay comprising an electromagnet having a winding with an axial duct provided therein, means to feed said winding with control impulses of opposite polarities, a magnetic circuit associated with said electromagnet, said circuit comprising a stationary core at least partially housed in said axial duct, a second core slidably mounted along said axial duct between a working position where the airgap between said both cores is minimum and a rest position where said airgap is maxi-

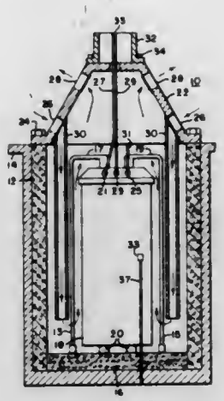
mum, a movable armature fitted on said slidable core, resilient means engaging said armature and tending to return said slidable core toward said rest position, one of said cores being constituted by a magnetic material of low coercivity adapted to be magnetized by those of said impulses having a definite polarity and to be partially demagnetized by those of said impulses having the opposite polarity, the magnetic properties of said one core being so related to said resilient means that when said circuit is open after said magnetization the magnetic



force urging said slidable core toward said working position is greater than the force of said resilient means urging said slidable core toward said rest position both in said working position and in said rest position, and when said circuit is open after said demagnetization the force of said resilient means urging said slidable core toward said rest position is greater than the magnetic force urging said slidable core toward said working position both in said rest position and in said working position.

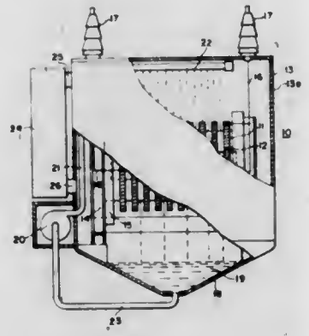
3,271,708
PLUNGER OPERATED MAGNETIC REED SWITCH
Maurice D. McCormick, Prospect Heights, Ill., assignor to Microdyne, Inc., Wheeling, Ill., a corporation of Illinois
Filed Oct. 29, 1964, Ser. No. 407,434
1 Claim. (Cl. 335—205)

A switching device comprising:
a two-piece molded plastic housing having aligned, substantially totally enclosed, contiguous switch and plunger chambers formed between the two halves of the housing;
a magnetically actuatable switch mounted in said switch chamber and having at least two electrically conductive leads, said switch being actuatable between first and second operating conditions in response to the presence and absence of a magnetic field in given alignment therewith;
at least two spring clip electrical connectors, one for each switch lead mounted in said switch chamber and projecting outwardly thereof;
a plunger assembly comprising a non-magnetic plunger mounted in said plunger chamber for axial movement therein between first and second operating positions, said plunger projecting outwardly of one end of said chamber;
said plunger assembly further comprising a permanent magnet mounted on said plunger in position to actuate said switch, through the field of said magnet, between its first and second operating conditions in response to movement of the plunger between its first and second operating positions;
biasing means normally maintaining said plunger in its first operating position, said biasing means comprising a compression spring mounted in the end of said plunger chamber opposite said one end and biasing said plunger toward said one end;
and a pair of stop members in said housing adjacent opposite ends of said plunger assembly, positioned to engage complementary stop surfaces on said plunger assembly to limit axial movement of said plunger assembly, thereby defining the limits of said first and second operating positions for said plunger,
said switch, said connectors and said plunger assembly all being mounted first in one half of the housing and being secured therein upon mounting of the second half of the housing on said one half.



3,271,709
MAGNETIC DEVICE COMPOSED OF A SEMICONDUCTING FERROMAGNETIC MATERIAL
Siegfried J. Methfessel, Montrose, and Frederic Holtzberg, Pound Ridge, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Sept. 9, 1963, Ser. No. 307,521
10 Claims. (Cl. 335—209)

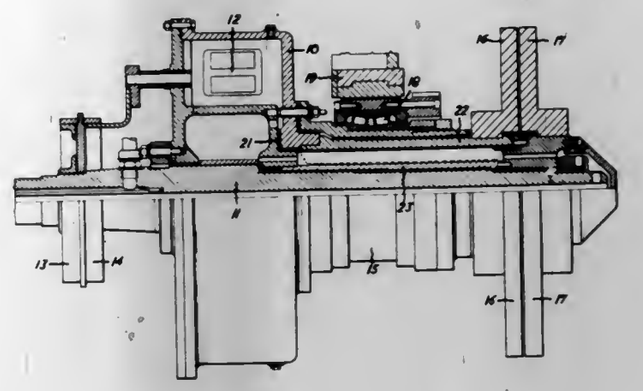
1. A variable magnetic flux device comprising:
(a) a body of semiconducting ferromagnetic material;
(b) means for applying a magnetic field to said body;
(c) a variable means operative to vary conduction carrier density in said body in order to vary the magnetic flux of said body in accordance with the variation of said last-named means.



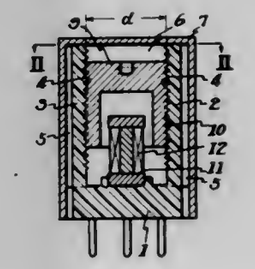
3,271,710
COOLING SYSTEMS FOR UNDERGROUND TRANSFORMERS
Merrill G. Leonard, Brookfield Township, Ohio, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed Mar. 6, 1964, Ser. No. 349,895
6 Claims. (Cl. 336—55)

1. In combination, an enclosure; electrical inductive apparatus disposed within said enclosure; a cover having a sloping side portion forming a substantially dome shape, with its side portion sloping inwardly from the bottom portion of said cover to its top portion; said cover being disposed over said enclosure; said cover having at least one opening disposed near its top portion, and at least one opening disposed near its bottom portion, with said at least one opening disposed near its bottom portion being disposed in the side portion of said cover; and duct means extending downwardly from said at least one opening near the bottom portion of said cover to the lower portion of said enclosure; said electrical inductive apparatus heating the surrounding air when energized and starting air circulation, with the air heated by said inductive apparatus rising and being discharged through said

at least one opening near the top portion of said cover and air being drawn into the enclosure through said at least one opening near the bottom portion of said cover through said duct means to the lower portion of said enclosure.



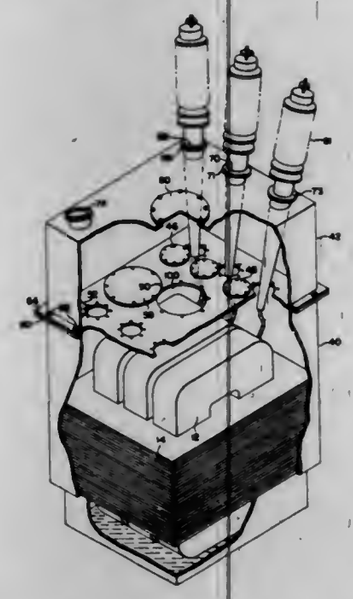
3,271,711
INSULATED ELECTRICAL APPARATUS
Daniel Berg, Churchill Boro, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Continuation of application Ser. No. 260,794, Feb. 25, 1963. This application Mar. 2, 1965, Ser. No. 438,466
3 Claims. (Cl. 336—57)



1. An electrical apparatus comprising an enclosed casing, a source of heat disposed within said casing, a supply of liquid for dissipating the heat from said source of heat, said liquid being selected from the group consisting of $C_4F_9SF_5$, $(C_4F_9)_2SF_4$, and $(C_3F_7)_2SF_4$, and means for distributing said liquid over said source of heat to cool it by evaporation of said liquid.

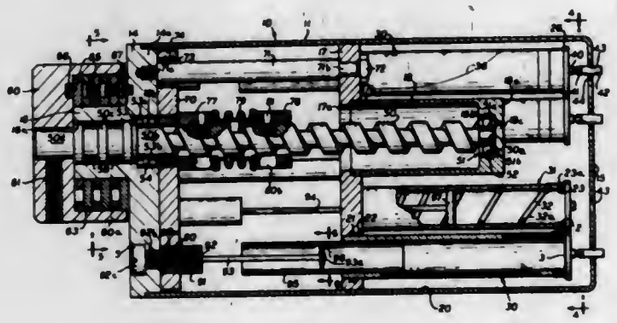
3,271,712
ROTARY ELECTRIC TRANSFORMERS FOR TUBE WELDING
Harry Osborne Bradshaw, Birmingham, England, assignor to Tube Products Limited, Birmingham, England, a British company
Filed Nov. 27, 1963, Ser. No. 326,451
Claims priority, application Great Britain, Nov. 27, 1962, 44,761/62
2 Claims. (Cl. 336—82)

1. A rotary transformer incorporating a single-turn secondary connected electrically to axially offset circular electrodes by conductors passing through a throat of reduced diameter mounted in a bearing, wherein said conductors comprise concentric inner and outer sleeves, longitudinally extending angularly spaced portions on the inner sleeve extending outwardly therefrom, and complementary longitudinally extending angularly spaced portions on the outer sleeve extending inwardly therefrom, said portions on the two sleeves being interengaged when the sleeves are in assembled relationship and the adjacent surfaces of said portions being substantially parallel and spaced from each other.



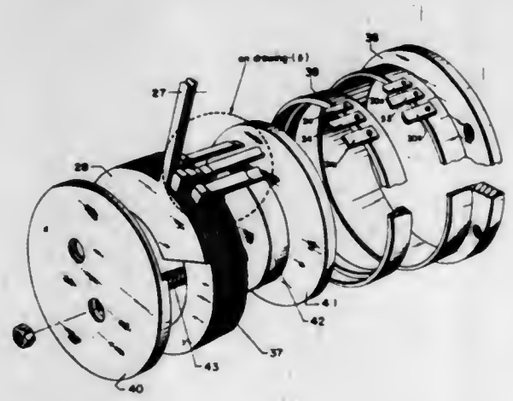
3,271,713
CONSTANT TORQUE ADJUSTMENT FOR VARIABLE IMPEDANCE DEVICES
Masaomi Oshima, Yokohama-shi, Japan, assignor to Oshima Musen Co., Ltd., Yokohama-shi, Japan, a corporation of Japan
Filed Nov. 7, 1963, Ser. No. 322,079
Claims priority, application Japan, Nov. 10, 1962, (utility model), 37/67,126
1 Claim. (Cl. 336—83)

A high frequency coil device comprising an insulating supporting plate, an I-shaped core mounted on said insulating supporting plate, a coil carried by said core, a pair of parallel pillars which extend upwardly from the marginal side portions of said insulating supporting plate and which have screws on the inside thereof, a cylindrical ferrite core having outer screws meshing with said screws of the pillars, a pair of opposed supporting plates, each having curved edges at the both ends thereof which respectively engage with the outer surfaces of said pillars along the entire height thereof, thereby maintaining a predetermined distance between said pillars, and a metallic shield case which covers said opposed supporting plates, said metallic shield case having projections which engage and push said confronting supporting plates inwardly to press the same against the outer sides of said cylindrical ferrite core.



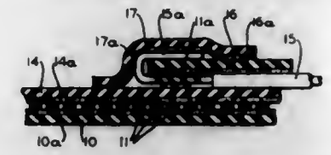
3,271,714
ELECTRICAL INDUCTIVE APPARATUS HAVING MEANS TO PREVENT CONTAMINATION
Raleigh J. Cossaart, Muncie, Ind., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Jan. 15, 1965, Ser. No. 425,725
4 Claims. (Cl. 336—90)

1. Electrical inductive apparatus comprising
electrical windings,
a magnetic core,
said electrical windings being disposed in inductive relation with said magnetic core,
a first enclosure section having a top portion which has a plurality of coverable openings therein,
said electrical windings and magnetic core being disposed in said first enclosure section,
a second enclosure section having a top portion and sidewall portions which define a bottom opening,
said second enclosure section being removably secured to said first enclosure section, with the bottom opening in said second enclosure section being disposed over the top portion of said first enclosure,
the top portion of said second enclosure section having a plurality of openings therein,
a plurality of electrical bushing members,
said plurality of electrical bushing members being disposed in the openings in the top portion of said second enclosure section,
means securing said electrical bushing members to the top portion of said second enclosure section,
and means electrically connecting said bushing members with said electrical windings through certain of the openings in the top portion of said first enclosure section.



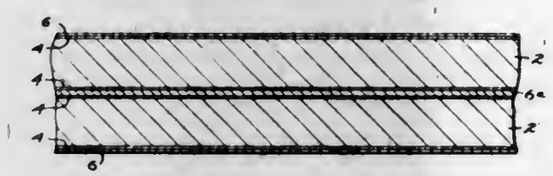
3,271,715
RESILIENTLY MOUNTED CONTACT SLIDABLE ON INDUCTIVE COIL
Nelson Berman, New Hyde Park, and Hugo Selden, Brooklyn, N.Y., and Joseph R. Roy, Wapping, Conn., assignors to JFD Electronics Corporation, Brooklyn, N.Y., an organization of New York
Original application Apr. 18, 1962, Ser. No. 188,458. Divided and this application May 7, 1965, Ser. No. 462,466
2 Claims. (Cl. 336—137)

1. In a tuning device of the type described, an inductor comprising a longitudinally extending insulating tube having a generally spiral groove on the wall of its bore, a conducting first wire embedded in said groove and protruding in said bore and being thereby configured to have inductance, a support outside said tube and longitudinally opposing an end of said tube and having a longitudinal opening, a conducting second wire extending slidably into said opening and also into said tube, means releasably locking said second wire in said opening, a conducting disc fixed to said second wire in said tube and of sufficient diameter so that it engages frictionally between



said first wire and the wall of said bore, said disc having its longitudinal dimension substantially less than the pitch of said groove, means mounting said support and said tube so that they are relatively longitudinally movable, said second wire being stiff but somewhat flexible and resilient so as to move to accommodate tracking movement of said disc along said first wire during relative longitudinal movement of said support and said tube.

3,271,716
HIGH-CURRENT PULSE TRANSFORMER
Harold P. Furth, Berkeley, Calif., assignor to Advanced Kinetics, Inc., Costa Mesa, Calif., a corporation of California
Filed May 28, 1962, Ser. No. 198,273
5 Claims. (Cl. 336—181)

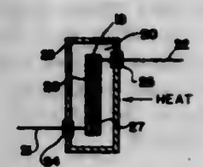


1. A current stepup pulse transformer comprising,
a plurality of multi-turn primary windings in the form of helically wound plates,
means for tapping each said primary winding at its midpoint to provide a pair of midpoint leads,
a plurality of single turn secondary windings in the form of plates, each turn of each said primary winding having an axially adjacent secondary winding,
a pair of output conducting leads coaxial with the axes of said primary and secondary windings,
means for connecting said secondary windings in parallel to said output conducting leads,
and means for connecting said midpoint leads in parallel to said output conducting leads to provide auto transformer operation.

3,271,717
ELECTRICAL COIL CONSTRUCTION EMPLOYING PRESSURE SENSITIVE ADHESIVE
Vincent C. Gilbert, 16800 Quarry Road, Los Gatos, Calif.
Filed June 5, 1961, Ser. No. 114,684
13 Claims. (Cl. 336—192)

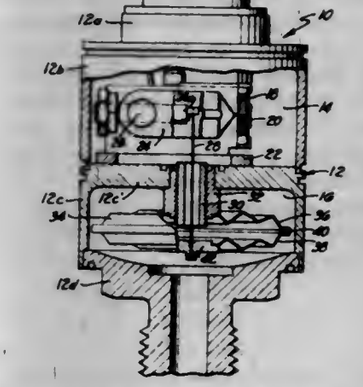
1. An electrical coil comprising two sheets of dielectric material each having an adhesive on one face thereof with the adhesive faces being in opposed relationship, a wire wound between the sheets and embedded in each of the adhesive faces to maintain the wire in the assembled relationship relative to the sheets, one of said sheets serving as a form upon which the wire is wound with the second sheet comprising a cover for the wound wire and wherein the adhesive on each sheet is a pressure sensitive adhesive, the wire having ends, the ends of the wire extending outwardly of said sheets, lead wires connected to the extended wires, and means covering and sealing the connection.

3,271,718
MAGNETIC CORES FOR ELECTRICAL DEVICES AND METHOD OF MANUFACTURE
Beverley A. Shaw, North Reading, Mass., assignor to Tyco Laboratories, Inc., Waltham, Mass., a corporation of Massachusetts
Filed Aug. 6, 1962, Ser. No. 215,092
20 Claims. (Cl. 336—219)



1. A bonded laminated magnetic core comprising a plurality of magnetic iron alloy lamellae each having an insulating coating of silicon monoxide and silicon dioxide bonded thereto by an iron silicate, said lamellae held together by intervening layers of a non-magnetic metal braze bonding material.

6. The method of fabricating a laminated magnetic core comprising the steps of providing a plurality of sheets of magnetic alloy material coated with thin layers of silicon oxide consisting substantially of silicon monoxide, coating said silicon oxide layers with a brazing material, stacking said sheets together, and applying heat sufficient to braze said sheets together whereby to form a single integrated magnetic core.

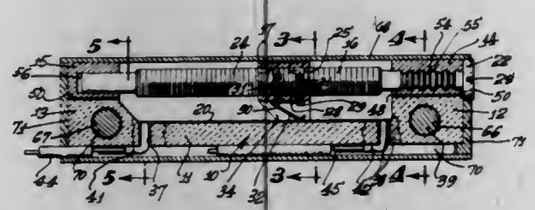


3,271,719
RESISTANCE SWITCHES AND THE LIKE
Stanford R. Ovshinsky, Bloomfield Hills, Mich., assignor to Energy Conversion Devices, Inc., Troy, Mich., a corporation of Delaware
Original application June 21, 1961, Ser. No. 118,642. Divided and this application Oct. 11, 1965, Ser. No. 502,812
7 Claims. (Cl. 338—28)

1. A switch device for an electrical circuit, comprising a closed housing, an element in said housing adapted to be inserted in said circuit, having the characteristics of a predetermined large reversible change of electrical resistance under a predetermined change in temperature, said element comprising a solid metallic material exposed in said housing to an environment confined in said housing and containing a fluid material capable of being adsorbed on the surface thereof in response to said change in temperature, said metallic material having a substantially different electrical resistivity when a substantial amount of said fluid material has been adsorbed thereon than when said fluid material has been substantially desorbed therefrom, spaced apart electrical contacting mem-

bers maintained in electrical contact with the surface of said metallic material, leads extending from said contacting members externally of said housing for connection to said electrical circuit, and means for producing said temperature change, whereby in substantial effect to close and open said circuit without the necessity for mechanical motion of said element to make or break an electrical contact.

3,271,720
CORRECTOR OR PRESSURE-SENSITIVE DIAPHRAGM OR CAPSULE
Stephen A. Hluchan, Riverside, and Werner R. Hofmann, Bloomington, Calif., assignors to Bourns, Inc.
Filed Nov. 16, 1964, Ser. No. 411,272
12 Claims. (Cl. 338—42)



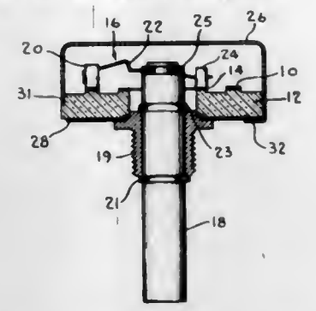
1. A potentiometric transducer comprising, in combination:
first means, including potentiometer means and lever means operably connected to the potentiometer means to operatively vary the latter;
second means, including pressure-sensitive means comprising annularly deformed diaphragm means of substantially circular shape and of material characterized by a predetermined thermal coefficient of expansion, said diaphragm means arranged with a surface to be exposed to fluid under pressure to be deformed thereby to translate a movable portion of said diaphragm means as a measure of the applied pressure, and said second means including connecting means connecting said movable portion to said lever means to operate the latter incident to movement of said movable portion of said diaphragm means incident to deformation of the latter;
third means, including housing and support means for said first and second means, said third means providing a chamber and a fluid-admission passage thereinto and providing a seal and support for said diaphragm means; and

fourth means, including a ring annulus fusion-united to said diaphragm means at the periphery of the latter, said ring annulus being formed of a selected material characterized by a predetermined thermal coefficient of expansion different from that of said diaphragm means;

whereby with constant pressure applied to said diaphragm means the tendency of said diaphragm means to change dimension and move said connecting means and lever means incident to change of the ambient temperature at said transducer is compensated and corrected by the tendencies of said diaphragm means and said ring annulus to expand differently due to the differing thermal coefficients of expansion thereof.

3,271,721
RECTILINEAR POTENTIOMETER
James F. Gordon, San Marino, Calif., assignor to Beckman Instruments, Inc., Fullerton, Calif., a corporation of California
Filed May 10, 1956, Ser. No. 584,088
7 Claims. (Cl. 338—183)

3. In a miniature potentiometer, the combination of: an elongated body having bearing saddles on one side adjacent each end thereof and a channel in a side opposite said one side with a plurality of terminal openings in said body providing communication between said channel and said one side; an elongated film of resistance material fired on said one side between said saddles; an elongated film of conducting material fired on said one side between said saddles substantially parallel to said resistance material; a film of metallic material of relatively high melting temperature fired on each of said bearing saddles; bearings of relatively low melting temperature fixed to each of said metallic films in said bearing saddles; a shaft rotatably mounted in said bearings, said shaft having a threaded section positioned between said bearings; contact means for electrically connecting said resistance material and said conducting material, said contact means being carried by the threaded section of said shaft, said contact means including means engaging said threaded section of said shaft and means preventing rotation of said contact means as said shaft is rotated so that rotation of said shaft advances said contact means along said resistance material; and a plurality of electrical conductors positioned in said channel and extending through said terminal openings for coupling said resistance and conducting films to an electrical circuit.



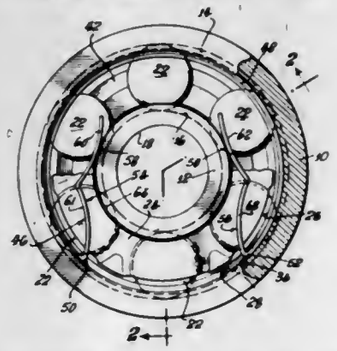
3,271,722
ELECTRICAL COMPONENT AND THERMALLY IMPROVED ELECTRICAL INSULATING MEDIUM THEREFOR
William W. Garstang, Milwaukee, Wis., assignor to Globe-Union Inc., Milwaukee, Wis., a corporation of Delaware
Filed Dec. 3, 1963, Ser. No. 327,692
2 Claims. (Cl. 338—306)

1. An electrical circuit component comprising, in combination,

a substrate of electrical insulating material,

a current carrying circuit element subject to self-generation of heat upon the passage of electrical current therethrough,

said current carrying circuit element supported on said substrate and in direct heat transfer engagement therewith and said substrate effective to draw said self-generated heat from said current carrying circuit element so that said substrate functions as a heat sink for said current carrying circuit element to dissipate said self-generated heat,



said substrate characterized by having a quantity of beryllium oxide dispersed therein as a filler to enhance the heat transfer properties thereof,

a housing including a portion extending coextensively with and adjacent a portion of said substrate,

and means comprising a quantity of beryllium oxide dispersed in a fluid carrier disposed substantially throughout the juncture between said substrate and housing portions to complete a heat transfer connection between said substrate and housing portions.

3,271,723
CONDUCTIVE BALL BEARING
Richard G. Willing, Los Angeles, Calif., assignor to Federal-Mogul-Bower Bearings, Inc., Detroit, Mich., a corporation of Michigan
Filed May 4, 1964, Ser. No. 364,682
10 Claims. (Cl. 339—5)

1. In an electrically conductive bearing having inner and outer bearing race members rotatably supported coaxially of one another by an intermediate complement of rolling bearing members, apparatus comprising:

a radially facing, annular groove formed in one of said bearing race members;

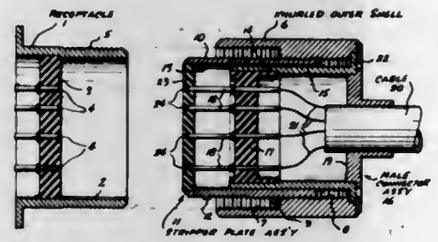
a resilient, arcuate, electrically conductive member retainingly engaged in said annular groove,

and said conductive member having an integrally formed, transversely extending arm positioned in sliding contact with the adjacent surface of the other of said bearing race members.

3,271,724
STAKE ON CONTACT
Louis C. Brieger and Henry R. Barta, Dallas, Tex., assignors to The Atlantic Refining Company, Philadelphia, Pa., a corporation of Pennsylvania
Filed Jan. 3, 1963, Ser. No. 249,282
7 Claims. (Cl. 339—22)

1. An improved geophysical jumper cable adapted to receive a geophone comprising

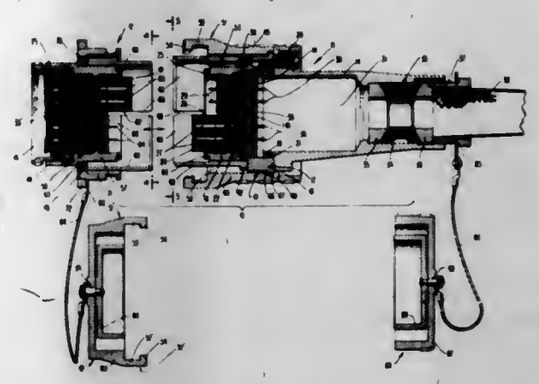
(a) a cable containing first and second conductors insulated from each other, said cable having notches formed in the sides thereof to expose alternate sections of said conductors, said exposed sections being spaced from each other and positioned generally along the longitudinal axes of their respective unexposed sections,



(b) a geophone take out positioned along at least a portion of said cable, said take out including

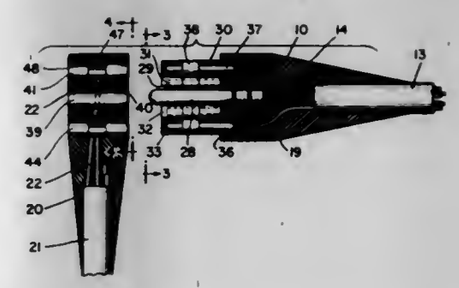
(1) a first electrically conductive member positioned around a major portion of the cable's periphery, said first member electrically connected to one of said exposed sections of said first conductor,

(2) a second electrically conductive member positioned around a major portion of the cable's periphery, said second member electrically connected to one of said exposed sections of said second conductor located adjacent said first member.



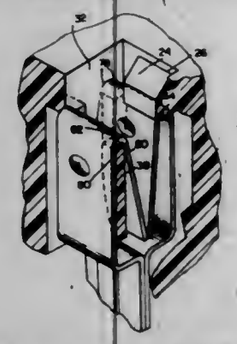
3,271,725
ELECTRICAL CONNECTOR
Joseph T. Bloch, Seattle, Wash., assignor to The Boeing Company, Seattle, Wash., a corporation of Delaware
Filed Sept. 30, 1963, Ser. No. 312,522
4 Claims. (Cl. 339—42)

1. An electrical connector comprising in combination: a connector unit and a receptacle unit; said connector unit including a movable outer shell having a pair of threaded portions; a connector assembly including a member operatively connected to said outer shell, and means for holding a plurality of connector pins; a stripper assembly including a housing portion and a plate portion, said housing portion having a threaded portion coacting with one of said threaded portions of said shell, said plate portion having a plurality of apertures through which said pin means are adapted to move; said connector assembly and said stripper assembly being provided with means to prevent rotation therebetween; said receptacle unit including a body member and a plate member, said plate member having a plurality of connector sockets, said body member including a threaded portion adapted to coact with the other thread portion of said shell; and means for aligning said connector unit and said receptacle unit.



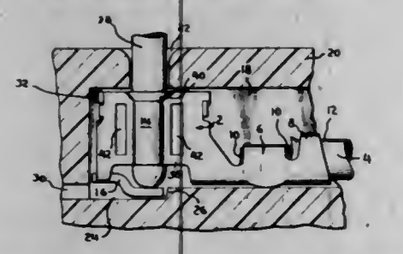
3,271,726
ELECTRICAL CONNECTOR
Donald L. Pfendler, Sidney, N.Y., assignor to The Bendix Corporation, Sidney, N.Y., a corporation of Delaware
Filed Nov. 2, 1961, Ser. No. 149,574
4 Claims. (Cl. 339—49)

1. In an electrical connecting device, a laminated stack of thin discs of electrical insulation cemented together, said stack having a plurality of openings therethrough, electrically conductive printed circuit elements applied to surfaces of said discs, each said element having a terminal portion adjacent each of at least two of said openings and being segregated from the other said openings by the cemented together disc surfaces adjacent thereto, a metallic contact extending through each said opening in sliding engagement with the walls thereof, solder means, applied to said elements before lamination of said



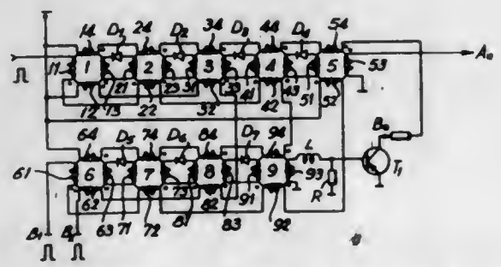
stack and fused after the insertion of said contacts into said openings, for electrically connecting each said contact to only one of said printed circuit elements between any two adjacent discs, and a resilient contact supporting member having openings mating with the openings in said stack for receiving said contacts, said contacts having interlocking relation with said supporting member within the openings in the latter.

3,271,727
FLUID PROOF MULTIPLE CONNECTOR
Arthur L. Nelson, San Diego, Calif., assignor to Winsco Instruments & Controls Company, Inc., a corporation of California
Filed Sept. 27, 1965, Ser. No. 490,250
12 Claims. (Cl. 339—60)



1. A fluid proof multiple connector comprising, in combination: a plug body including at least two elongated plugs of substantially uniform circular cross-sections throughout substantially their lengths and including respectively plug contacts having surface portions exposed in substantially flush relationship with the remaining exterior surfaces of said plugs intermediate their ends; and a socket body including at least two elongated sockets of substantially uniform circular cross-sections throughout lengths corresponding to the circular cross-sections and lengths of said plugs respectively, and including socket contacts having exposed surfaces at areas of the interior walls of said sockets intermediate their ends, whereby said plugs may be received in said sockets respectively while underwater to effect electrical contact between said plug and socket contacts with the remaining engaging portions of the exterior surfaces of said plugs and interior wall surfaces of said sockets on either side of said contacts excluding water from said contacts.

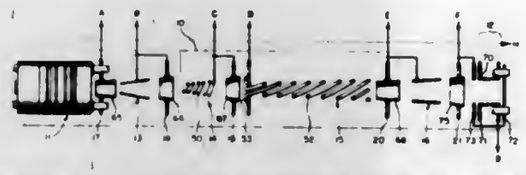
3,271,728
ELECTRICAL CONNECTOR
Alvah D. Beauchaine, Lakeport, N.H., assignor to W. A. Beauchaine & Sons, Inc., Lakeport, N.H., a corporation of New Hampshire
Filed Sept. 12, 1963, Ser. No. 308,437
3 Claims. (Cl. 339—217)



1. An electrical connector assembly comprising: a female contact member having a pair of upwardly diverging legs connected at the lower ends thereof and bent inwardly and downwardly at the upper ends thereof to form abutting spring arms; and a dielectric block housing having a receptacle formed therethrough to receive and mount said female contact member therein, said receptacle having vertical side and end walls and being substantially rectangular in horizontal cross-section, said receptacle having a pair of cam members adjacent diagonal corners thereof integral with said side walls, said receptacle having a pair of vertical recesses adjacent the opposite diagonal corners thereof in said side walls, said cam members and said vertical recesses disposed in facing relationship, and stop members integral with said end walls and extending therefrom, said stop members spaced above said cam members whereby said female contact member is adapted to be assembled into said receptacle by initially being inserted upwardly through the bottom opening of said receptacle, its spring arms then being spread by a male probe inserted downwardly therebetween, its contact legs then being cammed into said vertical recesses by said diagonally opposed cam members, said contact legs then recovering to their original configuration after clearing the top of said cam members, said contact member thereby becoming securely seated into said receptacle and prevented from further upward movement by said stop members.

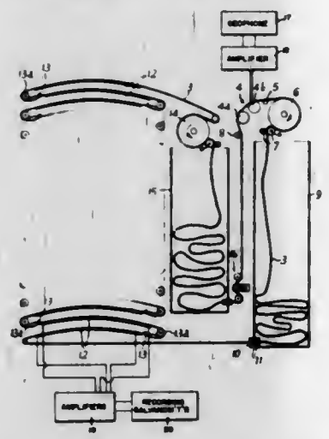
3,271,729
CLUSTER RECEPTACLE WITH BASAL LANCE AND ONE PIECE HOUSING
Roel Bakker and Luciano Obert, Turin, Italy, assignors to AMP Incorporated, Harrisburg, Pa.
Filed Nov. 30, 1964, Ser. No. 414,758
Claims priority, application Italy, Nov. 30, 1963, 24,446/63
6 Claims. (Cl. 339—217)

1. An electrical connector comprising a housing member of dielectric material formed internally with a channel extending therethrough open at one end, said housing member having an aperture in communication with the channel, the channel opposite said aperture being formed with a shoulder, an electrical connector having a receptacle portion being disposed in said channel with said receptacle portion in alignment with said aperture for receiving a connecting pin therethrough, said receptacle portion being provided with detent means engaging said shoulder to prevent said connector from being withdrawn from said channel, said connecting pin being disposable within said receptacle portion and engageable with said detent means to urge said detent means into locking alignment with said shoulder to prevent withdrawal of the connector from said channel.



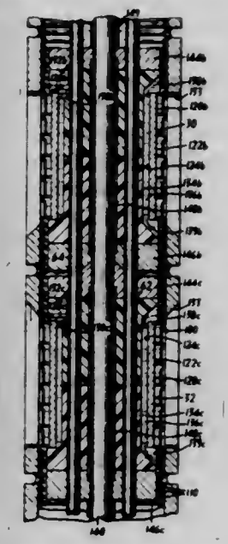
3,271,730
ELECTRICAL COUNTING MECHANISM
Wolfgang Stedtnitz, Bad Ragat, Switzerland, assignor to Aktiebolaget Bofors, Bofors, Sweden
Original application Aug. 24, 1962, Ser. No. 219,345. Divided and this application Oct. 22, 1964, Ser. No. 411,665
Claims priority, application Germany, Aug. 24, 1961, A 38,178
1 Claim. (Cl. 340—3)

For use in echo sounding operations in which impulses are transmitted at the start of successive sounding periods having echo impulse receiving times corresponding to a selected sounding range, and the distance of an object within the selected sounding range is determined by measuring the elapsed time, during each sounding period, at which a transmitted impulse reflected by the object is received as an echo impulse; means for discriminating between disturbance impulses and periodically received echo impulses comprising, in combination, a measurement counter effective to count and store incoming echo impulses; a time counter operable responsive to receipt of successive control impulses of a preselected time sequence, and one of which coincides with a transmitted impulse; means interconnecting said counters; means operable by said time counter to clear said measurement counter when said time counter has counted a first particular number of control impulses during which said measurement counter has not received echo impulses; and means operable by said measurement counter, upon receipt of a second particular number of echo impulses since the last clearance of said measurement counter, or in response to receipt of a particular sequence of echo impulses since the last clearance of said measurement counter, and before said time counter has counted said first particular number of control impulses, to deliver an exit impulse.



3,271,731
ELECTRON BEAM PARAMETRIC AMPLIFIER WITH POSITIVE ION ELIMINATION
Robert Adler, Northfield, Ill., and Charles B. Crumly, Palo Alto, Leigh C. Foster, Atherton, and John P. Lindley, Redwood City, Calif., assignors to Zenith Radio Corporation, Chicago, Ill., a corporation of Delaware
Filed Jan. 7, 1964, Ser. No. 336,197
10 Claims. (Cl. 330—4.7)

1. An electron beam device comprising:
a substantially evacuated envelope;
means for projecting an electron stream along a path at a velocity sufficient to ionize residual gas molecules, said stream exhibiting a potential distribution across its width having a positive potential minimum at its axis tending to attract any positive ions of said gas toward said axis;
means for subjecting said stream to a magnetic field having flux lines parallel to said path for establishing a condition of transverse electron resonance;
an amplifying assembly having an input coupler responsive to input signal energy for imparting motion to said electrons establishing transverse-mode electron waves on said stream, a pump section downstream from said input coupler responsive to applied energy for developing a periodic inhomogeneous field having a periodicity phased with said motion to increase the magnitude of said waves, and an output coupler downstream from said pump section for extracting signal energy from said waves;



a plurality of conductive structures included in said assembly, spaced along said path, and individually spaced about said path to define a drift region and tapering apart in a given direction along said path;
bias means connected to said conductive structures for establishing, together with the taper of said structures, a negative potential gradient along the portion of said path from one of said couplers through the other, said gradient being sufficiently negative to draw said ions in said direction;
means, spaced along said stream in said direction from said couplers and biased at a potential negative relative to that along said portion, for collecting said positive ions;
and means at the downstream end of said path for collecting said electrons.

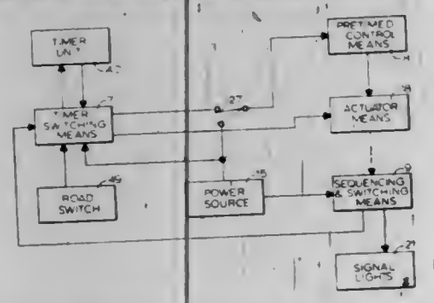
3,271,732
METHOD AND APPARATUS FOR CORRELATING SEISMIC DISTURBANCES AGAINST PREVIOUSLY RECORDED SIGNALS
Nigel Allister Anstey and William Edward Lerwill, Kent, England, assignors to Seismograph Service Corporation, Tulsa, Okla.
Filed Jan. 4, 1963, Ser. No. 249,366
Claims priority, application Great Britain, Jan. 8, 1962, 661/62
15 Claims. (Cl. 340—15.5)

1. A method of obtaining information about a seismic signal for use in identifying its source, which method comprises producing from each of a number of prior seismic signals respectively received at a given receiving location from a variety of sources a longitudinally extending transducer assembly having a sensitivity distributed along its length as a function of the waveform of the corresponding prior seismic signal, producing from a subsequent seismic signal arriving at said location an energy pattern representing the waveform of this subsequent signal, causing said energy pattern to pass along each of the transducer assemblies, developing from each transducer assembly a signal representing the effect of said energy pattern upon that transducer assembly, said signal being indicative of the correlation between the waveform of said subsequent seismic signal and that of the prior seismic signal corresponding to the transducer assembly, and recording the correlation signals obtained from each transducer assembly for comparison, thereby to facilitate identification of the source of said subsequent seismic signal by comparison with the seismic signals received at said location from each of said variety of sources.

3,271,733
ACOUSTIC WELL LOGGING DEVICE
Walter E. Cubberly, Jr., Houston, Tex., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Texas
Filed July 8, 1964, Ser. No. 381,118
9 Claims. (Cl. 340—17)

1. An acoustic well logging device comprising an elongated support member, electroacoustic transducers mounted at spaced-apart locations on said support member, a sleeve of fluid impermeable material surrounding said transducers and having closely spaced transversely extending convolutions in at least the portion thereof between said transducers for restricting the transmission of sonic signals directly between said transducers, and sealing means between said support member and said sleeve to form a fluid tight chamber for said transducers.

3,271,734
TRAFFIC SIGNAL CONTROLLER
Ray W. Cabe, Manhattan Beach, and William C. Sondergard, Torrance, Calif., assignors to Tamar Electronics Industries, Inc., Anaheim, Calif., a corporation of Delaware
Filed Mar. 16, 1964, Ser. No. 352,025
7 Claims. (Cl. 340—37)

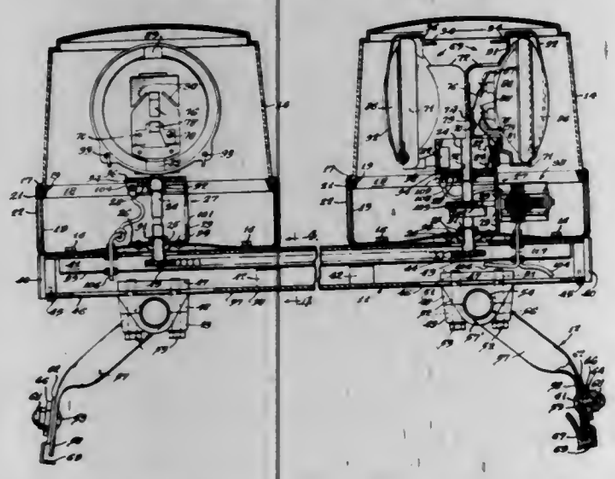


1. In a traffic signal controller for controlling traffic signals at an intersection between streets, said signals including a set of signal lights for each such street,
a power source,
pre-timed control means for providing control signals for said lights in accordance with a predetermined program,

semi-actuated control means for providing control signals for said lights in accordance with traffic conditions on one of said streets,

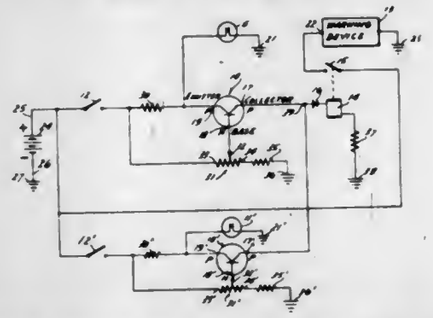
sequencing and switching means interposed between said power source and said signal lights and said power source and said semi-actuated control means for connecting power to said lights and to said semi-actuated control means in a predetermined sequence,

actuator means responsively connected to said pre-timed for actuating said sequencing and switching means, and



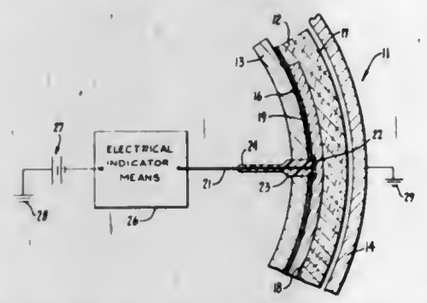
means for alternatively connecting said power source either directly to said pre-timed control means to cause said pre-timed control means to drive said actuator means in accordance with said predetermined program or connecting said pre-timed control means

to said semi-actuated control means to cause said actuator means to be driven in response to said semi-actuated control means,



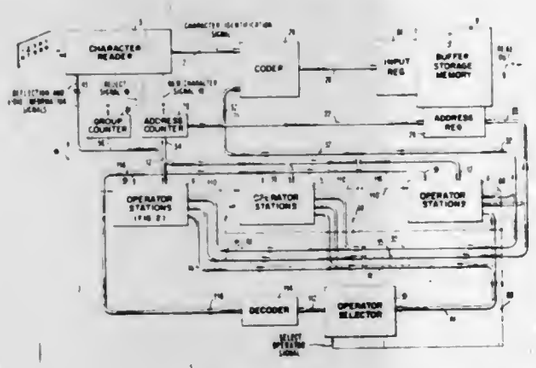
said semi-actuated control means comprising road switch means adapted to be actuated in response to vehicles arriving at said intersection on said one of said streets, timer switching means connected for actuation by said road switch means, and electronic timer unit means connected to said timer switching means for generating predetermined timing signals in response to the actuation of said road switch means, said power source being connected to said electronic timer unit means through said sequencing and switching means and said timer switching means to initiate the generation of said timing signals, said actuator means being actuated by said timer switching means in response to said timing signals.

3,271,735
WARNING DEVICE FOR EMERGENCY VEHICLES
Earl W. Gosswiller, Chicago, Ill., assignor to Federal Sign and Signal Corporation, Blue Island, Ill., a corporation of New York
Filed June 29, 1964, Ser. No. 378,754
10 Claims. (Cl. 340—50)



7. Signal light means comprising an elongate hollow mounting bar; a pair of signal lights mounted adjacent the opposite ends of said bar; each light comprising a base, a light transmitting dome on the base, a shaft journalled on the base and extending upwardly into the dome and downwardly into said bar, lamp means on the upper end portion of said shaft within said dome, and sprocket means on the lower end portion of said shaft within said bar; a motor in one of said lights drivingly connected to the shaft therein; a partition within said bar immediately below and extending between said sprocket means; chain means in said bar above said partition reaved over said sprocket means for imparting the movements of the motor driven shaft to the other of said shafts; said bar fitting closely about said sprocket means whereby said bar and said partition prevent disassociation of said chain means from said sprocket means; and power supply means for said lamp means and said motor extending through said bar below said partition.

3,271,736
TRANSISTORIZED CIRCUIT CONDITION WARNING DEVICE FOR VEHICLES
Richard J. Brown, Rte. 4, Box 270, and Raymond G. Schnick, Rte. 4, Box 53, both of Delavan, Wis.
Filed Aug. 30, 1963, Ser. No. 305,694
3 Claims. (Cl. 340—52)

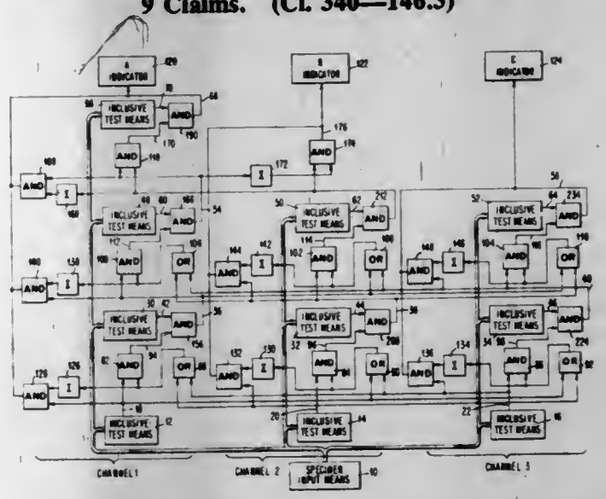


1. A circuit for warning a driver of an undersired condition in an electrical system of an automobile, comprising a battery, an electrical device, a transistor, a warning device and a relay switch having a control coil for actuating the warning device, said control coil being connected to the collector terminal of said transistor, the collector current of said transistor controlling the passage of current through the control coil of said relay; said battery, said switch, said electrical device, and the emitter and base of said transistor being interconnected through conductors and resistors having preselected resistances adapted to permit a collector current to flow in said transistor only when an undesired circuit condition occurs in the circuit between said switch and said electrical device, whereby to close said relay and actuate said warning device, the number of transistors connected to the control coil of said relay being equal to the number of electrical devices and switches, the same terminal of said battery being connected to each said switch, the other terminal of said switch being connected to said electrical device and to the emitter terminal of said transistor through a resistor of a value sufficient to cause a voltage drop of .3 of a volt, the base terminal of said transistor being connected to the center movable contact of a 25 ohm potentiometer, said terminal of said switch which is connected to said electrical device being connected to one end terminal of said potentiometer, and the other end terminal of said potentiometer being connected to a 220 ohm resistor, said 220 ohm resistor being connected to the other terminal of said battery through a ground connection, said control coil of said relay having a resistance of 500 ohms, the terminal of said control coil which is not connected to the collector terminal of said transistor being connected to a 220 ohm resistor, said 220 ohm resistor being connected to the other terminal of said battery through a ground connection, whereby when the said switch is closed and the electrical device is incapable of passing a current a collector current flows in said transistor to actuate said relay and said warning device.

3,271,737
WEAR INDICATING ARRANGEMENT FOR VEHICLE POWER TRANSFER DEVICES
James L. Bezemek, 1454 Dayton Ave., San Leandro, Calif.
Filed Mar. 25, 1964, Ser. No. 354,650
11 Claims. (Cl. 340—52)

1. A wear indicating device for a friction member having a wearing surface for engaging a relatively non-wearing electrically conductive member comprising a conductive region disposed in insulated relation within said friction member at a predetermined depth beneath said wearing surface in a pattern extending under substantially all areas of the surface, insulated lead-in conductor means in electrical connection with said conductive region, an indicator circuit including electrical indicator means and a current source in series, and means for connecting said circuit in conductive relation between said lead-in conductor means and said non-wearing member.

3,271,738
OPERATOR ASSISTED CHARACTER READING SYSTEM
Louis A. Kamentsky, Briarcliff Manor, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Aug. 13, 1963, Ser. No. 301,852
11 Claims. (Cl. 340—146.3)



3. In a character reading system wherein a character reader provides an identification signal for each character recognized and a rejection signal when a rejected character cannot be recognized, the combination with said reader of:

addressing means for providing a corresponding address signal for each character presented to said character reader for recognition;

an operator station including, address storage means connected to receive said address and rejection signals for storing the address signal of a rejected character in response to a corresponding rejection signal, means for locating images of rejected characters, keyboard means for storing a character identification signal selected by manual operation of said keyboard means, and readout means associated with said keyboard means for reading out the identification signal stored in said keyboard means and the address signal stored in said address storage means at a time other than when said reader provides an identification signal; and

storage means including a plurality of memory locations for storing the identification signals from said character reader at memory locations determined by the corresponding address signals from said addressing means, and for storing the identification signal from said keyboard means at a memory location determined by the corresponding address signal stored in said address storage means.

3,271,739
MULTI-LEVEL TEST SYSTEM FOR SPECIMEN IDENTIFICATION
Raymond E. Bonner, Yorktown Heights, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Nov. 1, 1963, Ser. No. 320,786
9 Claims. (Cl. 340—146.3)

1. A recognition system for identifying input specimens as members of given specimen classes comprising,

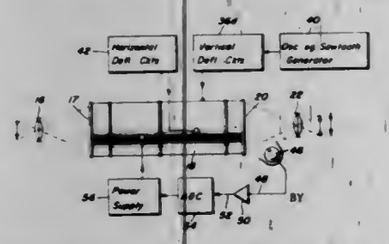
an input means responsive to an input specimen selected from said given specimen classes for generating signals characteristic thereof,

a plurality of test channels connected to said input means, each of said test channels being associated with a separate specimen class, each of said test channels including a plurality of test means directly connected to said input means for performing separate specific tests on said characteristic signals, and for producing an output signal when said test is satisfied,

a first test means of said plurality of test means in each one of said test channels including a test designed to be satisfied by all of the members of the specimen class associated with each said given test channel,

a second test means of said plurality of test means in each of said test channels including a test designed to be satisfied by those members of the specimen classes associated with said given test channel which are capable of satisfying the test included in said first test means in said given test channel and at least one other of the first test means in the others of said plurality of test channels,

the remainder of said plurality of test means in each one of said test channels including tests designed to be satisfied by the members of said specimen class associated with said given test channel which are



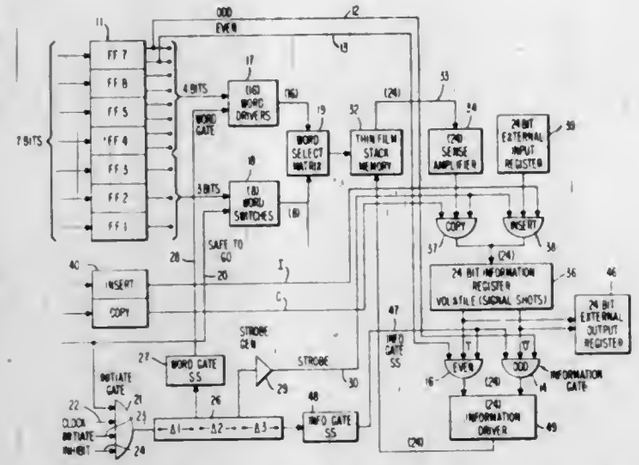
capable of also satisfying each preceding test in said given test channel and at least one other immediately preceding test means in the others of said plurality of test channels,

and gating means connected to each of said test means, said gating means interconnecting the test means in each test channel with given ones of the test means in the other test channels such that said output signals from each test means must be gated by an output signal from the preceding test means in each test channel in combination with an output signal from at least one other preceding test means in said other test channels.

3,271,740
IMAGE REGISTRATION SYSTEM USING AN IMAGE CONVERTER TUBE

Jacob Rabinow, Bethesda, Md., assignor, by mesne assignments, to Control Data Corporation, Minneapolis, Minn., a corporation of Minnesota

Filed Apr. 29, 1963, Ser. No. 276,471
2 Claims. (Cl. 340—146.3)



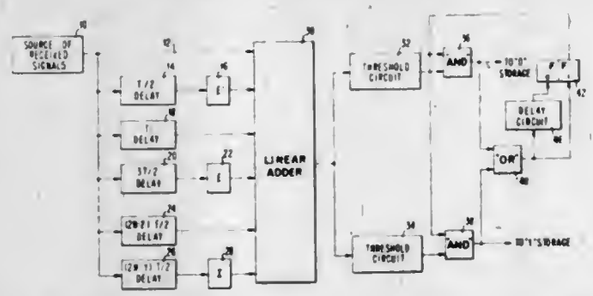
1. In an optical character reading machine for characters on a contrasting background, an image converter tube having a photosensitive emissive surface, means to form a first image of one of said characters on said surface, said tube having a second surface and means responsive to the emissions from said photosensitive surface to form a second image of said character on said second surface, said reading machine including means for examining the character whose image appears on said second surface, optical means in optical alignment with said second surface and said examining means to form an image of the last mentioned character on said examining means for examination by the latter, said image converter tube having vertical deflection means to vertically move the image appearing on said second surface, means including a vertical deflection driving circuit connected to said deflection means to drive said vertical deflection means and thereby vertically move said second image, said tube having a power input terminal, a power supply connected to said terminal, means for controlling the gain of said power supply to thereby regulate the intensity of said second image, photosensitive means exposed to said second surface and arranged to provide a signal corresponding to the light intensity of said second surface on which said second image appears, and means for conducting said signal to said gain controlling means to control the latter.

3,271,741
MAGNETIC MEMORY SYSTEM

Albert M. Bates, Davisville, Pa., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan

Filed Sept. 28, 1962, Ser. No. 226,895
14 Claims. (Cl. 340—172.5)

1. A memory system comprising, in combination, a memory array having rows and columns of bistable state magnetic elements, said array having an even and an odd address portion, input means providing drive current to a selected even or odd address portion, sensing means for detecting "one" or "zero" output information resulting from said drive current, circuit means responsive to said sensing means for directing said sensed output information to an information register, means including an even or odd information gate regenerating said sensed output information back into said memory array at said selected address portion, the output of said even or odd information gate causing an information driver to provide rewrite current in a first or a second direction at said se-



lected address portion, said first or second rewrite current direction being under the control of said even or odd information gate so as to cause said bistable state magnetic elements to be placed in a first reference state in said even address portion and in a second reference state in said odd address portion when storing identical binary information.

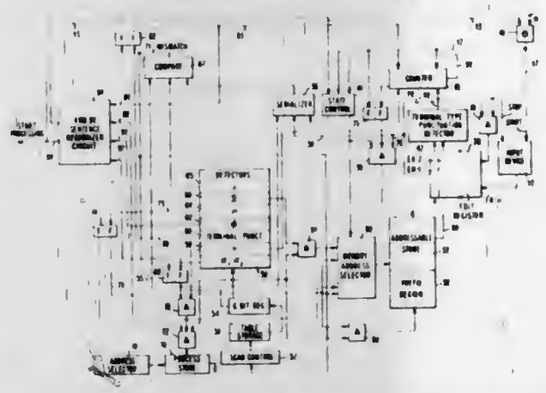
3,271,742
DEMODULATION SYSTEM

Dale H. Rumble, Saugerties, and Hans R. Ulander, Woodstock, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Nov. 6, 1963, Ser. No. 321,797
12 Claims. (Cl. 340—167)

1. A digital data communication system comprising means for producing binary coded signals including means for generating a first plurality of cycles of waveform having positive and negative excursions from a datum which occur in alternate half-waveform periods representative of a first binary digit and a second plurality of cycles of waveform opposite in polarity to said first plurality of cycles of waveform representative of a second binary digit,

means coupled to said means for producing binary coded signals for adding the positive and negative excursions of each plurality of cycles of waveform together to provide, in a given single half waveform period, a combined excursion from said datum having a polarity dependent on the binary digit represented by each plurality of cycles of waveform,



threshold means coupled to the output of said adding means and responsive to the signals therefrom to provide a first signal indicative of one binary digit when said combined excursions exceed a given threshold level in one polarity direction with respect to a datum and to provide a second signal indicative of another binary digit when said combined excursions exceed a given threshold level in the opposite polarity direction with respect to said datum,

and means connected to said threshold means for inhibiting said threshold means for given time intervals between the occurrence of said indicative output signals.

3,271,743
ANALYTIC BOUNDS DETECTOR

John L. Craft, Beacon, and Warren B. Strohm, Hopewell Junction, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Dec. 31, 1962, Ser. No. 248,379
10 Claims. (Cl. 340—172.5)

1. A device for determining the end of an information unit in a sequence of coded data where the end-of-unit symbol in the coded data may have other significance comprising:

first storage means;

input means for applying said coded data sequence to said first storage means;

means for detecting an end-of-unit symbol in the data applied to said storage means;

means responsive to the detection of said end-of-unit symbol for causing said input means to apply a predetermined number of symbols following said end-of-unit symbol in said sequence to said storage means and for then inhibiting further operation of said input means;

second storage means containing in a systematic order, an entry representing each possible form in which an end-of-unit symbol may appear with the symbols before and after it;

means for comparing the symbols stored in said first storage means with the symbols stored in said second storage means,

and means responsive to a match being detected between symbols, including an end-of-unit symbol, in said first storage means and a given entry in said second storage means for indicating the end of an information unit.

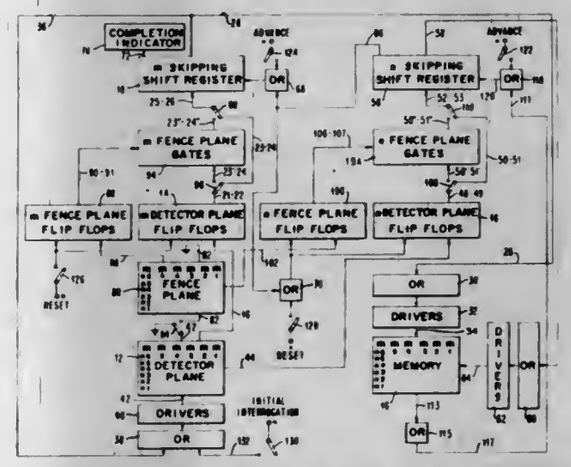
3,271,744
HANDLING OF MULTIPLE MATCHES AND FENCING IN MEMORIES

Harold E. Petersen, Saratoga, Calif., and Michael Teig, Yonkers, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Dec. 31, 1962, Ser. No. 248,595
15 Claims. (Cl. 340—172.5)

1. In a data processing system

a multiple word data memory having n rows and m columns,



a first register having n rows and m columns of register elements corresponding to the n rows and m columns of said memory, one element corresponding to each word of said memory with selected ones of said elements set to a given state,

a second register having m stages corresponding to the m columns of said first register,

a third register having n stages corresponding to the n rows of said first register,

a first skipping shift register having m stages corresponding to the m stages of said second register, operable in response to the setting of stages of said second register for setting corresponding stages of said first skipping shift register, and operable in response to successive interrogation inputs to provide outputs successively from set stages thereof,

a second skipping shift register having n stages corresponding to the n stages of said third register, operable in response to the setting of stages of said third register for setting corresponding stages of said sec-

ond skipping shift register, and operable in response to successive interrogation inputs to provide outputs successively from set stages thereof,

means for simultaneously interrogating all m columns of said first register to set stages of said second and third registers corresponding to said m columns and n rows respectively which have elements set to said given state,

means for applying resetting inputs to said third register,

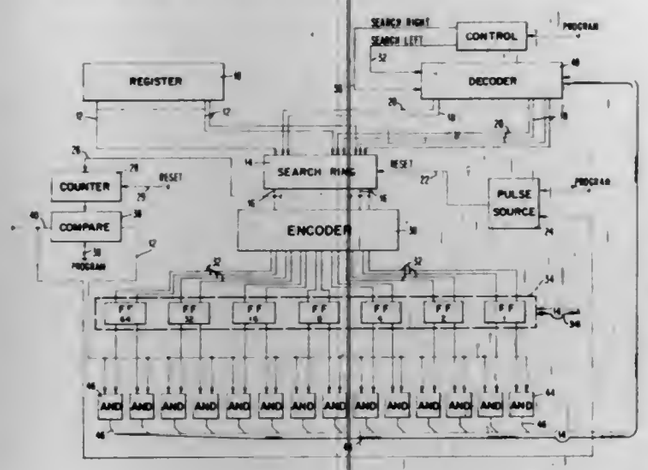
means for applying outputs from said m stages of said first skipping shift register to corresponding columns of said memory and said first register,

means for applying outputs from said n stages of said second skipping shift register to corresponding rows of said memory,

means for applying interrogation inputs to said first skipping shift register,

means for applying interrogation inputs to said second skipping shift register.

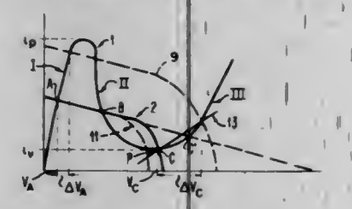
3,271,745
REGISTER SEARCH AND DETECTION SYSTEM



Ralph F. Schauer, Hawthorne, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York

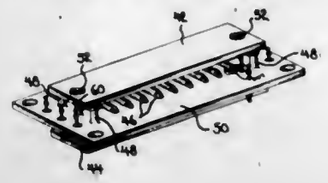
Filed Sept. 20, 1962, Ser. No. 224,966
6 Claims. (Cl. 340—172.5)

1. A multistage circuit for interrogating any selected stage of a multistage register for a bit of information and for continuing the search to succeeding stages of the register until the bit is found, there being a stage in said circuit corresponding to each stage of said register, comprising:



means for interrogating said register to detect the presence of bits in the stages thereof;

means for applying a sampling pulse to said circuit at the stage corresponding to a selected stage of said register;
means responsive to the coincident occurrence of a bit in said selected stage and of said sampling pulse for generating an output signal;



search continuing means normally responsive to the application of said sampling pulse to said circuit stage for applying a sampling pulse to the next succeeding stage of said circuitry in one direction;
and means responsive to the detection of said bit in said selected register stage for inhibiting said search continuing means.

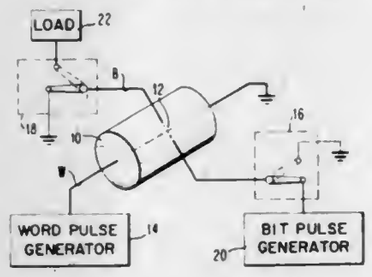
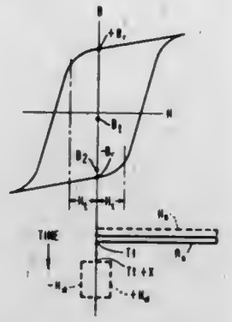
NEGATIVE RESISTANCE MEMORY MATRIX
Jan A. Narud, Scottsdale, Ariz., and Paul E. Stuckert, Katonah, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed July 5, 1962, Ser. No. 207,647
14 Claims. (Cl. 340—173)



1. In a memory array comprising a plurality of bistable memory elements arranged in a coordinate array, each of said memory elements having a current-voltage characteristic having a negative resistance region between a first and a second positive resistance region, said negative resistance region being continuous with said second positive resistance region along a high-resistance valley region, means for selectively switching each of said memory elements between bistable states defined along said characteristic and indicative of binary information, one of said bistable states being defined along that positive resistance region discontinuous with said valley region, sensing means connected along asymmetrical diode devices to predetermined groups of said memory elements, and means including said sensing means for ascertaining the memory state of selected elements in each of said groups, the improvement comprising means for biasing each of said diode devices connected to memory elements operating in the other of said bistable states beyond the knee of its current-voltage characteristic to define said other binary state in said valley region of said characteristic.

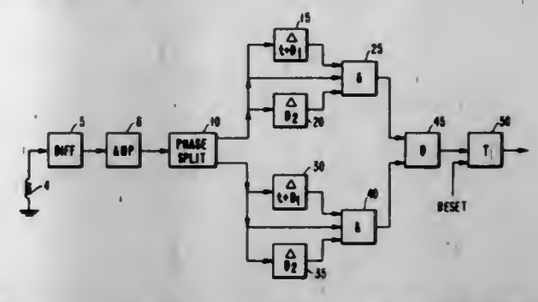
3,271,747
MAGNETIC CORE PACKAGE
Donald R. Harner, Shiremanstown, and Michael Plaxa, Camp Hill, Pa., assignors to AMP Incorporated, Harrisburg, Pa.
Filed Aug. 22, 1961, Ser. No. 133,118
1 Claim. (Cl. 340—174)



In a magnetic core device of the type utilized to store and shift intelligence the combination comprising a core mounting panel, a series of magnetic cores mounted thereon, windings linking said cores including an input and an output winding linking the first and last of said plurality of cores and coupling windings linking adjacent cores to transfer intelligence stored in said cores between cores, at least another panel secured to said first mentioned panel in an overlying protective relationship to said cores, a recirculating loop linking the last core to the first core through the said output and input windings to recirculate intelligence transferred through said register, the said recirculating loop being comprised of flat conductors insulated from each other secured in said other panel to form a flat strip transmission line matched in impedance to the input and output impedance characteristics of the input and output cores and windings whereby to transmit recirculated intelligence with minimum signal loss.

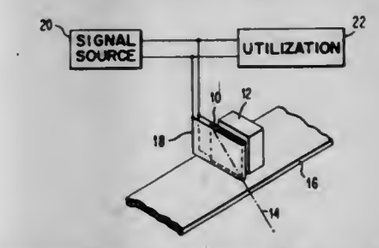
3,271,748
MAGNETIC ELEMENT AND MEMORY
Robert F. Elfant, Yorktown Heights, and Nicholas J. Mazzeo, Peekskill, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Jan. 11, 1963, Ser. No. 250,908
19 Claims. (Cl. 340—174)

8. A magnetic information storage device comprising;
a first conductor;
a second conductor displaced from and in orthogonal relationship with said first conductor;
a magnetic member surrounding said first and second conductors, said member made of material exhibiting different stable states of flux remanence and normally magnetized circumferentially with respect to said first conductor in a datum stable state of remanent flux orientation and distribution with no appreciable remanent flux linkage of said second conductor; and,
means for energizing both said first and second conductors in sequential concurrence to establish said member in a similar stable state of flux orientation but a different remanent state of flux distribution with respect to said datum stable state whereby an appreciable remanent flux linkage of said second conductor is thereafter established.



3,271,749
MAGNETIC STORAGE AND SWITCHING SYSTEM
Norbert G. Vogl, Jr., and John A. Parisi, both of Wappingers Falls, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Oct. 31, 1961, Ser. No. 149,050
2 Claims. (Cl. 340—174)

1. A combinational input switching circuit comprising:
(a) a bistable magnetic core having two limiting remanence states and a plurality of intermediate remanence states and having a static switching threshold associated with each said remanence state which must be exceeded by a magnetizing field before the core can be switched from the said state, said core having the characteristic that a sensitizing field sufficient in magnitude to drive the core from an occupied remanence state but not necessarily sufficient in duration to produce a substantial change of state produces a transistory sensitized condition which exists for a finite time after termination of the sensitizing field and during which the switching threshold is reduced to a minor fraction of the static value to which it returns upon termination of the sensitized condition;
(b) sensitizing means for applying a sensitizing field to said core which is larger in magnitude than the static switching threshold to produce the transitory sensitized condition and to drive the core in a first direction to a new remanence state; and
(c) means effective during existence of said sensitized condition for applying to the core, non-coincidentally with said sensitizing field, a magnetizing field which is opposite in polarity to the sensitizing field and is of a magnitude less than the static switching threshold value to which the core would return upon termination of said sensitized condition but greater than the reduced threshold in existence at the time of application of the pulse so as to drive the core in a direction opposite to said first direction back towards the core's original remanence state.

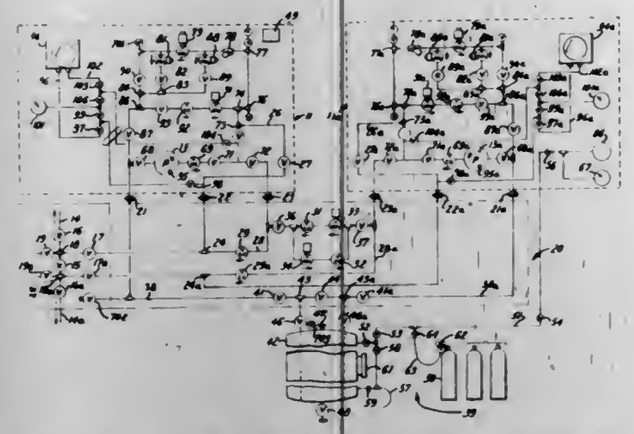


3,271,750
BINARY DATA DETECTING SYSTEM
Marco Padalino, Poughkeepsie, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 13, 1962, Ser. No. 244,355
8 Claims. (Cl. 340—174.1)

1. A reproducing system for binary data recorded on a magnetic medium movable past a transducer, wherein a first predetermined period exists between flux polarity reversals or a second predetermined period exists between flux polarity reversals dependent on the binary data recorded, the second period being half as long as said first period, comprising:
means deriving alternating true and complementary data signals corresponding to the magnetic state of said medium,
means responsive to said true data signal for producing an output pulse indicative of adjacent flux reversals having said first period, the direction of flux reversals having a predetermined sequence,
means responsive to said complementary data signal for producing an output pulse indicative of adjacent

flux reversals having said first period, the direction of flux reversals having a sequence opposite to said predetermined sequence,
and means combining said true and complementary data signal responsive means to produce an output signal indicative of each sequence of flux reversals having said first predetermined period.

3,271,751
MAGNETIC THIN FILM TRANSDUCER
Walter E. Proebster, Chappaqua, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 3, 1962, Ser. No. 241,655
Claims priority, application Switzerland, Dec. 21, 1961, 14,928/61
9 Claims. (Cl. 340—174.1)

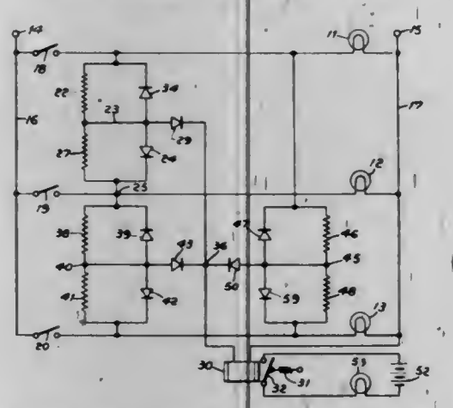


1. In combination with a movable record member having a magnetizable surface, a transducer comprising,
a plane anisotropic thin magnetic film element having an easy axis of remanent flux orientation defining opposite stable states,
said film having at least one edge in close proximity to the surface of said record member with the easy axis being angularly displaced from said one edge, and
a control winding coupling said film.

3,271,752
PIPE-TYPE CABLE CONTROLLER COMPRISING SELF-TESTING FEATURES
John L. Lansch, Nyack, N.Y., assignor, by mesne assignments, to Anaconda Wire and Cable Company, a corporation of Delaware
Original application July 25, 1960, Ser. No. 45,115, now Patent No. 3,155,765, dated Nov. 3, 1964. Divided and this application Oct. 1, 1964, Ser. No. 414,042
3 Claims. (Cl. 340—214)

1. Apparatus for controlling the oil pressure in an electric cable comprising an A.-C. bus, a D.-C. bus, a plurality of magnetic relays energizable across said D.-C. bus, sensing means for sensing the conditions of said cable, said relays being responsive to said sensing means, a plurality of signal lamps energizable across said A.-C. bus by means of said relays, electric circuitry associated with each of said relays, at least one receptacle comprising a

plurality of contacts, two of said contacts being electrically connected across said A.-C. bus, another two of said contacts being electrically connected across said D.-C. bus, a plurality of said contacts each being electrically connected to one of said relays, testing means comprising an A.-C. voltmeter connected to engage the contacts across said A.-C. bus, a D.-C. voltmeter con-



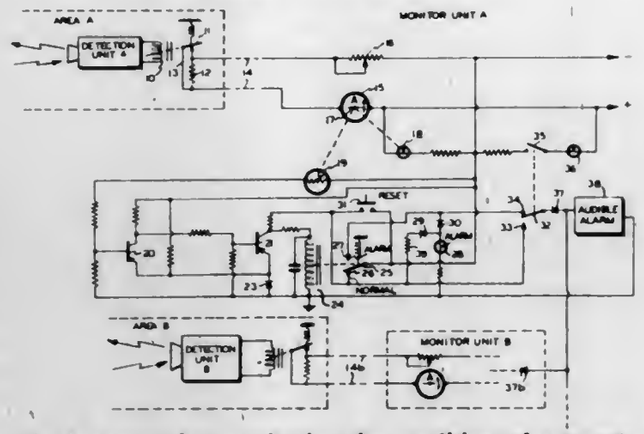
nected to engage the contacts across said D.-C. bus, and switching means for energizing each of said relays and its associated circuitry across said D.-C. bus, whereby the voltage across said A.-C. bus and the voltage across said D.-C. bus may be tested and each of said relays and its associated circuitry may be tested without being removed from said apparatus.

3,271,753

MONITORING CIRCUIT FOR DETECTING CONVERGENCE OF A PLURALITY OF VOLTAGE LEVELS

Rudolf Luce, Ditzingen, Wurttemberg, Germany, assignor to International Standard Electric Corporation, New York, N.Y., a corporation of New York

Filed Aug. 19, 1963, Ser. No. 302,790
Claims priority, application Germany, Aug. 30, 1962, St 19,650
15 Claims. (Cl. 340—248)



1. A monitoring system comprising a first voltage source, a second voltage source, a plurality of loads, a first terminal of a first one of said loads being connected through switching means to said first voltage source, a second terminal of said first one of said loads being connected to said second voltage source, a first terminal of a second one of said loads being connected through switching means to said first voltage source, a second terminal of said second one of said loads being connected to said second voltage source, and a conductive path from said first terminal of said first load to said second voltage source, said conductive path comprising an impedance in series with a parallel combination of branches, a first one of said branches including first current-control means in series with a utilization device, and a second one of said branches including second current-control means connected to said first terminal of said second one of said loads, said second current control means being shunted by an impedance.

3,271,754

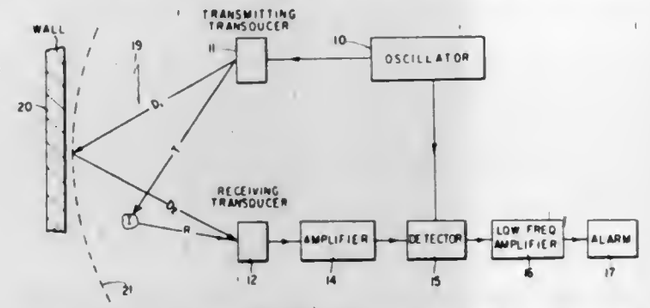
MONITORING SYSTEM

Paul I. Corbell, Rockville, Md., assignor to Johnson Service Company, Milwaukee, Wis., a corporation of Wisconsin

Filed July 9, 1963, Ser. No. 293,649
5 Claims. (Cl. 340—258)

1. A system for monitoring the condition of a remote station, comprising a monitoring unit, a line circuit connecting said unit with said station, said unit comprising an electrical meter connected to said line circuit and having a movable member responsive to the current-voltage parameter of said line circuit, a light reflective element associated with said member and movable in response to said member, a light source illuminating said element, photoresponsive means optically coupled to said element, means for adjusting the optical coupling between said element and said photoresponsive means to a desired condition, a bistable circuit electrically coupled to said photoresponsive means, means biasing said bistable circuit to a first state when a given optical coupling is obtained between said photoresponsive means and said element and biasing said bistable circuit to a second state when a lesser optical coupling is obtained, a relay controlled by said bistable circuit to be relatively energized when said bistable circuit is in said first state and relatively deenergized when said bistable circuit is in said second state, a switch biased to a first position and controlled by said relay to be moved to a second position against its bias when said relay is relatively energized, a holding circuit associated with said switch for controlling the application of current to said relay to maintain said relay deenergized once said switch is moved to said first position, reset means for bypassing said holding circuit to permit the application of current to said relay and the resetting of said switch thereby, and indicator means controlled by said switch and activated when said switch is in said first position.

3,271,755



DOPPLER TYPE INTRUDER DETECTION SYSTEM ARRANGED TO ELIMINATE EXTRANEOUS AIR TURBULENCE EFFECTS

Samuel M. Bagno, Belleville, N.J., assignor to Specialties Development Corporation, Belleville, N.J., a corporation of New York

Filed Mar. 16, 1964, Ser. No. 352,215
1 Claim. (Cl. 340—258)

Apparatus insensitive to air turbulence for detecting the motion of an intruder within an inner portion of an area at least partially bounded by reflective objects, said inner portion being defined by a predetermined perimeter lying inwardly of said reflective objects, said apparatus includ-

ing means for producing ultrasonic energy at a given high frequency of at least about 40,000 cycles per second, transducer means for radiating the ultrasonic energy from a point within said inner portion of said area, transducer means for receiving only reflected ultrasonic energy at a point within said inner portion of said area, said receiving transducer means being positioned with respect to said radiating transducer means to prevent a direct line of transmission of ultrasonic energy through air from said radiating transducer means to said receiving transducer means, means for comparing the frequency of the radiated and reflected energy and for detecting any difference in frequency between the radiated energy and reflected energy having an amplitude at least equal to a predetermined percentage of the amplitude of the radiated energy, said radiating and receiving transducers being located with

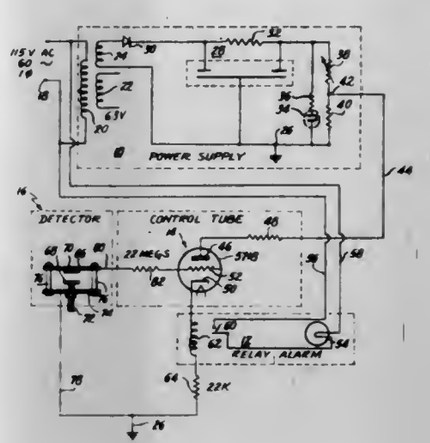
respect to any point of said perimeter at fixed distances determined by the frequency of the radiated energy according to the relationship $A=e^{-Rfs}$ so that radiated energy reflected from a point beyond said perimeter is attenuated by the air to an amplitude less than said predetermined percentage of the radiated energy amplitude, in said relationship A being the minimum permissible ratio of received energy amplitude to radiated energy amplitude to produce a detectable signal at said receiving transducer, e being the base of natural logarithms, R being a constant dependent upon the viscosity and density of the air and the velocity of sound through the air, f being the frequency of the radiated energy, and S being the sum of the distances from any point on said perimeter to said transducers, whereby said apparatus is insensitive to radiated energy which is changed in frequency by passage through moving air within said perimeter and is reflected from a point beyond said perimeter.

3,271,756

METHOD AND APPARATUS FOR DETECTING A HAZARDOUS CONDITION

Robert B. P. Crawford, Rosemead, Calif., and Donese B. Tackett, Scottsdale, Ariz., assignors to Harold J. Burke, Lake Forest, Ill.

Filed Mar. 22, 1960, Ser. No. 16,827
8 Claims. (Cl. 340—237)



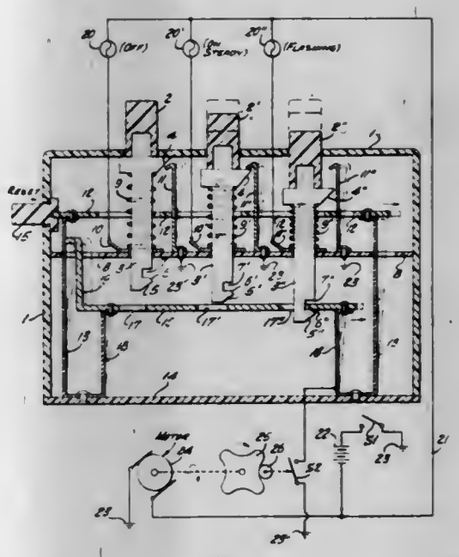
1. A hazardous condition detector comprising:

a pair of charged particle collectors separated to define a space open to the atmosphere of a selected environment,

a source of charged particle emitting material positioned in said space closer to one than the other of said pair of charged particle collectors to produce a greater electrical potential on said one of said pair of charged particle collectors and a smaller electrical potential on said other of said pair of charged particle collectors,

said pair of particle collectors being charged only by the source of charged particle emitting material and being the sole biasing potential for an electron discharge device to enable the relative difference between said greater electrical potential and said smaller electrical potential to be dependent upon the environmental atmosphere in said space,

electrical potential dissipating means operatively associated with said pair of charged particle collectors whereby under normal environmental conditions the relative electrical potentials on said pair of charged particle collectors will remain substantially constant and rapid variations in the environmental atmosphere in said space will modify the relative electrical potentials on said pair of charge particle collectors, and



means for connecting the pair of charged particle collectors to the electron discharge device to enable said biasing potential to provide a cut-off bias to the discharge device under normal environmental conditions and to provide less than a cut-off bias thereto under rapidly changing environmental conditions and cause said electron discharge device to conduct and signal an alarm.

3,271,757

MULTI POSITION MANUAL LATCHING SWITCH FOR INDICATING LAST ENTRY

Nathaniel B. Wales, Jr., 66 E. 80th St., New York, N.Y.

Filed Sept. 24, 1965, Ser. No. 489,979
2 Claims. (Cl. 340—332)

1. A multiple position last entry indicating latching switch structure comprising:

a frame;

a plurality of switch operator members each moveably secured to said frame, and each being manually moveable to three sequential positions, namely "off," "on one," and "on two" in that sequential order;

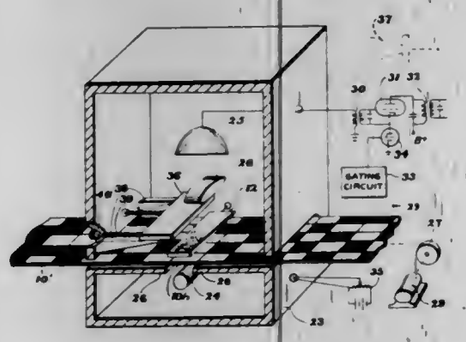
spring means for each said switch operator members urging it into said "off" position from either said "on one" or "on two" position by supplying a force between said frame and said operator;

a first latch means for each said operator secured to said frame and adapted to latch said operator in said "on one" position;

a second latch means for each said operator secured to said frame, and adapted to latch said operator in said "on two" position;

a first electric switch for each said operator secured to said frame, and adapted for actuation by the positioning of its said switch operator member in its said "on one" position;

a second electric switch for each said operator secured to said frame, and adapted for operation by the positioning of its said switch operator member in its "on two" position;



cam means mounted on and moveable with respect to said frame responsive to the positionment of any said operator to said "on two" position to unlatch any other said operator previously positioned in said "on two" position, whereby to return said previously positioned operator by said spring means to said "on one" position; and

a reset actuator moveable with respect to said frame to disengage all said first and second latching means, whereby to return all said switch operators to the said "off" position under the urging of said spring means.

3,271,758
INFORMATION CONVERTER ARRANGEMENT

Keith F. Stultz, Rochester, N.Y., and Hans J. Zweig, Mountain View, Calif., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

Filed July 24, 1963, Ser. No. 297,262
12 Claims. (Cl. 340—347)

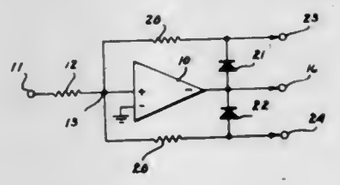
4. A digit-to-analog converter for deriving the analog value of a multi-digit number of radix R recorded on a record member with each digit of the number recorded in a separate discrete area, the relative position and light-absorption characteristics of each such area indicating respectively the digit-order and the ordinal value of the corresponding digit, said converter comprising:

a source of illumination,

light-flux sensing means,

means for directing light flux from said source along a predetermined path toward said sensing means,

digit-value weighting means interposed in said path and including a plurality of distinct light-transmitting portions, one corresponding to each digit of said recorded number,



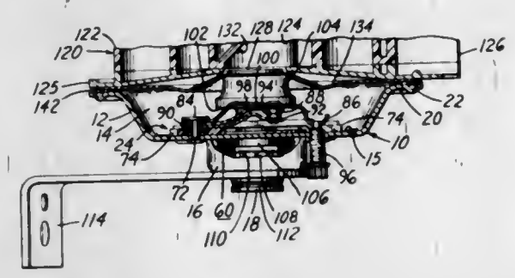
the light-transmitting characteristics of said portions being related to the orders of the digits and the radix of said number so that under equal conditions of illumination the light flux transmitted towards said sensing means by that portion corresponding to any particular-order digit will be R-times greater than that transmitted by the portion corresponding to the next-lower-order digit,

and means for positioning said record member in said path so that the passage of light flux to said sensing means by way of any one of said portions will be controlled by the corresponding discrete digit area of said record member.

3,271,759
ANALOG TO DIGITAL CONVERTER

Bill Hopper, Phoenix, Ariz., assignor to Dynamic System Electronics Corp.

Filed Sept. 13, 1963, Ser. No. 308,705
4 Claims. (Cl. 340—347)

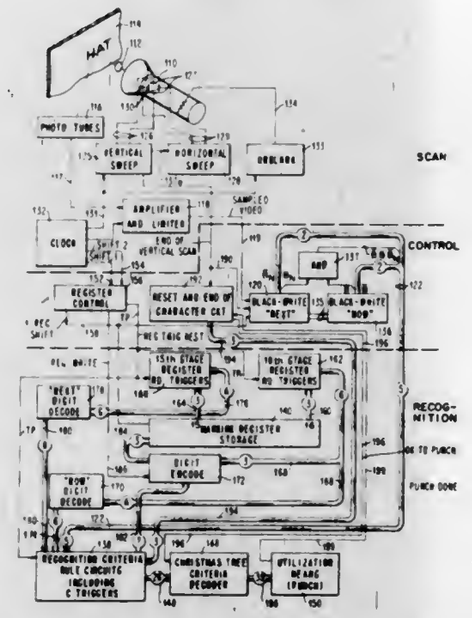


1. In an analog to digital converter comprising: a plurality of summing amplifiers each representing a binary digit of a reflected binary code and each including an input, an output, and a feedback path; means connecting an analog voltage, to be converted to digital representation, to the input of each of said amplifiers; means connecting the feedback path of each amplifier to the input of all other amplifiers representing a less significant digit; and a plurality of zero cross-over detectors, each connected to the output of one of said amplifiers respectively, for providing an indication of polarity of the output signal provided by the corresponding amplifier, and thus the digital value of the output of the corresponding amplifiers.

3,271,760
ELECTROMAGNETIC DIAPHRAGM HORN

Clark E. Sloan, Jr., Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed July 13, 1962, Ser. No. 209,608
9 Claims. (Cl. 340—388)



1. An electromagnetic horn comprising, a sound projector, a diaphragm cooperating with said sound projector, a metal housing supporting said sound projector and diaphragm, an electromagnet including a coil winding and an armature, said armature recirprocating said diaphragm, switch contacts for controlling the energization of said coil winding operated by said armature, and a unitary coil winding assembly having a spool supporting said coil winding, said coil winding assembly including insulating portion means integral with the spool to support at least one of said switch contacts and position said coil winding assembly on said metal housing and insulated from said metal housing.

3,271,761
CURVATURE AND SHAPE DETECTION

Kuang-Chi Hu, Hartsdale, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Nov. 29, 1963, Ser. No. 326,763
12 Claims. (Cl. 340—146.3)

6. In a system for recognizing two-dimensional patterns, an apparatus for determining the shape of a pattern-defined background region comprising, in combination:

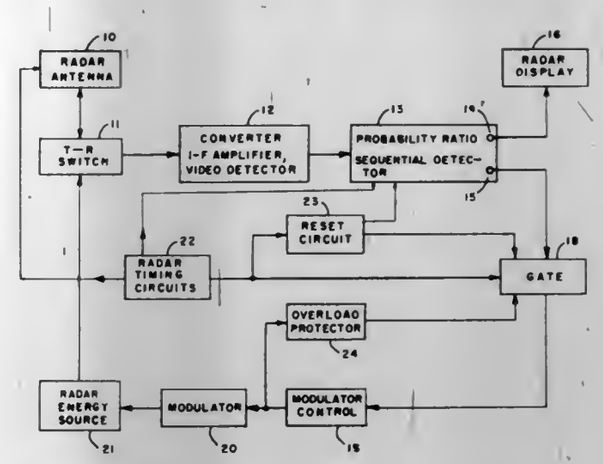
means for providing an indication of the maximum height of the region;

means for providing an indication of the maximum width of the region;

means responsive to the maximum height and maximum width indications for providing an indication of the product of the maximum height and maximum width;

means responsive to the product indication for providing an indication of a predetermined fraction of the product, where the fraction exceeds one-half and is less than one;

means for providing an indication of the area of the region;



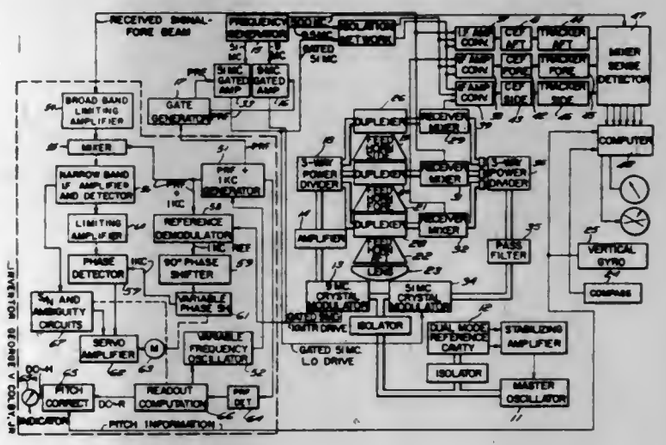
and means responsive to the area indication and the indication of the predetermined fraction of the product, for providing an indication of the larger of these indications, whereby the region is determined to be relatively rectangular when the area indication exceeds the indication of the fraction of the product, and whereby the region is determined to be relatively triangular when the indication of the fraction of the product exceeds the area indication.

3,271,762
ELECTRICAL SYSTEM

Kenneth K. Zelger, Levittown, Pa., assignor to General Atronics Corporation, Wyndmoor, Pa., a corporation of Pennsylvania

Filed June 26, 1963, Ser. No. 290,832
14 Claims. (Cl. 343—7)

1. In a radar system having means for transmitting plural radar pulses at a given effective antenna orientation: probability ratio sequential detector means; means for supplying the returns from each said pulse to said detector means; means for deriving from said detector means a signal indicative of the classification of all said returns at one given orientation as target and no-target



returns; means responsive to said derived signal to terminate the transmission of said pulses and means for restarting said transmission upon assumption by said antenna of another effective orientation.

3,271,763
RADAR ALTIMETER

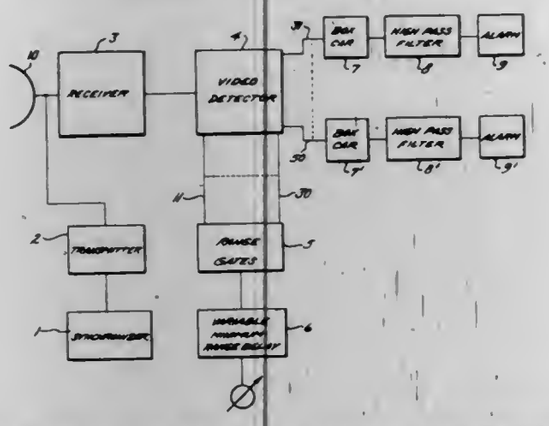
George V. Colby, Jr., Lexington, Mass., assignor to Laboratory for Electronics, Inc., Boston, Mass., a corporation of Delaware

Filed Feb. 25, 1964, Ser. No. 347,290
12 Claims. (Cl. 343—7)

2. A terrain clearance indicator for aircraft comprising:

(a) means including an antenna to produce interrupted continuous waves of electromagnetic energy and to transmit a beam of said waves towards the earth,

(b) receiving means including said antenna to receive echoes of said waves reflected from the earth; phase sensing means connected to said receiving means to generate an output signal as a function of the phase relation between the envelopes of the transmitted wave and the received wave,



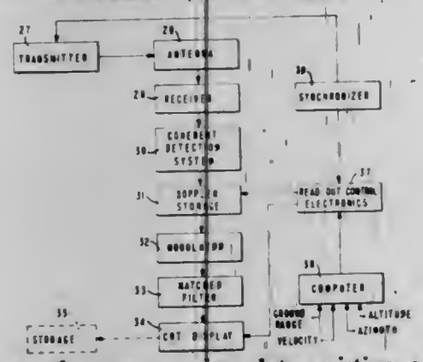
(c) means responsive to said output signal to vary the frequency at which said waves are interrupted so as to produce a predetermined phase relation between the envelopes of the transmitted and received waves,

(d) and means to provide an indication of terrain clearance as a function of the frequency of interruption of said waves.

3,271,764
RADAR TORNADO ALARM

David Atlas, Newton, and Roger M. Lhermitte, Sudbury, Mass.; said Atlas assignor to the United States of America as represented by the Secretary of the Air Force

Filed Apr. 24, 1964, Ser. No. 362,533
7 Claims. (Cl. 343—11)



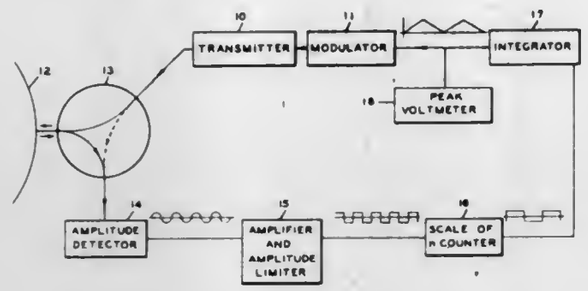
1. A radar tornado detection and alarm system wherein radar pulse returns from said tornado fluctuate in frequency determined by the velocity characteristics of the tornado comprising means for directing radiant energy in the form of pulses toward the region of said tornado, said directed pulses having a repetition frequency larger in magnitude than said fluctuating frequency, means to receive return pulses from said tornado and said region, means to detect said return pulses at preselected range intervals, means to select from said detected pulses only signals exclusively representative of said tornado at the corresponding range interval thereof, said selecting means including a series combination of a boxcar circuit and a high pass filter with said filter passing signals having frequencies exceeding two thousand cycles per second.

3,271,765
DATA COMPRESSION PROCESSING SYSTEM

Samuel R. Pulford, Owego, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Dec. 19, 1963, Ser. No. 331,732
9 Claims. (Cl. 343—12)

1. A system for compressing data existing as plural sets of data signals, said signal sets being adapted to have different predetermined frequency versus time characteristics,



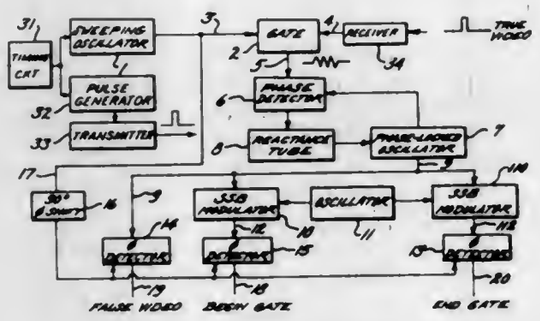
means for converting said data signal sets to respective output signal sets, each of said output signal sets having substantially the same predetermined frequency versus time characteristic, and

matched filtering means responsive to said output signal sets to provide a compressed output signal in response to each of said output signal sets, said matched filtering means having a frequency versus time response characteristic compatible to the frequency versus time characteristic of said output signal sets.

3,271,766
CONTINUOUS WAVE FM RADAR

Ole K. Nilssen, Livonia, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware

Filed May 4, 1964, Ser. No. 364,515
9 Claims. (Cl. 343—14)



1. A continuous wave radar system for determining range between the system and a target comprising, a transmitting means, modulating means coupled to said transmitting means for frequency modulating said transmitting means, means for receiving and combining a signal transmitted by said transmitting means and a signal reflected from the target, means coupled to said last mentioned means for producing a beat frequency signal that varies as a function of the range between the system and the target and having a frequency equal to the difference between the transmitted signal and the received signal, and means coupled to said last mentioned means and said modulating means for modifying the rate of change of said transmitting means each time a given number of beat cycles is produced, and means connected in circuit with said last mentioned means and said modulating means for determining the frequency swing of said transmitting means required for said given number of said beat cycles whereby range between the system and the target may be determined.

3,271,767
RADAR TRACKING

Norbert D. Larky, Rialto, Calif., assignor to the United States of America as represented by the Secretary of the Air Force

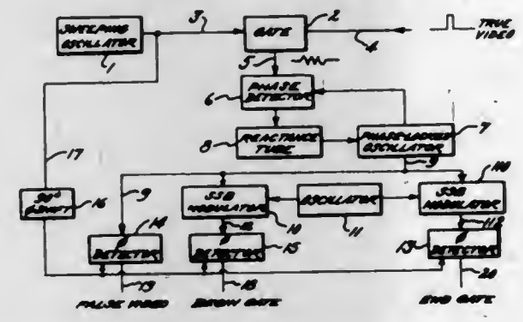
Filed Nov. 5, 1963, Ser. No. 321,654
7 Claims. (Cl. 343—17.1)

1. A radar apparatus for converting a true reflected video target pulse into a false video pulse comprising:

(a) means for transmitting a signal pulse;

(b) a sweeping oscillator synchronized with the transmitting means;

(c) means for receiving a true video pulse reflected from the target;



(d) means for generating a continuous signal having a frequency equal to that of the sweeping oscillator at the time of reception of the true video pulse;

(e) and means for producing a false video pulse, the time of occurrence thereof being indicative of target range, the pulse-producing means being fed by the continuous signal generating means and the sweeping oscillator.

3,271,768
RADAR TRACKING SYSTEM

Norbert D. Larky, Rialto, Calif., assignor to the United States of America as represented by the Secretary of the Air Force

Filed Apr. 17, 1964, Ser. No. 360,785
2 Claims. (Cl. 343—17.1)

1. A multiple PRF radar system comprising:

(a) a sweeping oscillator;

(b) means for transmitting a repeating sequence of pulses with each pulse having a continually higher frequency dependent upon the instantaneous frequency of the sweeping oscillator at the time of transmitting;

(c) means for receiving the echoed true video pulses;

(d) a plurality of delay lines connected to the sweeping oscillator;

(e) a plurality of frequency gates connected to the delay lines;

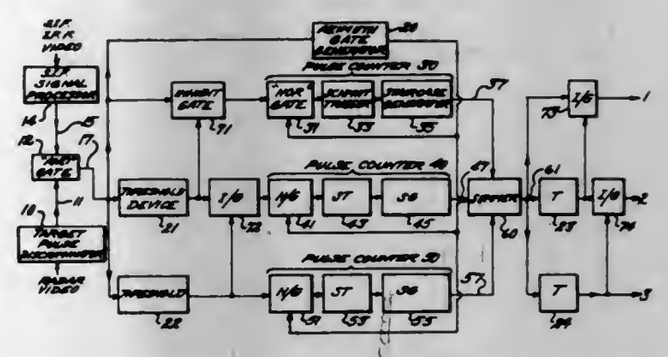
(f) a plurality of echo gates connected to the receiving means with each of the echo gates connected to one of the frequency gates wherein only one gate at a time will produce an output pulse frequency dependent upon target range;

(g) a means for generating a continuous signal having a frequency equal to the output frequency of the activated echo gate, the continuous signal generating means including a first phase detector fed by one of the echo gates, a reactance tube fed by the first phase detector, a phase locked oscillator controlled by the reactance tube and connected to the first phase detector, with the first phase detector, the reactance tube, and the phase locked oscillator forming a looped circuit;

(h) a fixed frequency oscillator;

(i) a first single sideband modulator fed by the fixed frequency oscillator and the phase locked oscillator and having a frequency output lower than the frequency of the input pulse by an amount equal to the frequency of the fixed frequency oscillator, the output being used to control the frequency gates and to control activation of the receiving means;

(j) a second single sideband modulator fed by the fixed frequency oscillator and one of the echo gates and having a frequency output higher than the frequency of the input pulse by an amount equal to the frequency of the fixed frequency oscillator, the output being used to control the frequency gates and to control deactivation of the receiving means;



(k) a phase shifter connected to the sweeping oscillator;

(l) and a second phase detector fed by the phase shifter and one of the echo gates for producing an output indicative of range.

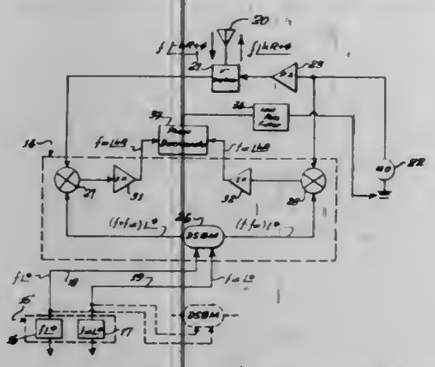
3,271,769
RADAR VIDEO PULSE TO PULSE WEIGHTING APPARATUS

Gilmore H. Trafford, Lexington, Mass., and George B. Michel, Baltimore, Md., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Air Force

Filed Jan. 14, 1965, Ser. No. 425,647
3 Claims. (Cl. 343—17.1)

1. In scanning radar system comprising an antenna and receiver for receiving echo pulses from a target, means for automatically segregating each of said received echo pulses into one of three predetermined grades of signal levels comprising: pulse discriminator means connected to the output of said receiver, target selectivity gate means to which the output from said pulse discriminator means is applied, range and azimuth signal processor means associated with said scanning radar system having an output connected to said target selectivity gate means, said gate means being enabled only when said pulse discriminator output and said signal processor output are simultaneously energized, first, second and third pulse counter means to which the output from said gate means is applied, azimuth gate generator means to which the output from said gate means is applied, said azimuth gate having a width determined by the azimuth scan rate and antenna beamwidth of said scanning radar system, means electrically interposed between the input of each of said pulse counter means and the output of said target selectivity gate means to separate each target pulse return into three different amplitude levels, each of said pulse counters comprising adjustable voltage step generating means for weighting each of said target echo pulses on a pulse to pulse basis over the antenna beamwidth, each of said voltage step generating means having a different signal amplitude from the other, voltage summing means to which the output from each of said pulse counter means is connected, and pulse signal classifying means connected to the output of said summing means comprising first and second threshold means connected in parallel to segregate said summing means output into one of three predetermined output levels.

3,271,770
ANTENNA PHASING CONTROL SYSTEM



Alan B. Lees, Canoga Park, Calif., assignor to Electronic Specialty Co., Los Angeles, Calif., a corporation of California

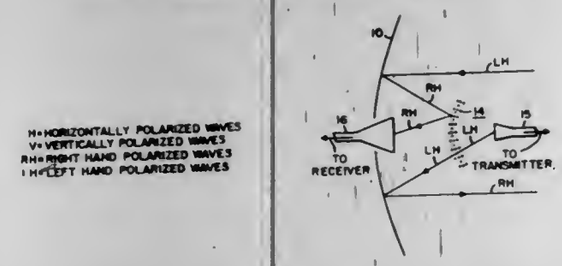
Filed July 8, 1963, Ser. No. 293,328
7 Claims. (Cl. 343—100)

1. In radio-frequency communication apparatus including an antenna coupled to means for transmitting and receiving radio-frequency signals, said apparatus including a system for maintaining radio-frequency signals radiated by said antenna in a predetermined phase relationship with a radio-frequency signal received by said antenna, said system comprising, in combination:

(a) means for generating radio-frequency signals coupled to said antenna;

(b) intermediate-frequency signal component producing means coupled to said antenna for heterodyning said received signal with a signal of a predetermined fixed phase and a frequency which is the sum of the received signal frequency and a predetermined intermediate frequency to thereby produce an intermediate-frequency first signal component, and for heterodyning the output of said means for generating radio-frequency signals with a signal of said predetermined fixed phase and a frequency which is the difference between said received signal frequency and said predetermined intermediate frequency to

thereby produce an intermediate-frequency second signal component, and,



(c) phasing control means intercoupling said intermediate-frequency signal component producing means and said means for generating radio-frequency signals to alter the phasing of the signals generated by said last-mentioned means in accordance with differences in phase between said intermediate-frequency first and second signal components produced by said signal component producing means to maintain the signals radiated by said antenna in said predetermined phase relationship with said received radio-frequency signal.

3,271,771

DOUBLE-REFLECTOR, DOUBLE-FEED ANTENNA FOR CROSSED POLARIZATIONS AND POLARIZATION CHANGING DEVICES USEFUL THEREIN

Peter W. Hannan, Northport, and Harold A. Wheeler, Great Neck, N.Y., assignors to Hazeltine Research Inc., a corporation of Illinois

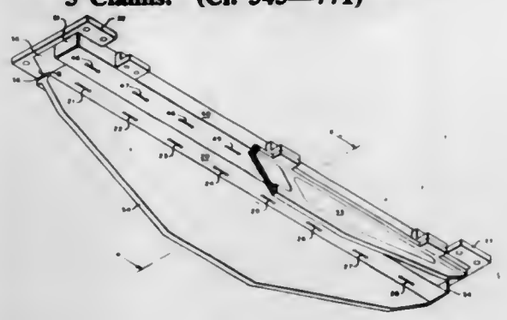
Filed Feb. 15, 1962, Ser. No. 173,501
13 Claims. (Cl. 343—756)

1. A double-reflector double-feed antenna for radiating signals of a first circular polarization and receiving return signals which have undergone circular polarization reversing action in reflection from an object comprising:

a main reflector;

subreflector means cooperating with said main reflector which is substantially transparent for waves of a first circular polarization and which reflects waves of the opposite circular polarization;

a first feed for waves of said first polarization cooperating with said main reflector substantially independently of said subreflector means;



and a second feed for waves of said opposite polarization cooperating with the combination of said main reflector and subreflector means.

3,271,772

SLOT ANTENNA ARRAY WITH SIDE REFLECTORS

Emile J. Deveau and John C. Rolfs, Pleasantville, and Humbert P. Rossero, Peekskill, N.Y., assignors to General Precision, Inc., a corporation of Delaware

Filed Dec. 6, 1962, Ser. No. 242,665
5 Claims. (Cl. 343—771)

2. An antenna, comprising,

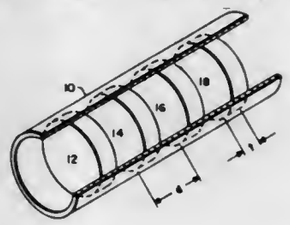
two identical linear arrays,

each of said arrays comprising a rectangular waveguide having a plurality of longitudinal slots formed in one broad face,

all of said slots being formed on the same side of the center line of said broad face,

said waveguides being positioned side by side but with one waveguide turned end for end with respect to the other, and

two planar conductive reflectors positioned to that side of each waveguide which is remote from the other waveguide,



said reflectors being angled outwardly with respect to each other.

3,271,773

MODE-SEPARATION CIRCULAR WAVEGUIDE AND ANTENNAS USING SAME

Harold A. Wheeler, Great Neck, N.Y., assignor to Hazeltine Research Inc., a corporation of Illinois

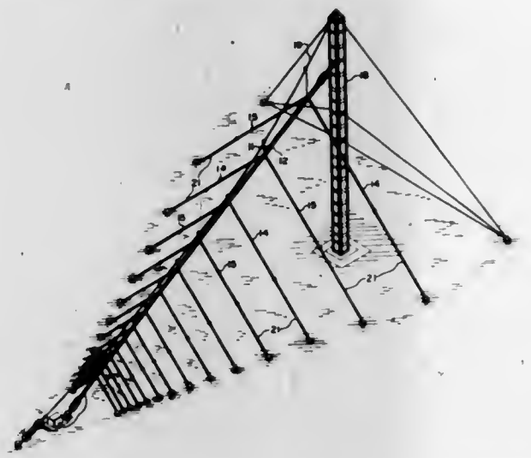
Filed Jan. 22, 1964, Ser. No. 339,408
10 Claims. (Cl. 343—778)

1. A mode-separation waveguide for propagating energy in a predetermined frequency range in a single mode comprising:

coupling means for supplying a signal in a predetermined frequency range;

a hollow cylindrical member having a conductive inner surface for propagating said supplied signal in a circularly polarized wave and having a cross-section which permits propagation of the dominant mode and cuts off all other modes;

and a dielectric medium inside said cylinder comprising transverse regions having a first dielectrc constant separated by transverse regions having a lower dielectric constant arranged so that the effective dielectric constant for transverse electric field components is higher than the effective dielectric constant for axial electric field components by a predetermined factor;



the waveguide being so constructed and arranged that only the dominant mode is propagated and there is increased separation between the cutoff frequencies of the dominant mode and the second mode, as compared to the separation in a circular waveguide completely filled with any homogeneous dielectric.

3,271,774

CATENARY SUPPORTED LOG PERIODIC ANTENNA

Raymond Justice, Lake Barcroft, Falls Church, Va., assignor to Granger Associates, Palo Alto, Calif., a corporation of California

Filed Oct. 17, 1962, Ser. No. 231,200
3 Claims. (Cl. 343—792.5)

1. A log periodic antenna structure comprising, two logarithmically periodic arrays having a common apex substantially at ground level, each of said arrays comprising an electrically conducting feed wire inclined upwardly and away from said apex, a single tower supporting the outer ends of said feed wires, the two feed wires of said arrays lying in a common vertical plane, mutually spaced, electrically conducting, linear radiating elements extending alternately to one side and then to the other side from each of said feed wires, said linear radiating elements of each of said arrays increasing progressively in length from the apex of the array going towards the supporting tower substantially in accordance with the relationship

$$\frac{L_n+1}{L_n}=\frac{X_n+1}{X_n}=\sigma$$

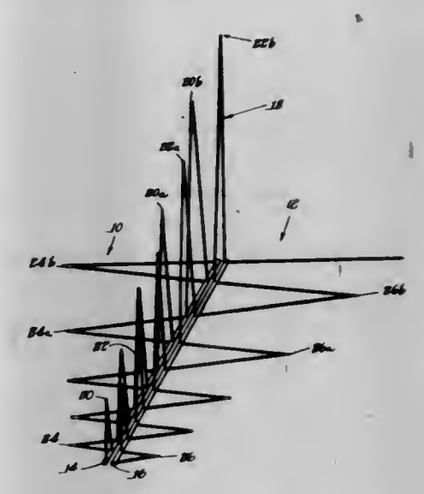
where L_n and L_n+1 are the lengths of the nth element and the element in front of the nth element respectively and X_n and X_n+1 are the distances of the same two radiating elements from the apex of the arrays, and σ is less than 1, the elements extending from the feed wires in such directions that angle θ_n is different from 90° where θ_n is the angle between the nth element and the vertical plane containing both said feed wires and to either side of which said radiating elements extend, said radiating elements inclining downwardly to either side of the feed wires and insulating means connecting their outer ends to the ground.

3,271,775

VERTICALLY POLARIZED LOG-PERIODIC ANTENNA

Richard F. H. Yang, Orland Park, Ill., assignor to Andrew Corporation, Orland Park, Ill., a corporation of Illinois

Filed July 25, 1963, Ser. No. 297,647
7 Claims. (Cl. 343—792.5)



1. A log-periodic antenna having:

(a) an open-wire transmission-line pair,

(b) vertically disposed conductor elements of log-periodic dimensions and spacing extending upward along the transmission-line pair,

(c) alternate upwardly extending conductor elements being connected to respective members of the transmission line and said upwardly extending elements being the sole vertically disposed elements,

(d) and conductor elements of log-periodic dimensions and spacing each extending in only one at least partially horizontal direction from the transmission-line pair, the horizontal component of said outward extension of successive elements being alternated in direction,

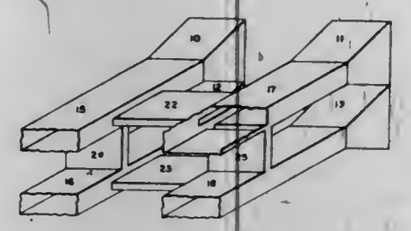
(e) the latter conductor elements each being connected to the transmission-line member opposite that to which the vertically disposed conductor element in the corresponding position along the transmission line is connected.

7. In combination with an antenna of the type having a pair of conductors extending along its length and forming an open-wire balanced transmission line, and radiating elements spaced along the line and connected to the respective members of the pair, additional conductors extending parallel with the transmission line pair and means at each point of connection of a member to the radiating elements to selectively connect and disconnect one of the additional conductors and one of the members of the pair to alter the impedance of the antenna.

3,271,776

INTERCOUPLING LINES FOR IMPEDANCE MATCHING OF ARRAY ANTENNAS

Peter W. Hannan, Northport, N.Y., assignor to Hazeltine Research Inc., a corporation of Illinois

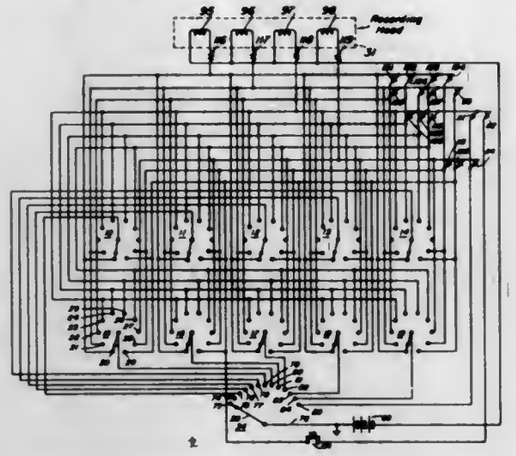


Filed Dec. 28, 1962, Ser. No. 248,074
12 Claims. (Cl. 343—777)

1. An array antenna having closer impedance matching, comprising:

a plurality of radiating elements;

branch transmission lines connecting to said radiating elements;



means for exciting said elements through said lines in a plurality of conditions;
and means, substantially independent of the function of said exciting means, for intercoupling said branch

transmission lines so as to provide an effect on impedance which is dependent on differences of excitation between radiating elements so that closer impedance matching results for at least one condition of excitation.

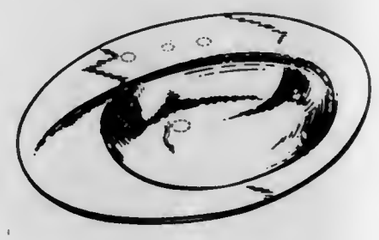
3,271,777
MAGNETIC DIGITAL RECORDER
John R. Davis, Shreveport, La., assignor to United Gas Corporation, a corporation of Delaware
Filed Nov. 15, 1961, Ser. No. 152,452
12 Claims. (Cl. 346—74)

10. A magnetic digital recorder comprising a multichannel recording head, a plurality of symbol switches, each symbol switch having a plurality of contacts corresponding to selected information symbols and being operable to a plurality of positions for closing circuits through said contacts, means including a diode matrix for connecting said contacts of said symbol switches to one or more selected channels of said recording head in accordance with the symbol represented by the respective contact of each respective switch and for preventing energization of other channels, read-out means for sequentially energizing said symbol switches for recording a complete word, said read-out means comprising means for advancing a magnetizable member a substantially predetermined step across said recording head for each recording and for concurrently respectively providing said energization of each symbol switch for a portion of each step of the magnetizable member for each recording whereby the selected channel or channels of said recording head are respectively energized and the recording on the magnetiz-

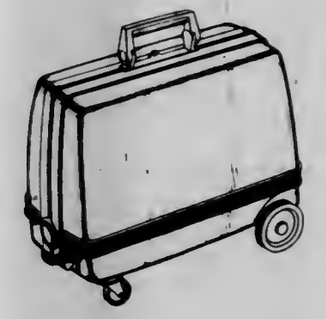
able member corresponds to the symbol represented by the position of the energized symbol switch, said read-out means providing for energization of channels of said recording head for recording a zero symbol at the start of each new word independently of said symbol switches and through said diode matrix, and means for recording an error symbol in lieu of said zero symbol at the start of a word whereby the last previous recorded word will be disregarded by a computer and the ensuing word substituted therefor.

DESIGNS

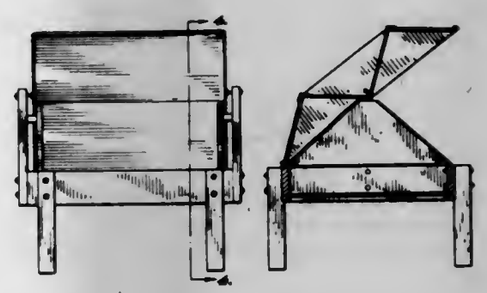
SEPTEMBER 6, 1966



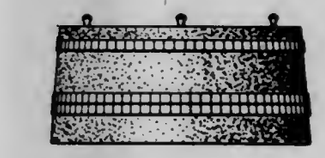
205,651
HAT OR SIMILAR ARTICLE
Bernhardt Stahmer, 1509 Chicago St., Omaha, Nebr.
Substituted for abandoned design application Ser. No. 74,430, Aug. 21, 1964. This application Aug. 20, 1964, Ser. No. 81,402
Term of patent 14 years
(Cl. D3—13)



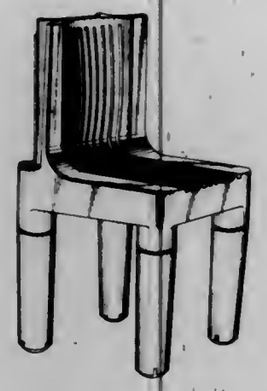
205,652
SAFETY HELMET
Brock F. Brockway, Mill Valley, Calif., assignor to E. D. Bullard Company, Sausalito, Calif., a corporation of California
Filed Dec. 4, 1964, Ser. No. 82,908
Term of patent 14 years
(Cl. D3—13)



205,653
LAVATORY
James E. Niemann, Louisville, Ky., assignor to American Radiator & Standard Sanitary Corporation, New York, N.Y., a corporation of Delaware
Continuation of design application Ser. No. 81,457, Aug. 26, 1964. This application Feb. 15, 1965, Ser. No. 83,820
Term of patent 14 years
(Cl. D4—2)



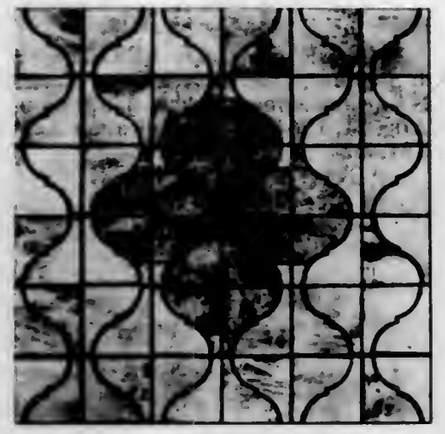
205,654
VACUUM CLEANER
Meyric K. Rogers, La Grange Park, and Norman A. Steinkamp, Chicago Heights, Ill., assignors to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Filed Dec. 15, 1965, Ser. No. 182
Term of patent 14 years
(Cl. D9—2)



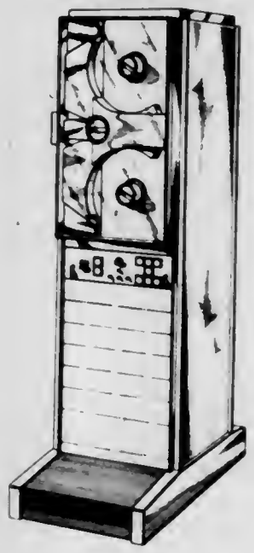
205,655
CATTLE FEEDER
George D. Clugston, 703 E. Quincy, Pittsburg, Kans.
Filed Oct. 12, 1965, Ser. No. 87,441
Term of patent 14 years
(Cl. D12—2)

205,656
HOLDER FOR FOOD PAN FOR PETS
Tony Robert, 5701 Southwest Freeway, Houston, Tex.
Filed Oct. 18, 1965, Ser. No. 87,543
Term of patent 14 years
(Cl. D12—2)

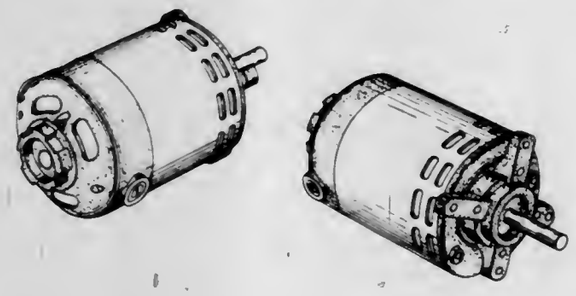
205,657
CHILD'S CHAIR
Marco Zanuso, Via Laveno 6, Milan, Italy
Filed Feb. 24, 1965, Ser. No. 83,964
Term of patent 7 years
(Cl. D15—1)



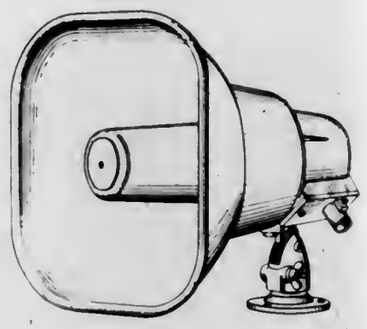
205,658
CHAIR
Walter Muller, Lerchenbergstrasse 123, Erlenbach, Zurich, Switzerland
Filed June 11, 1965, Ser. No. 85,692
Claims priority, application Switzerland Feb. 3, 1965
Term of patent 14 years
(Cl. D15—1)



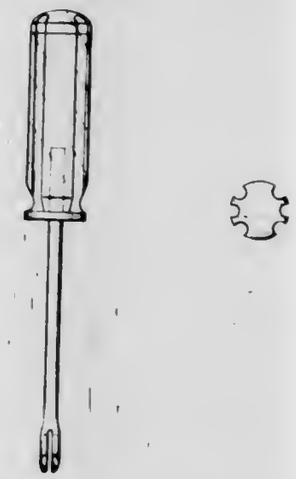
205,659
RE-USABLE BUNDLING STRAP
Raymond F. Piasecki, Hazlet, N.J., assignor to The Thomas & Betts Co., Elizabeth, N.J., a corporation of New Jersey
Filed Oct. 13, 1965, Ser. No. 87,459
Term of patent 14 years
(Cl. D17—5)



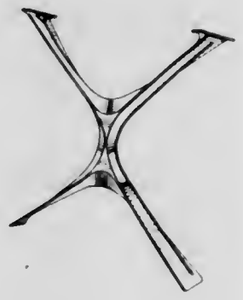
205,660
CERAMIC TILE UNIT
Sidney Goldman, 1786 Schenectady Ave., Brooklyn, N.Y.
Filed May 12, 1965, Ser. No. 85,242
Term of patent 3½ years
(Cl. D18—2)



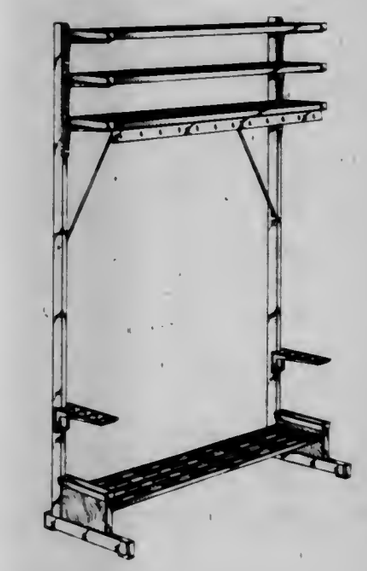
205,661
MAGNETIC TAPE TRANSPORT
Charles F. Grossman, Sunnyvale, Calif., and Marvin A. Southcott, Baltimore, Md., assignors to Ampex Corporation, Redwood City, Calif., a corporation of California
Filed June 14, 1965, Ser. No. 85,728
Term of patent 3½ years
(Cl. D26—5)



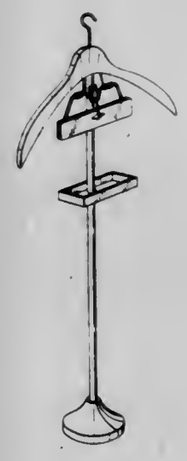
205,662
UNIVERSAL MOTOR SHELL
Gary G. Bluemink, Racine, Wis., assignor, by mesne assignments, to MSL Industries, Inc., Racine, Wis., a corporation of Minnesota
Filed Sept. 10, 1965, Ser. No. 86,939
Term of patent 14 years
(Cl. D26—5)



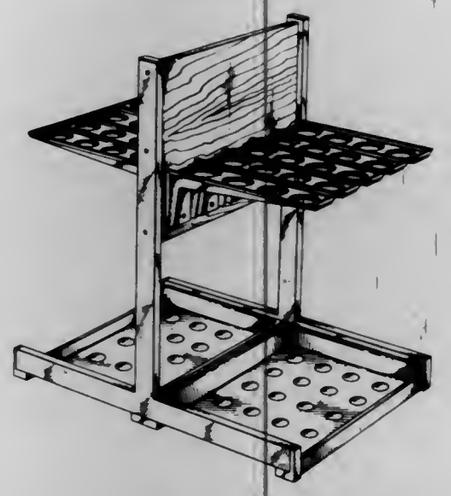
205,663
LOUDSPEAKER OR SIMILAR ARTICLE
Frederick L. Seebinger, West Hempstead, N.Y., assignor to American Trading & Production Corporation, Baltimore, Md., a corporation of Maryland
Filed June 30, 1965, Ser. No. 85,965
Term of patent 14 years
(Cl. D26—14)



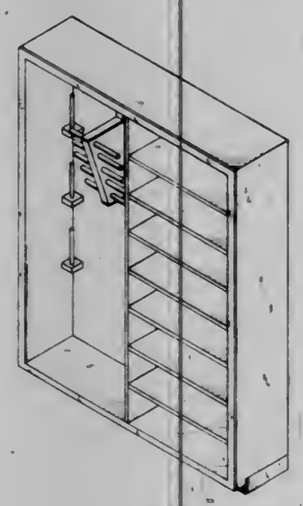
205,664
FISH HOOK REMOVER
Thomas W. Drake, 323 Lindale, Houston, Tex.
Filed Mar. 31, 1965, Ser. No. 84,544
Term of patent 14 years
(Cl. D31—4)



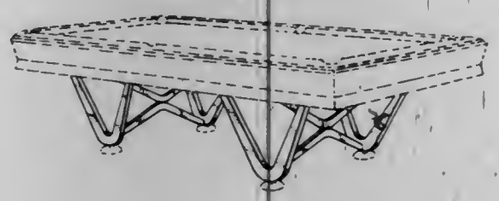
205,665
FURNITURE LEG
George H. Nelson, New York, N.Y., assignor to Herman Miller, Inc., Zeeland, Mich., a corporation of Michigan
Filed Apr. 12, 1965, Ser. No. 84,749
Term of patent 14 years
(Cl. D33—1)



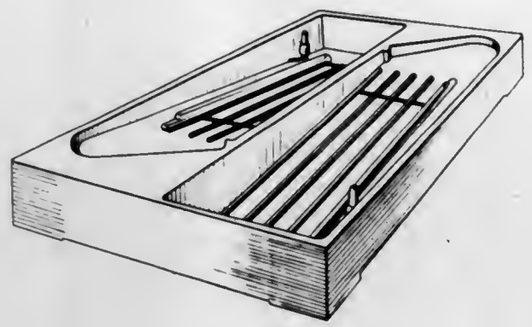
205,666
GARMENT RACK
Raymond A. Magnuson, Hinsdale, and Robert W. Schier, Northbrook, Ill., assignors to Vogel-Peterson Co., Chicago, Ill., a corporation of Illinois
Filed June 15, 1965, Ser. No. 85,746
Term of patent 14 years
(Cl. D33—8)



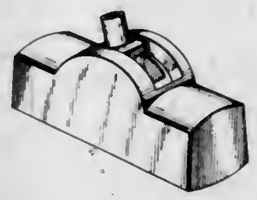
205,667
COMBINED VALET AND CLOTHES HANGER
Harry Ernest Rubens, Gorham Island, Westport, Conn. (2 Sutton Place S., New York, N.Y. 10022)
Filed Oct. 21, 1965, Ser. No. 87,710
Term of patent 14 years
(Cl. D33—8)



205,668
UMBRELLA STAND
Raymond A. Magnuson, Hinsdale, and Robert W. Schier, Northbrook, Ill., assignors to Vogel-Peterson Co., Chicago, Ill., a corporation of Illinois
Filed June 15, 1965, Ser. No. 85,749
Term of patent 14 years
(Cl. D33—17)

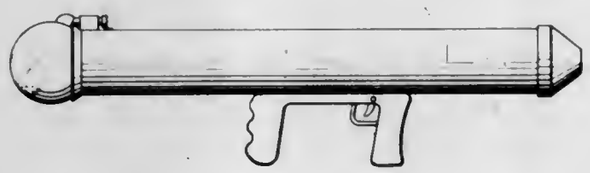


205,669
CABINET FOR ACCOMMODATING X-RAY TECHNICIANS' APPAREL
Jacqueline Mary Motzel, Madison, Wis., assignor to Sisters of St. Mary of the Third Order of St. Francis, St. Louis, Mo.
Filed Dec. 14, 1964, Ser. No. 83,002
Term of patent 14 years
(Cl. D33—19)

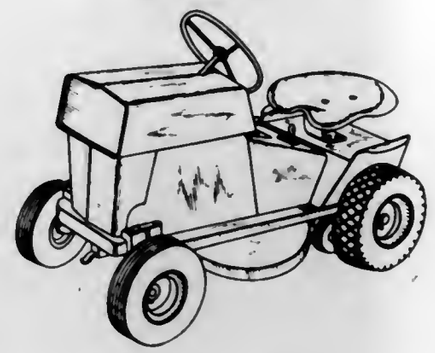


205,670
BILLIARD TABLE OR THE LIKE
Richard G. Reineman, Balboa, Calif., assignor to Brunswick Corporation, a corporation of Delaware
Filed Oct. 14, 1965, Ser. No. 87,481
Term of patent 14 years
(Cl. D34—3)

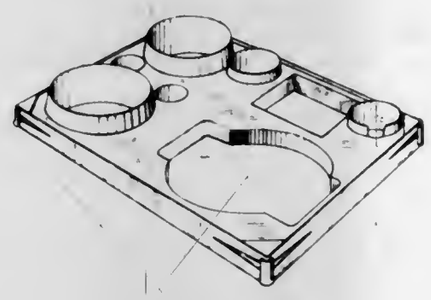
205,671
MARBLE-GAME TRAY
Ernest J. Swimmer, 340 E. 52nd St., New York, N.Y.
Filed July 12, 1965, Ser. No. 86,126
Term of patent 7 years
(Cl. D34—5)



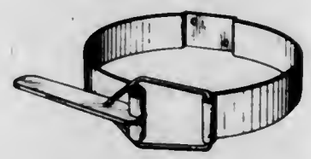
205,672
GOLF CLUB HEAD
Ernest R. Andis, 3528 N. Bay Drive, Racine, Wis.
Filed Oct. 5, 1965, Ser. No. 87,327
Term of patent 14 years
(Cl. D34—5)



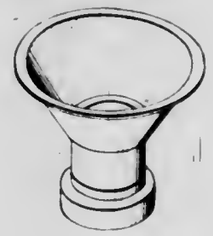
205,673
DISHED STAR KITE
Monroe D. Johnson, Jr., 4620 Oregon Trail, and Warren A. Tuckness, 1007 W. Virginia, both of Amarillo, Tex.
Filed Oct. 5, 1964, Ser. No. 82,027
Term of patent 14 years
(Cl. D34—15)



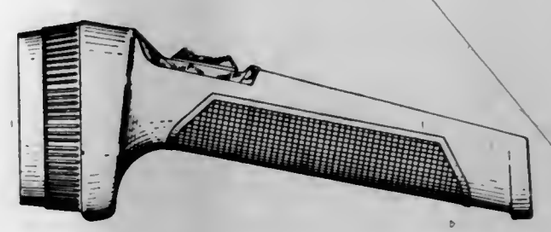
205,674
KALEIDOSCOPE
Edgar A. Powers, 104 Church St., Lake Ronkonkoma, N.Y.
Filed Oct. 7, 1965, Ser. No. 87,355
Term of patent 14 years
(Cl. D34—15)



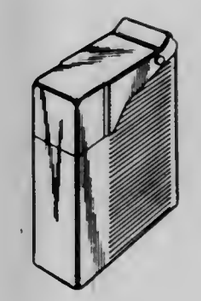
205,675
LAWN TRACTOR
Irving Berger, 1 Constitution St., Bristol, R.I.
Filed Oct. 13, 1965, Ser. No. 87,453
Term of patent 3½ years
(Cl. D40—1)



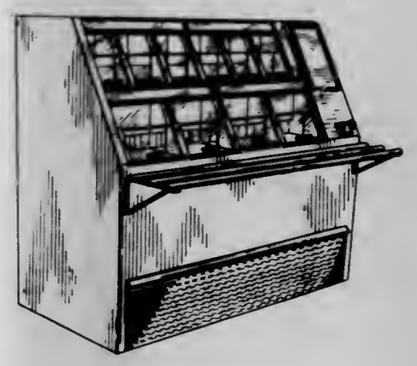
205,676
FOOD SERVING TRAY OR SIMILAR ARTICLE
Robert M. Kirwan, 135 N. 20th Ave., Melrose Park, Ill., and Adam Senese, 9100 S. 55th Ave., Oaklawn, Ill.
Filed Sept. 24, 1965, Ser. No. 87,151
Term of patent 3½ years
(Cl. D44—10)



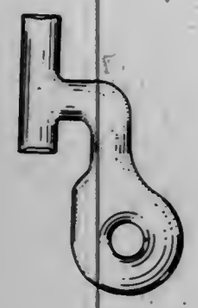
205,677
HOLDER FOR CANS OR THE LIKE
Donald L. Hartshorn, P.O. Box 672, Syracuse, Kans.
Filed Apr. 23, 1965, Ser. No. 84,937
Term of patent 7 years
(Cl. D44—21)



205,678
VISCOUS FLUIDS TRANSFER FUNNEL OR THE LIKE
Daniel S. Williams, 47 S. 3rd St., Reading, Pa.
Filed Oct. 20, 1965, Ser. No. 87,656
Term of patent 3½ years
(Cl. D44—29)

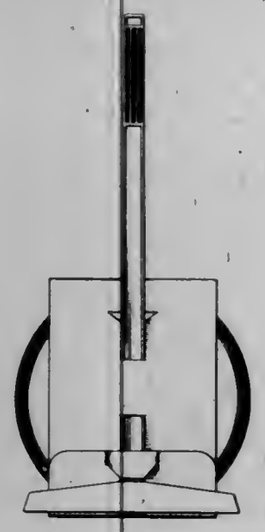


205,679
FLASHLIGHT OR SIMILAR ARTICLE
Arthur H. Moore, Fairfield, and Joseph G. Bacevius, Bridgeport, Conn., assignors to The Bridgeport Metal Goods Manufacturing Company, Bridgeport, Conn., a corporation of Connecticut
Filed Nov. 23, 1965, Ser. No. 88,193
Term of patent 14 years
(Cl. D48—24)

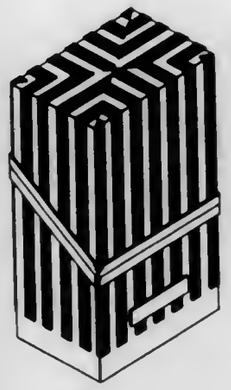


205,680
CIGARETTE LIGHTER OR SIMILAR ARTICLE
Olle E. Haggstrom, Trumbull, Carl N. Johnson, Stratford, and William V. Judson, Westport, Conn., assignors to General Electric Company, a corporation of New York
Filed June 14, 1965, Ser. No. 85,710
Term of patent 3½ years
(Cl. D48—27)

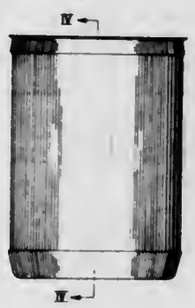
205,681
PRODUCT DISPENSING MACHINE
Boley A. Andrews, Mission, Kans., and Le Roy D. Gore, Independence, Mo., assignors to The Vendo Company, Kansas City, Mo., a corporation of Missouri
Filed June 10, 1965, Ser. No. 85,655
Term of patent 3½ years
(Cl. D52—3)



205,682
AUTOMOBILE TIE-DOWN HOOK
Larry Labell, Detroit, Mich., assignor to Vulcan Chain Corporation, Detroit, Mich.
Filed Aug. 11, 1965, Ser. No. 86,539
Term of patent 3½ years
(Cl. D54—11)

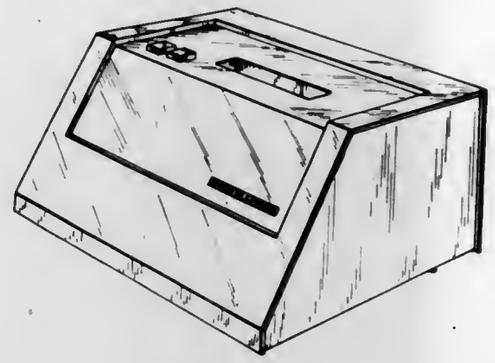


205,683
COMBINED CONTACT LENS INSERTER AND APPLICATOR
Abraham Toran, 620 Pearl St., Oceanside, N.Y.
Filed Oct. 22, 1965, Ser. No. 87,739
Term of patent 14 years
(Cl. D57—1)

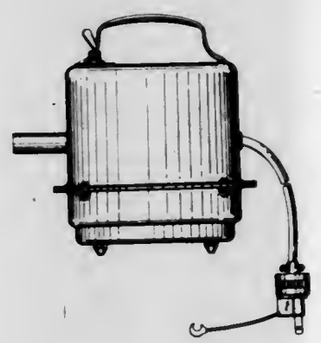


205,684
PACKAGED HOOP AND HOOP STICK
Donald W. Schumm, 7204 Riverton, and Doyle C. Shady, 4916 Golfview, both of Fort Wayne, Ind.
Filed Apr. 19, 1965, Ser. No. 84,873
Term of patent 3½ years
(Cl. D58—2)

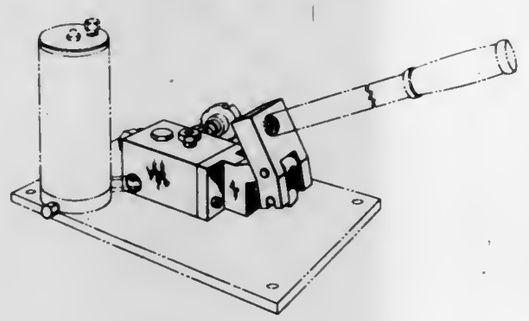
205,685
BOX
Wesley W. Simpson, New York, N.Y., assignor to Adele Simpson Inc., New York, N.Y., a corporation of New York
Filed July 16, 1965, Ser. No. 86,244
Term of patent 3½ years
(Cl. D58—12.6)



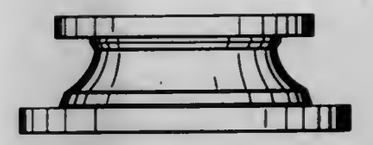
205,686
PLASTIC CAN
Paul A. Marchant, Kansas City, Mo., assignor to Rexall Drug and Chemical Company, Los Angeles, Calif., a corporation of Delaware
Filed Sept. 8, 1964, Ser. No. 81,626
Term of patent 14 years
(Cl. D58—17)



205,687
COMBINED JAR AND COVER THEREFOR
Charley F. Bartlett, Sapulpa, Okla., assignor to Bartlett-Collins Company, Sapulpa, Okla., a corporation of Oklahoma
Filed Oct. 18, 1965, Ser. No. 87,580
Term of patent 14 years
(Cl. D58—25)

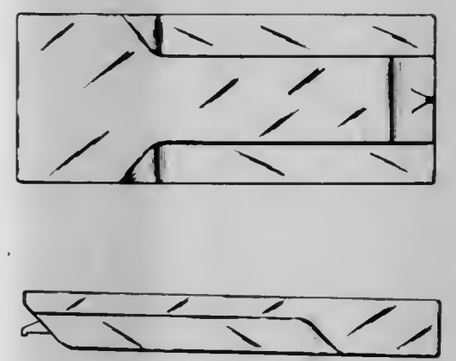


205,688
APPARATUS FOR EXPOSING LIGHT SENSITIVE PHOTOGRAPHIC FILM
Harold Lakin, San Mateo, Calif., assignor to Litton Precision Products, Inc., San Carlos, Calif., a corporation of Delaware
Filed Sept. 20, 1965, Ser. No. 87,073
Term of patent 14 years
(Cl. D61—1)

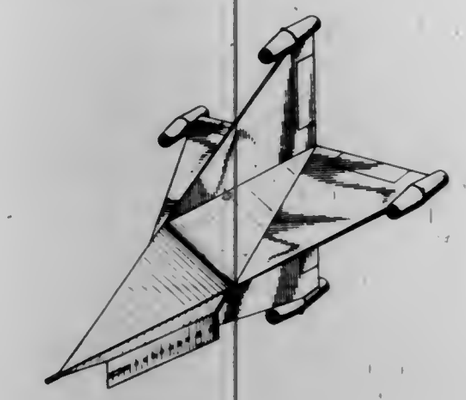


205,689
PORTABLE BLOWER
Julius W. Rubin, 94 Reed Drive, Roslyn, Long Island, N.Y.
Filed Oct. 23, 1965, Ser. No. 87,863
Term of patent 7 years
(Cl. D62—2)

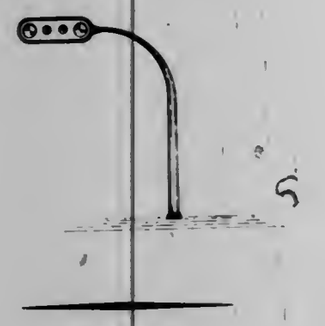
205,690
HAND PUMP
Gordon Allard, Menomonee Falls, Wis., assignor to Applied Power Industries, Inc., a corporation of Wisconsin
Filed July 27, 1965, Ser. No. 86,311
Term of patent 14 years
(Cl. D65—1)



205,691
PUMP TO MOTOR ADAPTER
Allen M. Rullifson, 1411 Morena, San Diego, Calif.
Filed Oct. 21, 1965, Ser. No. 87,665
Term of patent 14 years
(Cl. D65—1)



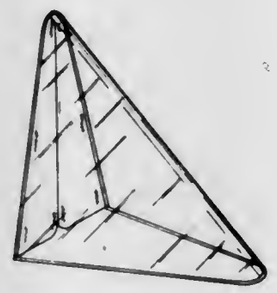
205,692
REFRIGERATOR DOOR HANDLE
Carl W. Sundberg, Bloomfield Hills, and Richard E. Hitchcock, Birmingham, Mich., assignors to Whirlpool Corporation, a corporation of Delaware
Filed Sept. 20, 1965, Ser. No. 87,066
Term of patent 3½ years
(Cl. D67—3)



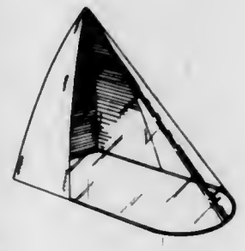
205,693
HULL
William O. Doty, 406 Smedeker Ave., Jerseyville, Ill.
Filed Dec. 9, 1965, Ser. No. 132
Term of patent 14 years
(Cl. D71—1)

205,694
HIGH-SPEED DIRIGIBLE
Frank A. Petry, 1615 Armacost Ave., Los Angeles, Calif.
Filed June 1, 1965, Ser. No. 85,526
Term of patent 14 years
(Cl. D71—1)

205,695
TRAFFIC SIGNAL
Douglas B. Hughes, Montreal, Quebec, Canada, assignor to Canadian Aviation Electronics Ltd., Montreal, Quebec, Canada
Filed Mar. 8, 1963, Ser. No. 73,886
Claims priority, application Canada Nov. 8, 1962
Term of patent 14 years
(Cl. D72—1)



205,696
TRAFFIC SIGNAL
Howard E. Miller, Douglas County Court House, Tuscola, Ill.
Filed Oct. 15, 1965, Ser. No. 87,517
Term of patent 14 years
(Cl. D72—1)



205,697
BASE FOR FIREPLACES, STOVES, BARBECUE GRILLES AND THE LIKE
Robert D. Thulman, 10002 Frederick Ave., Kensington, Md.
Filed July 12, 1965, Ser. No. 86,113
Term of patent 14 years
(Cl. D81—7)

205,698
SOLARIUM
Mike Tecton, 5101 45th St. NW., Washington, D.C.
Filed Mar. 10, 1965, Ser. No. 84,195
Term of patent 14 years
(Cl. D83—1)

205,699
COMBINATION CABANA AND SOLARIUM THEREFOR
Mike Tecton, 5101 45th St. NW., Washington, D.C.
Filed Mar. 16, 1965, Ser. No. 84,288
Term of patent 14 years
(Cl. D83—1)

205,700
COMBINED COMB AND HAIR TONIC HOLDER THEREIN
Homer M. Hare, Jr., 3836 Don Julio Blvd., North Highlands, Calif.
Filed Dec. 1, 1964, Ser. No. 82,860
Term of patent 14 years
(Cl. D86—8)

205,701
FLOOR COVERING OR THE LIKE
Philipp Ross Yost, 1324 Broadway, San Francisco, Calif.
Filed June 29, 1964, Ser. No. 80,637
Term of patent 14 years
(Cl. D92—4)

LIST OF REISSUE PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 6TH DAY OF SEPTEMBER, 1966

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Bentley, John M., and J. H. Brown, to United States of America, Navy. Direct current digital-to-analogue decoder. Re. 26,076, 9–6–66, Cl. 340—347.

Brown, James H.: *See*—
Bentley, John M., and Brown. Re. 26,076.

Canno, Leonard E., to Equitable Paper Bag Co., Inc. Method of making reinforced plastic bags. Re. 26,075, 9–6–66, Cl. 156—202.

Equitable Paper Bag Co., Inc.: *See*—
Canno, Leonard E. Re. 26,075.

Gouker, Zelbert, and R. C. Storkan, said Gouker assor. to said Storkan. Apparatus for gathering pliofilm sheeting from a field. Re. 26,077, 9–6–66, Cl. 100—97.

Mangone, Ivan W., to Offshore Structures & Service Co. Mobile self-erecting marine platforms. Re. 26,073, 9–6–66, Cl. 61—46.5.

McLean, Robert E., to Rival Mfg. Co. Can opener with improved single-action mechanism and cutter member support. Re. 26,074, 9–6–66, Cl. 30—9.

Offshore Structures & Service Co.: *See*—
Mangone, Ivan W. Re. 26,073.

Rival Mfg. Co.: *See*—
McLean, Robert E. Re. 26,074.

Storkan, Richard C.: *See*—
Gouker, Zelbert, and Storkan. Re. 26,077.

United States of America
Navy: *See*—
Bentley, John M., and Brown. Re. 26,076.

LIST OF PLANT PATENTEES

Armstrong Nurseries, Inc.: *See*—
Swim, Herbert C. 2,668.
Chabert, Andre. 2,669.

Chabert, Andre, to Armstrong Nurseries, Inc. Rose plant. 2,669, 9–6–66, Cl. 18.

Duffett, William E., to O. O. Dunham. Chrysanthemum plant. 2,670, 9–6–66, Cl. 78.

Dunham, Orville O.: *See*—
Duffett, William E. 2,670.

Inter-State Nurseries, Inc.: *See*—
Porter, Albert J. 2,667.

Porter, Albert J., to Inter-State Nurseries, Inc. Crab apple tree. 2,667, 9–6–66, Cl. 34.

Swim, Herbert C., to Armstrong Nurseries, Inc. Camellia plant. 2,668, 9–6–66, Cl. 62.

LIST OF DESIGN PATENTEES

Allard, Gordon, to Applied Power Industries, Inc. Hand pump. 205 690, 9–6–66, Cl. D65—1.

American Radiator & Standard Sanitary Corp.: *See*—
Niemann, James E. 205,653.

American Trading & Production Corp.: *See*—
Seebinger, Frederick L. 205,663.

Ampex Corp.: *See*—
Grossman, Charles F., and Southcott. 205,661.

Andis, Ernest R. Golf club head. 205,672, 9–6–66, Cl. D34—5.

Andrews, Boley A., and L. D. Gore, to The Vendo Co. Product dispensing machine. 205 681, 9–6–66, Cl. D52—3.

Applied Power Industries, Inc.: *See*—
Allard, Gordon. 205,690.

Bartlett, Charley F., to Bartlett-Collins Co. Combined jar and cover therefor. 205,687, 9–6–66, Cl. D58—25.

Bartlett-Collins Co.: *See*—
Bartlett, Charley F. 205,687.

Berger, Irving. Lawn tractor. 205,675, 9–6–66, Cl. D40—1.

Bluemink, Gary G., to M & L Industries, Inc. Universal motor shell. 205,662, 9–6–66, Cl. D26—5.

Bridgeport Metal Goods Mfg. Co., The: *See*—
Moore, Arthur H., and Bacevius. 205,679.

Brockway, Brock F., to E. D. Bullard Co. Safety helmet. 205,652. 9–6–66, Cl. D3—13.

Brunswick Corp.: *See*—
Reineman, Richard G. 205,670.

Bullard, E. D., Co.: *See*—
Brockway, Brock F. 205,652.

Canadian Aviation Electronics Ltd.: *See*—
Hughes, Douglas B. 205,695.

Clugston, George D. Cattle feeder. 205,655, 9–6–66, Cl. D12—2.

Doty, William O. Hull. 205,693, 9–6–66, Cl. D71—1.

Drake, Thomas W. Fish hook remover. 205,664, 9–6–66, Cl. D31—4.

General Electric Co.: *See*—
Haggstrom, Olle E., Johnson, and Judson. 205,680.

Goldman, Sidney. Ceramic tile unit. 205,660, 9–6–66, Cl. D18—2.

Grossman, Charles F., and M. A. Southcott, to Ampex Corp. Magnetic tape transport. 205 661, 9–6–66, Cl. D26—5.

Haggstrom, Olle E., C. N. Johnson, and W. V. Judson, to General Electric Co. Cigarette lighter or similar article. 205,680, 9–6–66, Cl. D48—27.

Hare, Homer M., Jr. Combined comb and hair tonic holder therein. 205,700, 9–6–66, Cl. D86–8.

Hartshorn, Donald L. Holder for cans or the like. 205,677, 9–6–66, Cl. D44—21.

Hughes, Douglas B., to Canadian Aviation Electronics Ltd. Traffic signal. 205,695, 9–6–66, Cl. D72—1.

Johnson, Monroe D., Jr., and W. A. Tuckness. Dished star kite. 205 673, 9–6–66, Cl. D34—15.

Kirwan, Robert M., and A. Senese. Food serving tray or similar article. 205,676, 9–6–66, Cl. D44—10.

Labell, Larry, to Vulcan Chair Corp. Automobile tie-down hook. 205,682, 9–6–66, Cl. D54—11.

Lakin, Harold, to Litton Precision Products, Inc. Apparatus for exposing light sensitive photographic film. 205,688, 9–6–66, Cl. D61—1.

Litton Precision Products, Inc.: *See*—
Lakin, Harold. 205,688.

M & L Industries, Inc.: *See*—
Bluemink, Gary G. 205,662.

Magnuson, Raymond A., and R. W. Schier, to Vogel-Peterson Co. Garment rack. 205,666, 9–6–66, Cl. D33—8.

Magnuson, Raymond A., and R. W. Schier, to Vogel-Peterson Co. Umbrella stand. 205,668, 9–6–66, Cl. D33—17.

Marchant, Paul A., to Rexall Drug and Chemical Co. Plastic can. 205,686, 9–6–66, Cl. D58—17.

Miller, Herman, Inc.: *See*—
Nelson, George H. 205,665.

Miller, Howard E. Traffic signal. 205,696, 9–6–66, Cl. D72—1.

Moore, Arthur H., and J. G. Bacevius, to The Bridgeport Metal Goods Mfg. Co. Flashlight or similar article. 205,679, 9–6–66, Cl. D48—24.

Motzel, Jacqueline M., to Sisters of St. Mary of The Third Order of St. Francis. Cabinet for accommodating X-ray technicians' apparel. 205,669, 9–6–66, Cl. D33—19.

Muller, Walter. Chair. 205,658, 9–6–66, Cl. D15—1.

Nelson, George H., to Herman Miller, Inc. Furniture leg. 205,665, 9–6–66, Cl. D33—1.

Niemann, James E., to American Radiator & Standard Sanitary Corp. Lavatory. 205,653, 9–6–66, Cl. D4—2.

Piasecki, Raymond F., to The Thomas & Betts Co. Re-usable bundling strap. 205,659, 9–6–66, Cl. D17—5.

Petry, Frank A. High-speed dirigible. 205,694, 9–6–66, Cl. D71—1.

Powers, Edgar A. Kaleidoscope. 205,674, 9–6–66, Cl. D34—15.

Reineman, Richard G., to Brunswick Corp. Billiard table or the like. 205,670, 9–6–66, Cl. D34—3.

Rexall Drug and Chemical Co.: *See*—
Marchant, Paul A. 205,686.

Robert, Tony. Holder for food pan for pets. 205,656, 9–6–66, Cl. D12—2.

Rogers, Meyric K., and N. A. Steinkamp, to Sunbeam Corp. Vacuum cleaner. 205,654, 9–6–66, Cl. D9—2.

Rubens, Harry E. Combined valet and clothes hanger. 205,667, 9–6–66, Cl. D33—8.

Rubin, Julius W. Portable blower. 205,689, 9–6–66, Cl. D62—2.

Ruiffson, Allen M. Pump to motor adapter. 205,691, 9–6–66, D65—1.

Schumm, Donald W., and D. C. Shady. Packaged hoop and hoop stick. 205,684, 9–6–66, Cl. 58—2.

Seebinger, Frederick L., to American Trading & Production Corp. Loudspeaker or similar article. 205,663, 9–6–66, Cl. D26—14.

Simpson, Adele, Inc.: *See*—
Simpson, Wesley W. 205,685.

Simpson, Wesley W., to Adele Simpson, Inc. Box. 205,685, 9–6–66, Cl. D58—12.6.

Sisters of St. Mary of The Third Order of St. Francis: *See*—
Motzel, Jacqueline M. 205,669.
Stahmer, Bernhardt. Hat or similar article. 205,651, 9–6–66, Cl. D3—13.
Sunbeam Corp.: *See*—
Rogers, Meyric K., and Steinkamp. 205,654.
Sundberg, Carl W., and R. E. Hitchcock, to Whirlpool Corp. Refrigerator door handle. 205,692, 9–6–66, Cl. D67—3.
Swimmer, Ernest J. Marble-game tray. 205,671, 9–6–66, Cl. D34—5.
Tecton, Mike. Solarium. 205,698, 9–6–66, Cl. D83—1.
Tecton, Mike. Combination cabana and solarium therefor. 205,699, 9–6–66, Cl. D83—1.
Thomas & Betts Co., The: *See*—
Piasecki, Raymond F. 205,659.
Thulman, Robert D. Base for fireplaces, stoves, barbecue grilles, and the like. 205,697, 9–6–66, Cl. D81—7.
Toran, Abraham. Combined contact lens inserter and applicator. 205,683, 9–6–66, Cl. D57—1.
Vendo Co., The: *See*—
Andrews, Boley A., and Gore. 205,681.
Vogel-Peterson Co.: *See*—
Magnuson, Raymond A., and Schier. 205,666.
Magnuson, Raymond A., and Schier. 205,668.
Vulcan Chair Corp.: *See*—
Labell, Larry. 205,682.
Whirlpool Corp.: *See*—
Sundberg, Carl W., and Hitchcock. 205,692.
Williams, Daniel S. Viscous fluids transfer funnel or the like. 205,678, 9–6–66, Cl. D44—29.
Yost, Philipp R. Floor covering or the like. 205,701, 9–6–66, Cl. D92—4.
Zanuso, Marco. Child's chair. 205,657, 9–6–66, Cl. D15—1.

LIST OF PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 6TH DAY OF SEPTEMBER, 1966

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

AB Tetra Pak: *See*—
Rausing, Anders R. 3,270,876.
AGA Aktiebolag: *See*—
Bergstrom, Axel E., Hallhagen, Soderberg, and Westberg. 3,271,504.
AMP Inc.: *See*—
Bakker, Roel, and Obert. 3,271,729.
Harner, Donald R., and Plaxa. 3,271,747.
Demler, Henry W., and Ziegler. 3,270,392.
API Instruments Co.: *See*—
Quittner, George F. 3,271,662.
A. T. I. Industries, Inc.: *See*—
Dellett, Harold W., and Crump. 3,271,505.
Abbott, Daniel B.: *See*—
Huntington, Andrew B., Abbott, and Brinkel. 3,270,625.
Abegg & Reinhold Co.: *See*—
Kingsbury, Guy W. 3,270,389.
Abrasive Developments Ltd.: *See*—
Ashworth, Stewart I., and Field. 3,270,463.
Acec Ateliers de Constructions Electriques de Charleroi: *See*—
Philips, Henri J. 3,271,659.
Achon, Marco A., and J. A. Price, to Avisum Corp. Catalyst system for the copolymerization of olefins. 3,271,376, 9–6–66, Cl. 260—88.2.
Acker, Richard E., to Huber-Warco Co. Tandem rollers. 3,271,041, 9–6–66, Cl. 280—43.23.
Ackles, Virgil E. Conveyor driving unit. 3,270,863, 9–6–66, Cl. 198—203.
Ackley, John W., to Deere & Co. Sprayer nozzle. 3,270,966, 9–6–66, Cl. 239—550.
Adams, Charles A. Toilet flushing process and apparatus to restore height of water. 3,270,351, 9–6–66, Cl. 4—41.
Adams, Charles A., to Motorola, Inc. Oscillator with resonant circuit connected to transistor housing. 3,271,698, 9–6–66, Cl. 331—117.
Adams, George E., G. H. Whale, and J. H. A. Hanson, to Dunlop Rubber Co. Ltd. Wheel manufacture. 3,270,402, 9–6–66, Cl. 29—159.01.
Adler, Robert, C. B. Crumly, L. C. Foster, and J. P. Lindley, to Zenith Radio Corp. Electron beam parametric amplifier with positive ion elimination. 3,271,731, 9–6–66, Cl. 330—4.7.
Advanced Kinetics, Inc.: *See*—
Furth, Harold P. 3,271,716.
Aebi, Claude M., to International Business Machines Corp. Thermo-developable diazo coatings employing dicyandiamide compositions. 3,271,155, 9–6–66, Cl. 96—75.
Aerojet-General Corp.: *See*—
Henriksen, Erik K. 3,270,556.
Agfa Aktiengesellschaft: *See*—
Engelsmann, Dieter, and Zobel. 3,270,645.
Engelsmann, Dieter. 3,270,648.
Hofmann, Wilfried, and Winkler. 3,270,640.
Jakob, Franz, and Spatz. 3,270,647.
Neudecker, Karl, and Zanner. 3,271,098.
Aghnides, Elie P. Self-sealing and deposit-proof aerator. 3,270,965, 9–6–66, Cl. 239—428.5.
Aghnides, Elie P. Molded water aerators. 3,270,964, 9–6–66, Cl. 239—428.5.
Ahlberg, Richard E., and J. E. Schrems, to The Dow Chemical Co. Traction increaser comprising polydihydroquinolines and rosin. 3,271,170, 9–6–66, Cl. 106—36.
Air Products and Chemical, Inc.: *See*—
McEvoy, James E., and Shalit. 3,271,327.
Air Reduction Co. Inc.: *See*—
Weber, Bernhard W. A. 3,271,559.
Ajam, Mustafa J., to Williams & Hussey Machine Corp. Rotary sliding-vane pump. 3,270,675, 9–6–66, Cl. 103—42.
Akbar, Mohammed A., and H. Simonis, to Hans J. Zimmer Verfahrenstechnik. Process for the polycondensation of furfuryl alcohol. 3,271,421, 9–6–66, Cl. 260—347.8.
Akin, George A., S. J. Rush, and N. C. Russin, to Eastman Kodak Co. Poly (1,4-cyclohexylenedimethylene terephthalate) process using substantially equal proportions of reactants. 3,271,370, 9–6–66, Cl. 260—75.
Albert, Walter, L. Bohn, J. Ebigt, H. Oberst, and H. Pfister, to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning. Vibration damping polymer mixture on metal plate. 3,271,188, 9–6–66, Cl. 117—132.
Albin, Alvina K. Baby exerciser. 3,271,028, 9–6–66, Cl. 272—57.
Alcan Aluminum Corp.: *See*—
Wegner, Herman E. 3,270,620.
Alderson, Edgar D., to General Electric Co. Diverter valve assembly. 3,270,775, 9–6–66, Cl. 137—609.
Allegretti, John E., to Merck & Co., Inc. Producing an N+N junction using antimony. 3,271,208, 9–6–66, Cl. 148—175.
Allen, Robert L., to Georgia Tech Research Institute. Variable displacement pump. 3 270,674, 9–6–66, Cl. 103—38.
Allen, Theodore E., W. R. Baker, R. H. Bidlack, K. N. Gardner, W. E. Mullan, Jr., M. E. Ozenberger, and L. E. Van Damme, to Bell Telephone Laboratories, Inc. Key-type common control telephone switching system. 3,271,524, 9–6–66, Cl. 179—27.
Allen, Thomas C., and H. J. Watson, to Dan River Mills Inc. Textile treatments and treated textiles. 3,271,305, 9–6–66, Cl. 252—8.6.
Allentoff, Norman, and L. M. Minsk, to Eastman Kodak Co. Photographic silver halide emulsions having high wet density retention. 3,271,158, 9–6–66, Cl. 96—67.
Allied Chemical Corp.: *See*—
Bostian, Logan C., and Heffner. 3,271,335.
Hazelton, Russell F. 3,271,116.
Pickens, Donald. 3,271,454.
Poor, John G. 3,271,279.
Allis-Chalmers Mfg. Co.: *See*—
Whisler, Paul A. 3,270,579.
Alloys Unlimited, Inc.: *See*—
Elliott, Charles G. 3,271,507.
Allred, Victor D., to Marathon Oil Co. Process of calcining coke. 3,271,268, 9–6–66, Cl. 201—20.
Almasfuzitoi Timfoldgyar: *See*—
Juhasz, Adam, and Konkoly. 3,270,887.
Alnwick Investments Ltd.: *See*—
Humphrey, Frederick H. 3,270,388.
Alsys, Clarence M. Humidification of shirred artificial sausage casings. 3,271,168, 9–6–66, Cl. 99—176.
American Bosch Arma Corp.: *See*—
Moravek, Joseph J., and Figalora. 3,270,568.
American Cyanamid Co.: *See*—
Chopoorian, John A. 3,271,176.
Frazza, Everett J., and Rapoport. 3,271,408.
Welcher, Richard P. 3,271,449.
Wilkinson, Raymond G., and Shepherd. 3,271,450.
American Enka Corp.: *See*—
De Langen, Lambertus H. 3,270,491.
Hartong, Augustinus L. H. 3,271,348.
Van den Berge, Cornelis. 3,271,493.
American Home Products Corp.: *See*—
Gandler, John C. C. 3,270,714.
Lefebvre, Yvon. 3,271,392.
American Machine & Foundry Co.: *See*—
Dearsley, George. 3,270,856.
Thomas, Robert. 3,270,411.
American Motors Corp.: *See*—
Teague, Richard A. 3,271,066.
Amering, Charles F.: *See*—
Russell, Harold D., and Amering. 3,270,654.
Ametek, Inc.: *See*—
Anderson, Kenneth A. 3,270,885.
Anderson, Kenneth A. 3,270,888.
Amicon Corp.: *See*—
Michaels, Alan S. 3,271,496.
Ampex Corp.: *See*—
Cochran, Donald J., and Patterson. 3,271,526.
Sperry, John D., and Siegel. 3,270,975.
Amut s.p.A. Novara-Veveri: *See*—
Borrini, Geo. 3,270,806.
Anaconda Wire and Cable Co.: *See*—
Burr, Harvey. 3,271,508.
Lanach, John L. 3,271,752.
Anagnostopoulos, Constantine E.: *See*—
Coran, Anbert Y., and Anagnostopoulos. 3,271,358.
Andersen, Harry M., and W. R. Richard, Jr., to Monsanto Co. Polymerization of olefins by use of modified catalysts. 3,271,381, 9–6–66, Cl. 260—94.9.
Anderson, Ben M., to Anderson, Greenwood & Co. Tapered fastener. 3,271,058, 9–6–66, Cl. 287—199.86.
Anderson, Clayton & Co.: *See*—
Bentz, Irvin C. 3,271,433.
Anderson, Greenwood & Co.: *See*—
Anderson, Ben M. 3,271,058.
Anderson, Kenneth A., to Ametek, Inc. Filter. 3,270,885, 9–6–66, Cl. 210—112.
Anderson, Kenneth A., to Ametek, Inc. Rotary leaf filter. 3,270,888, 9–6–66, Cl. 210—329.
Anderson, Theodore C., and D. L. Favin, to Bell Telephone Laboratories, Inc. Apparatus for measuring envelope delay distortion wherein selected impulses of a high-frequency standard are gated to one input of a bistable phase comparator. 3,271,666, 9–6–66, Cl. 324—57.
Andreassen, Alfred E. O., to Chamberlain Corp. Method of making metallic shelving. 3,270,404, 9–6–66, Cl. 29—160.
Andrew Corp.: *See*—
Book, Eric G. 3,271,702.
Yang, Richard F. H. 3,271,775.
Andrews, Dallas R., to Radio Corp. of America. Positioning mechanism. 3,271,034, 9–6–66, Cl. 274—4.
Andt, John J. R., to Stein Hall & Co., Inc. Additive for baked goods to retard staling. 3,271,164, 9–6–66, Cl. 99—90.
Angus, George, & Co. Ltd.: *See*—
Jagger, Ernest T., and Hunter. 3,270,373.
Anstey, Nigel A., and W. E. Lerwill, to Seismograph Service Corp. Method and apparatus for correlating seismic disturbances against previously recorded signals. 3,271,732, 9–6–66, Cl. 340—15.5.

Anwyl, Robert D., and D. M. Peterson, to Eastman Kodak Co. Photometric system. 3,270,638, 9–6–66, Cl. 95—10.

Aoyagi, Tsutomu: *See*—
Harada, Kazuya, and Aoyagi. 3,271,482.

Applegate, Merlin J.: *See*—
Derler, Charles J., and Applegate. 3,270,690.

Apstein, Maurice: *See*—
Biggar, Allan M., and Apstein. 3,271,641.

Aqua-Dart, Inc.: *See*—
Rozanski, Frank G. 3,270,707.

Araujo, Nat E. Screw-threaded freeze plug pull-out tool with work engaging means. 3,270,407, 9–6–66, Cl. 29—259.

Archer-Daniels-Midland Co.: *See*—
Weber, Ralph O., and Horan. 3,271,267.
Cagneron, Lucien J., and Skaradzinski. 3,271,410.

Arcos Corp.: *See*—
Johnson, Wallace C. 3,271,553.

Arima, Asao: *See*—
Goda, Susumu, Gondo, Hiyoshi, and Arima. 3,271,206.

Arledter, Hanns F., C. R. Canfield, Jr., and D. C. Gillespie, to Borg-Warner Corp. Friction member with friction material. 3,270,846, 9–6–66, Cl. 192—107.

Armaki, Yoshitomo: *See*—
Kanazawa, Ken-Ichi, Matsukawa, and Armaki. 3,271,250.

Armfield, George W.: *See*—
Marsh, John A., and Armfield. 3,270,394.

Arcos Corp.: *See*—
Johnson, Wallace C. 3,271,554.

Armstrong Cork Co.: *See*—
Moggio, William A., Sparks, and Miller. 3,271,231.

Armstrong, Theodore, to Pacific Preserving Co. Fruit orienting, halving, and coring machine. 3,270,788, 9–6–66, Cl. 146—52.

Armstrong, Tobert G., to The Ohio Crankshaft Co. Mechanism for an induction heating apparatus. 3,271,019, 9–6–66, Cl. 266—4.

Arnold, Aaron: *See*—
Dennis, Emery W., and Arnold. 3,271,159.

Aronoff, Elihu J., and P. D. Whyzmuzis, to Interchemical Corp. Printing ink based on acrylic or methacrylic acid conolymers and polyoxyethylene. 3,271,347, 9–6–66, Cl. 260—31.4.

Arvesen, Oystein: *See*—
Kehn, Harold B., Sze, Cook, Secord, and Arvesen. 3,270,700.

Arvin Industries, Inc.: *See*—
Chesnut, Amos E. 3,271,546.

Asahi Dow Ltd.: *See*—
Sudo, Michio. 3,271,223.

Asahi Kasei Kogyo Kabushiki Kaisha: *See*—
Wakasa, Ryoichi, Shibata, Ohmura, and Suzuki. 3,271,346.

Ashbrook, Richard L.: *See*—
Freche, John C., Klima, and Ashbrook. 3,271,140.

Ashikaga, Tadao: *See*—
Fujii, Kiyoshi, Imoto, Ukida, and Ashikaga. 3,271,494.

Ashworth, Stewart I., and A. G. Field, to Abrasive Developments Ltd. Blasting machines. 3,270,463, 9–6–66, Cl. 51—8.

Associated Engineering Ltd.: *See*—
Brown, Dennis C., and Dickson. 3,271,281.

Atkins, David N., F. H. G. McCaffrey, and G. D. Taylor, to Canadian Industries. Shotshells. 3,270,669, 9–6–66, Cl. 102—42.

Atlantic Refining Co., The: *See*—
Brieger, Louis C., and Barta. 3,271,724.
Cleary, James M. 3,270,822.

Atlantic Research Corp.: *See*—
Silver, Bernard. 3,270,502.
Silver, Bernard. 3,270,668.

Atlas Copco Aktiebolag: *See*—
Bratt, Sven-Ake. 3,270,834.

Atlas, David, and R. M. Lhermitte, said Atlas assor., to United States of America, Air Force. Radar tornado alarm. 3,271,764, 9–6–66, Cl. 343—11.

Atlas mess-und Analysentechnik G.m.b.H.: *See*—
Brunnee, Curt. 3,270,773.

Atomic Energy of Canada Ltd.: *See*—
Watson, Robert D. 3,270,413.

Atron Corp.: *See*—
Paull, Morris. 3,270,614.

Attwood, Charles W. Building construction. 3,270,478, 9–6–66, Cl. 52—648.

Auer, Jay R., to G. D. Searle & Co. Dispensing means for pharmaceutical tablets. 3,270,915, 9–6–66, Cl. 221—2.

Augstein, Joachim, W. C. Austin, R. J. Boscott S. M. Green, and W. H. Hunter, to Chas. Pfizer & Co., Inc. Phenoxyalkyl aminoguanidines. 3,271,448, 9–6–66, Cl. 260—564.

Austin, John W. Fishing rod and attachment therefor. 3,270,457, 9–6–66, Cl. 43—15.

Austin, William C.: *See*—
Augstein, Joachim, Austin, Boscott, Green, and Hunter. 3,271,448.

Automatic Casting Corp.: *See*—
Madwed, Albert. 3,270,378.

Automatic Timing & Controls, Inc.: *See*—
Barth, Lewis E. 3,270,582.

Avco Corp.: *See*—
Bucher, Charles A., Jr. 3,271,682.
Colby, Ralph S. 3,270,839.
Fuhrwerk, Victor C., and Luthman. 3,270,858.

Pfendler, Donald L. 3,271,726.

Benson, Carl H., to O. F. Mossberg & Sons, Inc. Breech-bolt mechanism for bolt-action firearms. 3,270,456, 9–6–66, Cl. 42—16.

Benson, James M.: *See*—
Rudnicki, William E., and Benson. 3,270,583.

Bentz, Irvin C., to Clayton Anderson & Co. Process for semi-continuous hydrogenation of fat. 3,271,433, 9–6–66, Cl. 260—409.

Berchielli, Aldo S., and R. Di Pasquale, to Yardney International Corp. Electrodes and methods of making same. 3,271,195, 9–6–66, Cl. 136—67.

Berg, Daniel, to Westinghouse Electric Corp. Insulated electrical apparatus. 3,271,711, 9–6–66, Cl. 336—57.

Berge, Arthur. Device for organizing and planning various activities. 3,270,709, 9–6–66, Cl. 116—135.

Berger, Donald E.: *See*—
Ogle, Frank T., and Berger. 3,271,472.

Bergstrom, Axel E., R. G. Hallbagen, L. E. R. Soderberg, and J. E. Westberg, to AGA Aktiebolag. Apparatus and method for vulcanizing strips of material containing an elastomer. 3,271,504, 9–6–66, Cl. 264—347.

Bernard, Emil J. J., to Vereenigde Glasfabrieken (United Glassworks), N.V. Method of making hollow glassware with a stem and a foot. 3,271,123, 9–6–66, Cl. 65—80.

Bernard, John S. Method of conditioning liquid fuels. 3,270,722, 9–6–66, Cl. 123—32.

Bernstein, Allan C., to Executone Inc. Volume control circuit. 3,271,519, 9–6–66, Cl. 179—1.

Bernstein, Jack, and E. R. Spitzmiller, to E. R. Squibb & Sons, Inc. Pyrido-quinazoline derivatives. 3,271,396, 9–6–66, Cl. 260—251.

Bernstein, Jack, and E. R. Spitzmiller, to E. R. Squibb & Sons, Inc. Pyrroloquinazoline derivatives. 3,271,400, 9–6–66, Cl. 260—256.4.

Berry, Jim S., and W. I. Lyness, to The Procter & Gamble Co. Sulfoxide detergent. 3,271,318, 9–6–66, Cl. 252—138.

Berthelsen, Calvin R. and O. W., to Century Mfg. Co. Sectional wheel chair assembly. 3,270,353, 9–6–66, Cl. 5—81.

Berthelsen, Owen W.: *See*—
Berthelsen, Calvin R. and O. W. 3,270,353.

Bertin, Daniel, and J. Perronnet, to Roussel-UCLAF, S.A. Process for the preparation of W-(Δ⁴-androstene-16β-ol-3-one-16β-yl) propionic acid and intermediates formed therein. 3,271,391, 9–6–66, Cl. 260—239.55.

Bescher, Ralph H., to Koppers Co., Inc. Method of adding fire retardant chemicals to a fiber board while on the forming wire. 3,271,238, 9–6–66, Cl. 162—159.

Besozzi, Alfio J.: *See*—
Brill, William F., and Besozzi. 3,271,459.

Beste, Hermann, A. Koenig, G. Ryhiner, and E. Voss, to Varta Aktiengesellschaft. Solid acid storage battery electrolyte. 3,271,199, 9–6–66, Cl. 136—157.

Betz Laboratories, Inc.: *See*—
Gonzalez, Gerardo A. 3,271,295.
Gonzalez, Gerardo A. 3,271,296.

Bewley, Thomas, and M. D. Cooke, to Distillers Co. Ltd. Process for the production of phenol. 3,271,457, 9–6–66, Cl. 260—593.

Bezemek, James L. Wear indicating arrangement for vehicle power transfer devices. 3,271,737, 9–6–66, Cl. 340—52.

Bhola, Siri R., to Monsanto Co. Seed crystals and methods using the same. 3,271,118, 9–6–66, Cl. 23—301.

Bidlack, Richard H.: *See*—
Allen, Theodore E., Baker, and Bidlack. 3,271,524.

Biella Shrunk Process, S.A.S., and Moers, Gerhard Maschinenfabrik: *See*—
Alberto, Pietro, and Moers. 3,270,429.

Biggar, Allan M., and M. Apstein, to United States of America, Army. Variable capacitor. 3,271,641, 9–6–66, Cl. 317—249.

Bindel, Fred C.: *See*—
Montague, Ernest R. 3,270,993.

Birrell, Kirk E., R. E. Esch, and J. M. Stemple, to The Sheffield Corp. Positioning device. 3,270,423, 9–6–66, Cl. 33—174.

Bishop, Laurence R., to Watney Combe Reid & Co. Ltd. Process for segregating lupulin from dried hopo. 3,271,162, 9–6–66, Cl. 99—50.5.

Bissett-Berman Corp., The: *See*—
Brown, Neil L. 3,271,694.

Bitterli, Peter, to Sandoz Ltd. Reactive anthraquinone dyes containing a trichloropyrimidyl group. 3,271,397, 9–6–66, Cl. 260—256.5.

Bittle, Harold G.: *See*—
Vogel, Henry A., and Bittle. 3,271,479.

Bjernekull, Bo A. G., to Aktiebolaget Saab. Method of manufacturing hollow bodies having walls of sandwich construction. 3,271,224, 9–6–66, Cl. 156—245.

Blachowski, John A.: *See*—
Hall, Emery L., and Blachowski. 3,270,595.

Black, Rodrick E.: *See*—
Poletika, Nicholas V., and Black. 3,271,184.

Blackman, Ralph B., to Bell Telephone Laboratories, Inc. System for determining the orbital parameters of a terrestrial satellite. 3,271,565, 9–6–66, Cl. 235—152.

Blackmore, Robert C. Projector construction. 3,271,096, 9–6–66, Cl. 352—72.

Blaney, Franklin J., to Golden Anderson Valve Specialty Co., Inc. Oscillatory actuator. 3,270,624, 9–6–66, Cl. 91—418.

Blassnitz, Robert: *See*—
Wieland, Gerhard, and Blassnitz. 3,271,087.

Stephens, William T. 3,270,622.
Arledter, Hanns F., Canfield, and Gillespie. 3,270,846.

Borrini, Geo, to Amut S.p.A. Novara-Veveri. Cooling device for extruded goods of thermoplastic materials. 3,270,806, 9–6–66, Cl. 165—156.

Borth, Paul F., to Photo-Engravers Research, Inc. Process for etching photo-engraving copper. 3,271,282, 9–6–66, Cl. 204—143.

Boscott, Ronald J.: *See*—
Augstein, Joachim, Austin, Green, Hunter, and Boscott. 3,271,448.

Bosko, John L.: *See*—
Bosko, John M. and J. L., and Lindecker. 3,271,044.

Bosko, John M. and J. L., and J. B. Lindecker. Portable workbench for hand table tools. 3,271,044, 9–6–66, Cl. 280—79.3.

Bostian, Logan C., and M. H. Heffner, to Allied Chemical Corp. Manufacture of cellulosic board and novel adhesive system therefor. 3,271,335, 9–6–66, Cl. 260—17.2.

Bostitch Inc.: *See*—
Frappier, Robert H., and O'Rourke. 3,270,630.

Bottenbruch, Ludwig: *See*—
Schnell, Hermann, Krimm, and Bottenbruch. 3,271,367.

Bourns, Inc.: *See*—
Hiuchan, Stephen A., and Hofmann. 3,271,720.

Bowen, G. L., & Co.: *See*—
Bowen, Glen L., and Lemon. 3,270,588.

Bowen, Glen L., and R. W. Lemon, to G. L. Bowen & Co. Multiple speed cooling fan drive mechanism. 3,270,588, 9–6–66, Cl. 74—750.

Bowen, Julian: *See*—
Smith, Kenneth L., Bowen, and Bowker. 3,270,850.

Bower, Harry C., to Chevron Research Co. Method of applying seal coat paving mixtures. 3,270,631, 9–6–66, Cl. 94—23.

Bowling, Joseph E., Jr., and R. A. Murphy, to The Pangborn Corp. Abrasive blasting apparatus. 3,270,464, 9–6–66, Cl. 51—15.

Boyd, David M., Jr., and K. O. Rockey, to Universal Oil Products Co. Method and apparatus for boron trihalide analysis. 3,271,111, 9–6–66, Cl. 23—230.

Boye Needle Co., The: *See*—
Briggs, George E. 3,270,891.

Boykin, Otis F., to CTS Corp. Electrical resistance element and method of making the same. 3,271,193, 9–6–66, Cl. 117—227.

Boyne Products, Inc.: *See*—
Winogrocki, Ray F., and Stoi. 3,271,531.

Brace, Neal O., to E. I. du Pont de Nemours and Co. Process for preparing fluoroalkyl substituted aromatic compounds. 3,271,441, 9–6–66, Cl. 260—476.

Bradbury, Farel. Fluid-powered linear actuators. 3,270,626, 9–6–66, Cl. 92—113.

Bradley, William E., to Philco Corp. Frequency converter employing molecular conversion medium. 3,271,687, 9–6–66, Cl. 325—448.

Bradshaw, Harry O., to Tube Products Ltd. Rotary electric transformers for tube welding. 3,271,712, 9–6–66, Cl. 336—82.

Brakmaster Corp.: *See*—
George, Robert H. 3,271,084.

Bratt, Sven-Ake, to Atlas Copco Aktiebolag. Pneumatic tool having exhaust noise reducing means. 3,270,834, 9–6–66, Cl. 181—36.

Bratsler, Karl, to Metallgesellschaft Aktiengesellschaft. Method of producing hydrogen. 3,271,110, 9–6–66, Cl. 23—213.

Braunholtz, John T.: *See*—
Cremlyn, Richard J. C.-D., Elias, Geoghegan, and Braunholtz. 3,271,245.

Breault, Ernest R. Trash bin with fork arm latching dogs. 3,270,902, 9–6–66, Cl. 214—302.

Bremer, Allen R., to The Boeing Co. Dual valve, dual element fluid filter assembly. 3,270,884, 9–6–66, Cl. 210—90.

Bremer, John W., and V. L. Newhouse, to General Electric Co. Cryogenic electronic memory unit. 3,271,592, 9–6–66, Cl. 307—88.5.

Breneman, Edwin J.: *See*—
Bartleson, Christian J., Breneman, and MacAdam. 3,270,451.

Brennan, Francis P. Dexterous hanger bar and container. 3,270,865, 9–6–66, Cl. 206—7.

Brenner, Robert A., C. A. Cobb, and C. A. Orr, to Whirlpool Corp. Control for wringer rolls. 3,270,533, 9–6–66, Cl. 68—244.

Breverman, David, to Mark-Fast Marking System, Inc. Stencil with barrier layer between the stencil and the adhesive. 3,270,666, 9–6–66, Cl. 101—128.2.

Brevets Aero-Mechaniques S.A.: *See*—
Guerne, William. 3,270,670.

Brian, Kleber D., B. Jones, and H. A. O'Neal, ¼ to L. M. Clark. Sizing, grading and sorting device for thin skin vegetables or fruits. 3,270,880, 9–6–66, Cl. 209—73.

Bridenstine, Orville J., and W. A. Keene, to Phillips Petroleum Co. Nestable and stackable container. 3,270,913, 9–6–66, Cl. 220—97.

Brieger, Louis C., and H. R. Barta, to The Atlantic Refining Co. Stake on contact. 3,271,724, 9–6–66, Cl. 339—22.

Briggs, George E., to The Boye Needle Co. Display rack with recovery means. 3,270,891, 9–6–66, Cl. 211—59.

Briggs, John D.: *See*—
Cords, Helmuth, Fisher, and Briggs. 3,271,243.

Briggs & Stratton Corp.: *See*—
Harkness, Joseph R. 3,270,732.

Briles, Franklin S.: *See*—
Salter, Larry, and Briles. 3,270,410.

Briles Mfg. Co.: *See*—
Salter, Larry, and Briles. 3,270,410.

Brill, William F., and A. J. Besozzi, to Petro-Tex Chemical Corp. Production of methacrolein. 3,271,459, 9–6–66, Cl. 260—604.

Brillinger, James H., to W. R. Grace & Co. Manufacture of balloons. 3,271,484, 9–6–66, Cl. 264—25.

Brinkel, Edwin P.: *See*—
Huntington, Andrew B., Abbott, and Brinkel. 3,270,625.

Brinkerhoff, Jesse R., to The Boeing Co. Electromechanical transducers. 3,271,596, 9–6–66, Cl. 310—8.7.

Bristol-Myers Co.: *See*—
Johnson, David A., and Hardcastle. 3,271,389.
Johnson, David A. 3,271,409.
Price, Kenneth E., and Schmitz. 3,271,253.

British Drug Houses, Ltd.: *See*—
Petrow, Vladimir, Burgess, and Feather. 3,271,427.

British Petroleum Co. Ltd., The: *See*—
Laine, Bernard M., and Filosa. 3,271,266.

British Titan Products Co. Ltd.: *See*—
Groves, James D. 3,271,132.

Brittain, John B.: *See*—
Dyer, Tom L., Jr., Osmundsen, Innis, Whitehead, and Brittain. 3,271,623.

Brondyke, Willis F., to E. I. du Pont de Nemours and Co. Apparatus for melting plastic powder. 3,271,017, 9–6–66, Cl. 263—7.

Brown, Bernard B.: *See*—
Clegg, John M., and Brown. 3,271,249.

Brown, Dennis C., and E. W. Dickson, to Associated Engineering Ltd. Method of making a tool for electrochemical machining. 3,271,281, 9–6–66, Cl. 204—143.

Brown, Edwin C., and G. Woolman, to Baldwin-Lima-Hamilton Corp. Load handling vehicle. 3,270,899, 9–6–66, Cl. 214—75.

Brown, Neil L., to The Bissett-Berman Corp. Variable frequency phase shift oscillator. 3,271,694, 9–6–66, Cl. 331—66.

Brown, Richard J., and R. G. Schnick. Transistorized circuit condition warning device for vehicles. 3,271,736, 9–6–66, Cl. 340—52.

Brundige, William L., to Westinghouse Electric Corp. Method and apparatus for forming and attaching filament support members. 3,270,781, 9–6–66, Cl. 140—71.5.

Brunet, Louis, to Z.R.C.-Zuccolo, Rochet & Co. Watch strap. 3,270,928, 9–6–66, Cl. 224—4.

Brunnee, Curt, to Atlas mess- und Analysentechnik G.m.b.H. Closable inlet devices for admitting gas into high vacuum containers. 3,270,773, 9–6–66, Cl. 137—561.

Buchanan, Lee M., to United States of America, Army. Liquid disseminator. 3,271,103, 9–6–66, Cl. 21—92.

Bucher, Charles A., Jr., to Avco Corp. Doppler-shift corrector for single sideband communications systems. 3,271,682, 9–6–66, Cl. 325—65.

Budd, Larry J., to Pallet Devices, Inc. Method of manufacture of plant shipper and shelter. 3,270,627, 9–6–66, Cl. 93—1.

Budzien, Hugo F.: *See*—
Veneman, Dirk J., and Budzien. 3,270,664.

Buehler, Alois A., to Ingersoll-Rand Co. Drill pipe handling apparatus. 3,270,823, 9–6–66, Cl. 175—85.

Bulfer, James L.: *See*—
Fowler, Russell, Bulfer, and Ullman. 3,270,999.

Bullard, Carl E.: *See*—
Seymour, Ralph V., and Bullard. 3,270,617.

Bullens, Johannes H., to Metaalindustrie Caja, N.V. Method of making a spoked wheel. 3,270,403, 9–6–66, Cl. 29—159.03.

Burgess, Colin M.: *See*—
Petrow, Vladimir, Burgess, and Feather. 3,271,427.

Burgyan, Aladar, and W. Votava. Gray ceramics containing a calcined mixture of aluminum and vanadium compounds. 3,271,171. 9–6–66, Cl. 106—39.

Burke, Harold J.: *See*—
Crawford, Robert B. P., and Tackett. 3,271,756.

Burkert, George M.: *See*—
Nickerson, John D., and Burkert. 3,271,107.

Burness, Donald M., and M. D. Sterman, to Eastman Kodak Co. Aziridinyl phosphonitrile gelatin hardening agent. 3,271,175, 9–6–66, Cl. 106—125.

Burness, Donald M., to Eastman Kodak Co. Alkylamino-2-hydroxypropyl quaternary ammonium compounds. 3,271,443, 9–6–66, Cl. 260—501.

Burr, Harvey, to Ansconda Wire and Cable Co. Communication cable. 3,271,508, 9–6–66, Cl. 174—113.

Burroughs Corp.: *See*—
Bates, Albert M. 3,271,741.
Ohntrup, Frederick F. 3,270,399.
Okada, Robert H. 3,271,583.

Burroughs Wellcome & Co. (U.S.A.) Inc.: *See*—
Hitchings, George H., and Elion. 3,271,399.

Burrows, David A., to Rex Systems Corp. Servo system indicator-controller. 3,271,538, 9–6–66, Cl. 200—52.

Burshtyn, Bernard. Shoe method of production. 3,270,359, 9–6–66, Cl. 12—142.

Burt, Robert V., to The Procter & Gamble Co. Display package for jars and the like. 3,270,869, 9–6–66, Cl. 206—45.33.

Burt, Robert V., to The Procter & Gamble Co. Display package for bottles and the like. 3,270,870, 9–6–66, Cl. 206—45.33.

Burt, Robert V., to The Procter & Gamble Co. Removable cover for display package. 3,270,875. 9–6–66, Cl. 206—57.

Burt, Robert V., to The Procter & Gamble Co. Display package for collapsible tubes and the like. 3,271,857, 9–6–66, Cl. 206—45.33.

Bush, Vannevar. Hydrofoil craft. 3,270,699, 9–6–66, Cl. 114—66.5.

Bush, Walter M., to Eastman Kodak Co. Coacervate mordant dispersions for acid dyes. 3,271,147, 9–6–66, Cl. 96—29.

Butler, Maurice C., to Kinetics Corp. Rotary switch with vibration resistant resilient displaceable fixed contact structure. 3,271,533, 9–6–66, Cl. 200—9.

CSF-Compagnie Generale de Telegraphie Sans Fil: *See*—
Shroff, Arvind M. 3,271,280.
Verger, Bernard. 3,271,616.

CTS Corp.: *See*—
Boykin, Otis F. 3,271,193.

Cabe, Ray W., and W. C. Sondergard, to Tamer Electronics Industries, Inc. Traffic signal controller. 3,271,734, 9–6–66, Cl. 340—37.

Cagneron, Lucien J., and E. A. Skaradzinski, to Archer-Daniels-Midland Co. Rehydrogenation of hydrogenated fatty acids. 3,271,410, 9–6–66, Cl. 260—409.

Cain, Frank D., Jr.: *See*—
Wilkie, John R., Szostak, Johnson, and Cain. 3,270,470.

Calderwood, Robert H., J. Chottiner, and H. R. Sheppard, Jr., to Westinghouse Electric Corp. Electric insulation for condenser bushings and the like. 3,271,509, 9–6–66, Cl. 174—121.

Caldwell, John R., and E. H. Hill, to Eastman Kodak Co. Acrylic compounds. 3,271,374, 9–6–66, Cl. 260—82.1.

Calhoun, Fredrick L., to Electro Dynamics Corp. Material handling system. 3,270,881, 9–6–66, Cl. 209—74.

Cameron, Joseph E.: *See*—
Nickerson, Franklin G., Jr., and Cameron. 3,271,219.

Cammarata, Peter S., and S. Eich, to G. D. Searle & Co. Amylopectin sulfates. 3,271,388, 9–6–66, Cl. 260—233.5.

Campbell, Robert A. Adjustable-filter cigarette. 3,270,750, 9–6–66, Cl. 131—10.

Canadian Industries: *See*—
Atkins, David N., McCaffrey, and Taylor. 3,270,669.

Canfield, Carl R., Jr.: *See*—
Arledter, Hanns F., Canfield, and Gillespie. 3,270,846.

Canfield, Sheldon A., to Owen-Corning Fiberglas Corp. Method and apparatus for producing bonded fibrous products. 3,271,485, 9–6–66, Cl. 264—26.

Cannell, Lawrence G., to Shell Oil Co. Production of polycyclic compounds. 3,271,438, 9–6–66, Cl. 260—464.

Cantrel, Kenneth E.: *See*—
Reinert, Andrew J., Zuech, and Cantrel. 3,271,247.

Cappel, Philip A.: *See*—
Crawford, Joseph H., and Cappel. 3,271,291.

Cappuccio, Vittorio, A. Bonvicini, and C. Caldo, to Montecatini Societa Generale per l'Industria Mineraria e Chimica. Polyolefin stabilizers comprising esters of thiodiethyleneglycol and hydroxyphenyl benzotriazole. 3,271,339, 9–6–66, Cl. 260—23.

Capriati, Enrico G., and D. T. Oakes, to Monsanto Co. Method for preventing the formation of insoluble iron compounds. 3,271,308, 9–6–66, Cl. 252—8.55.

Caracciolo, Edward A., to Signetics Corp. Electronic package assembly. 3,271,625, 9–6–66, Cl. 317—101.

Carls, William. Solenoid valve construction. 3,270,776, 9–6–66, Cl. 137—625.64.

Carborundum Co., The: *See*—
Rutt, Richard D., and Carlson. 3,271,909.

Carlson, Dwight B.: *See*—
Karlsson, Elof K., Carlson, Van Buskirk, and De Pauw. 3,270,879.

Carpenter, Keith H., to General Motors Corp. Accessory drive mechanism. 3,270,509, 9–6–66, Cl. 60—54.

Carrier Corp.: *See*—
Clark, William E. 3,270,517.
McNeely, Lowell A. 3,270,516.
McNeely, Lowell A. 3,270,522.
McNeely, Lowell A. 3,270,523.
McNeely, Lowell A. 3,270,524.

Carter, Leewood C.: *See*—
Mullen, Edward K., and Carter. 3,271,051.

Carter, Paul R., and L. E. Helwig, to United States Steel Corp. Method of treating galvanized sheet to inhibit staining. 3,271,284, 9–6–66, Cl. 204—145.

Caruso, Gerard P., to Shell Oil Co. Grease compositions. 3,271,309, 9–6–66, Cl. 252—21.

Cassel, Thomas R., to General Motors Corp. Exhaust system hanger. 3,270,992, 9–6–66, Cl. 248—60.

Castor, Donald J.: *See*—
Hawkins, Thane E., and Castor. 3,270,603.

Castro, Peter S., and F. F. Stucki, to Lockheed Aircraft Corp. Thin film field sensor. 3,271,665, 9–6–66, Cl. 324—43.

Caterpillar Tractor Co.: *See*—
Connor, Donald H. 3,270,495.
Klingaman, Dean C., and La Grow. 3,271,078.

Cattaneo, Jean-Pierre, to Rexall Drug and Chemical Co. Method for fabricating tubes. 3,271,490, 9–6–66, Cl. 264—92.

Caveny, Leonard H., to Thiokol Chemical Corp. Critical condition indicator. 3,270,560, 9–6–66, Cl. 73—344.

Caywood, Stanley W., Jr., to E. I. du Pont de Nemours and Co. Method of removing coordination catalyst residues from hydrocarbon polymer slurries with alcohol. 3,271,372, 9–6–66, Cl. 260—80.5.

Cello Chemical Co., The: *See*—
Okun, Nathaniel N. 3,270,361.

Celmer, Walter D., to Chas. Pfizer & Co., Inc. 3-cyclohexene-1-glyoxylic acid, salts and esters. 3,271,439, 9–6–66, Cl. 260—468.

Cenitch, Eugene, J. E. Lundberg, and R. A. Watson, to International Business Machines Corp. Inertial sensor. 3,270,566, 9–6–66, Cl. 74—5.6.

Centre Experimental de Recherches et d'Etudes du Batiment et des T.P.: *See*—
Debiton, Etienne C. 3,270,469.

Century Mfg. Co.: *See*—
Berthelsen, Calvin R. and O. W. 3,270,353.

Chaikin, Malcolm, and A. Samson, to Unisearch Ltd. Device for treating a mass of loose fibers. 3,270,532, 9–6–66, Cl. 68—45.

Chalk, Alan J., and J. F. Harrod, to General Electric Co. Process for reaction of silanic hydrogen with unsaturated organic compounds. 3,271,362, 9–6–66, Cl. 260—46.5.

Chamberlain Corp.: *See*—
Andreassen, Alfred E. O. 3,270,404.

Chambers, Worthy L., and J. A. Wright, to Sunbeam Corp. Mixer. 3,271,013, 9–6–66, Cl. 259—131.

Champoux, Roger L.: *See*—
McLeod, John W., and Champoux. 3,270,797.

Charlson, Lynn L., to Germane Corp. Rotary fluid pressure device. 3,270,681, 9–6–66, Cl. 103—130.

Charlson, Lynn L., to Germane Corp. Rotary fluid pressure device. 3,270,682, 9–6–66, Cl. 103—130.

Char-Lynn Co.: *See*—

Conix, Andre J., and L. M. Dohmen, to Gevaert Photo-Producten, N.V. Process of preparing polycarbonates. 3,271,364, 9–6–66, Cl. 260—47.
Conklin, George E.: *See*—
MacRitchie, Arthur L., and Conklin. 3,270,547.
Connally, Carl, Jr., and F. R. Scauzillo, to Mobil Oil Corp. Miscible displacement procedure using a water bank. 3,270,809, 9–6–66, Cl. 166—9.
Connecticut Technical Corp.: *See*—
Esakov, Daniel A., Hilderbrandt. 3,271,670.
Connel, Arlan M.: *See*—
Sand, Darrel R., and Connell. 3,270,679.
Connor, Donald H., to Caterpillar Tractor Co. Apparatus for controlling speed and vibration of engine turbochargers. 3,270,495, 9–6–66, Cl. 60—13.
Consolidation Coal Co.: *See*—
Poundstone, William N. 3,270,577.
Continental Can Co., Inc.: *See*—
Baker, Theodore C. 3,270,944.
Foster, Charles N., McElroy, and Curry. 3,270,904.
Continental Oil Co.: *See*—
McCabe, Leo J. 3,271,315.
Continental-Wirt Electronics Corp.: *See*—
Vananzi, Joseph M. 3,271,535.
Control Data Corp.: *See*—
Rabinow, Jacob. 3,271,740.
Controls Co. of America: *See*—
Behrens, Otto R. 3,271,876.
Guenther, Robert F., Jr., and Martin. 3,271,877.
Martin, Ronald G. 3,271,878.
Converters Inc.: *See*—
Welch, Archibald H. 3,270,629.
Cook, Denys, and D. M. Young, to The Dow Chemical Co. Process for separating methylamines. 3,271,455, 9–6–66, Cl. 260—583.
Cook, George L., Sr., and R. H. Bloom, to Julian B. Rozier. Fish scaling device. 3,270,368, 9–6–66, Cl. 17—7.
Cook, Harold L., Jr.: *See*—
Kehn, Harold B., Sze, and Coo. 3,270,700.
Cook, Loren, to Loren Cook Co. Ventilator with air discharge means. 3,270,656, 9–6–66, Cl. 98—43.
Cook, Loren, Co.: *See*—
Cook, Loren. 3,270,656.
Cook, Lovedu, and V. N. Farhi. Apparatus for selectively treating hair. 3,270,733, 9–6–66, Cl. 132—9.
Cooke, Maurice D.: *See*—
Bewley, Thomas, and Cooke. 3,271,457.
Coover, Harry W., Jr., and R. L. McConnell, to Eastman Kodak Co. Method for producing polymers derived from phosphite and glycols. 3,271,329, 9–6–66, Cl. 260—2.
Cope, Paul E., and C. R. Specter, to The Procter & Gamble Co. Carton. 3,270,942, 9–6–66, Cl. 229—17.
Coope, Robert L. Micrometer caliper. 3,270,422, 9–6–66, Cl. 33—165.
Coover, Harry W., Jr.: *See*—
Shearer, Newton H., Jr., Guillet, and Coover. 3,271,340.
Coran, Aubert Y., and C. E. Anagnostopoulos, to Monsanto Co. Polyolefins containing di(substituted phenyl) oxalates or carbonates as stabilizers. 3,271,358, 9–6–66, Cl. 260—45.85.
Corbell, Paul I., to Johnson Service Co. Monitoring system. 3,271,754, 9–6–66, Cl. 340—258.
Corde de Parle, Inc.: *See*—
Cuozzi, Concetta. 3,270,748.
Cords, Helmuth, R. A. Fisher, and J. D. Briggs, to International Minerals & Chemical Corp. Stable concentrated bacterial insecticide suspensions. 3,271,243, 9–6–66, Cl. 167—22.
Cornell-Dubilier Electric Corp.: *See*—
Sheehan, Joseph P. 3,271,221.
Corning Glass Works: *See*—
Jenkins, Weston H. 3,271,126.
Langdon, Richard H. 3,270,447.
Lipp, George D. 3,271,125.
Cossaart, Raleigh J., to Westinghouse Electric Corp. Electrical inductive apparatus having means to prevent contamination. 3,271,714, 9–6–66, Cl. 336—90.
Costa, Abraham F. Bandage holder. 3,270,742, 9–6–66, Cl. 128—171.
Cotton, John L., to General Motors Corp. Valve tappet. 3,270,726, 9–6–66, Cl. 123—90.
Coulter Electronics, Inc.: *See*—
Coulter, Wallace H. 3,271,671.
Henderson, Michael I. 3,271,672.
Coulter, Wallace H., to Coulter Electronics, Inc. Particle analyzing device. 3,271,671, 9–6–66, Cl. 324—71.
Cowell, Thomas E.: *See*—
Webb, James E. 3,270,501.
Cox, Clifford B.: *See*—
Valdespino, Joe M., and Cox. 3,271,304.
Crabill, Norman L., and J. M. Riebe, to United States of America, National Aeronautics and Space Administration. Control system for rocket vehicles. 3,270,505, 9–6–66, Cl. 60—35.55.
Craft, John L., and W. B. Strohm, to International Business Machines Corp. Analytic bounds detector. 3,271,743, 9–6–66, Cl. 340—172.5.
Crago, Richard A., J. H. Downing, and H. S. Redline, to Union Carbide Corp. Process for the production of low sulfur ferrochromium. 3,271,139, 9–6–66, Cl. 75—130.5.
Crampton, William M., to Honeywell Inc. Control apparatus. 3,270,567, 9–6–66, Cl. 74—5.6.
Crane Co.: *See*—
La Monica, James A. 3,270,678.
Crawford, Joseph H., and W. H. Peters, to General Electric Co. Electrolytic drilling and tapping apparatus. 3,271,288, 9–6–66, Cl. 204—212.
Crawford, Joseph H., and P. A. Cappel, to General Electric Co. Electrochemical machining apparatus with electrolyte flow control means. 3,271,291, 9–6–66, Cl. 204—224.
Crawford, Robert B. P., and D. B. Tackett, to Harold J. Burke. Method and apparatus for detecting a hazardous condition. 3,271,756, 9–6–66, Cl. 340—237.
Cremlyn, Richard J. C.-D., R. S. Elias, M. J. A. Geoghegan, and J. T. Braunholtz, to Imperial Chemical Industries Ltd. N-trichloromethylthiohydantoins for fungicidal compositions and methods. 3,271,245, 9–6–66, Cl. 167—33.
Crowe, James W., to International Business Machines Corp. Superconductive devices. 3,271,585, 9–6–66, Cl. 307—88.5.
Crucible Steel Co. of America: *See*—
Vordahl, Milton B. 3,270,412.
Crumly, Charles B.: *See*—
Adler, Robert, Crumly, Foster, and Lindley. 3,271,731.
Crump, Woodford J.: *See*—
Dellett, Harold W., and Crump. 3,271,505.
Csendes, Ernest, to E. I. du Pont de Nemours and Co. 2,5-di-tert-butyl-N,N'-diaryl-p-phenylene-diamines. 3,271,453, 9–6–66, Cl. 260—576.
Cubberly, Walter E., Jr., to Schlumberger Well Surveying Corp. Acoustic well logging device. 3,271,733, 9–6–66, Cl. 340—17.
Cummins, William F., Sr. Dough cutting and forming device. 3,270,692, 9–6–66, Cl. 107—68.
Cundall, Lincoln A.: *See*—
Staehle, Henry C., Cundall, Horton, and Freller. 3,271,226.
Cuozzi, Concetta. Foundation garment. 3,270,747, 9–6–66, Cl. 128—528.
Cuozzi, Concetta, to Corde de Parle, Inc. Foundation garment. 3,270,748 9–6–66, Cl. 128—528.
Cutler-Hammer, Inc.: *See*—
Reed, Reginald A., and Warner. 3,270,861.
Cyba, Henryk A., to Universal Oil Products Co. Stabilization of organic substances. 3,271,312, 9–6–66, Cl. 252—46.7.

Czech, Clifford F., to McGraw-Edison Co. Dry cleaning machine. 3,270,530, 9–6–66, Cl. 68—18.
Czech, Clifford, to McGraw-Edison Co. Dry cleaning machine. 3,270,531, 9–6–66, Cl. 68—18.
Czerlinsky, Ernst R., to United States of America, Air Force. Method of determining the dielectric constant of irregularly shaped crystals. 3,271,667, 9–6–66, Cl. 324—58.
Dahlberg, Reinhard, to International Telephone and Telegraph Corp. Method of making masks for vapor deposition of electrodes. 3,271,488, 9–6–66, Cl. 264—81.
Daimler-Benz Aktiengesellschaft: *See*—
Ehrhardt, Richard. 3,270,720.
Gassmann, Johannes, and Ehrhardt. 3,270,717.
Gassmann, Johannes. 3,270,718.
Strifler, Paul E. 3,271,047.
D'Alelio, Gaetano F., to Dal Mon Research Co. Polymerizable triazines and products thereof. 3,271,478, 9–6–66, Cl. 260—898.
Dal Mon Research Co.: *See*—
D'Alelio, Gaetano F. 3,271,478.
Daly, Paul J., and J. F. Clark, to United States of America, Air Force. Electronic signal analyzer for a series of successive pulses. 3,271,678, 9–6–66, Cl. 324—121.
Damm, Daniel A., to Owens-Illinois Inc. Implosion resistant cathode ray tube with integral mounting elements to facilitate installation. 3,271,516, 9–6–66, Cl. 178—7.8.
Dana Corp.: *See*—
Wagner, Robert W. 3,270,580.
Daniels, Paul J.: *See*—
Goodrich, Eugene E., Daniels, Burch, and Wilkinson. 3,270,918.
Daniels, Wiley E., to General Aniline & Film Corp. Process of polymerizing acetylene and derivatives thereof. 3,271,378, 9–6–66, Cl. 260—91.3.
Dannels, Bobby F.: *See*—
Kujawa, Francis M., Shepard, and Dannels. 3,271,481.
Dan River Mills Inc.: *See*—
Allen, Thomas C., and Watson. 3,271,305.

Dargan, Douglas S. W.: *See*—
Warson, Henry, and Dargan. 3,271,336.
Darre, Allan: *See*—
Von Sander, Dieter, Suckfüll, and Darre. 3,271,521.
Dart, Peter W.: *See*—
Fogelberg, Clement V., and Dart. 3,271,489.
Daubenspeck, Benjamin K., and E. A. Rickey, to Remington Arms Co., Inc. Cartridge wad and process for the manufacture thereof. 3,270,671, 9–6–66, Cl. 102—95.
Davenport, Alvan F. Driver training apparatus. 3,270,439, 9–6–66, Cl. 35—11.
Davidoff, Charles. Gold recovery process using an alkali metal hydrosulfite with a water soluble oxygen containing compound. 3,271,135, 9–6–66, Cl. 75—106.
Davidoff, Charles. Gold recovery process using an alkali metal hydrosulfite with a water soluble alkali metal alkanoate. 3,271,136, 9–6–66, Cl. 75—118.
Davies, Phineas, and C. M. Stone, to Imperial Chemical Industries Ltd. Catalytic compositions for use in steam reforming of hydrocarbons. 3,271,325, 9–6–66, Cl. 252—466.
Davis, Billy K., to United States of America, National Aeronautics and Space Administration. Spectral method for monitoring atmospheric contamination of inert-gas welding shields. 3,271,558, 9–6–66, Cl. 219—131.
Davis, Hugh L., to Chase Products Co. Container processing bath. 3,270,552, 9–6–66, Cl. 73—41.2.
Davis, John R., to United Gas Corp. Magnetic digital recorder. 3,271,777, 9–6–66, Cl. 346—74.
Davis, Richard, to Monsanto Co. Heat treating process. 3,271,207, 9–6–66, Cl. 148—143.
Daw, Nigel W., to Polaroid Corp. Color television method and apparatus employing different sets of target phosphors, one of which luminesces in a single color and another of which luminesces in different colors. 3,271,512, 9–6–66, Cl. 178—5.2.
Dawson, John W., and M. J. Long, to Vanguard Instrument Corp. Data handling and control circuit for liquid scintillation spectrometers. 3,271,574, 9–6–66, Cl. 250—106.
Daytona Thompson Corp.: *See*—
Thompson, Tom H. 3,270,686.
De Angelus, Millet R.: *See*—
Dersch, Fritz, and De Angelus. 3,271,154.
Dearsley, George, to American Machine & Foundry Co. Article assembling apparatus. 3,270,856, 9–6–66, Cl. 198—31.
Debiton, Etienne C., to Centre Experimental de Recherches et d'Etudes du Batiment et des T.P. Expansible, removable ground anchoring device. 3,270,469, 9–6–66, Cl. 52—2.
Debrie, Andre V. L. C. Film-guiding tracks or channels in cinematographic apparatus. 3,271,099, 9–6–66, Cl. 352—224.
Decca Ltd.: *See*—
Phillipson, Alan, Spiller, and Smith. 3,271,483.
Dechantsreiter, Max J., to Harnischfeger Corp. Stacker crane weighting mechanism. 3,270,893, 9–6–66, Cl. 212—2.
Decker, Robert M., and L. J. Gierosky. Remotely applied conductor spacer. 3,271,510, 9–6–66, Cl. 174—146.
De Claire, James H., to General Motors Corp. Power operated parking brake having an automatic transmission control gear shift release. 3,270,840, 9–6–66. Cl. 192—4.
Decoulos, John J. Lapping machines. 3,270,465, 9–6–66, Cl. 51—98.
Deere & Co.: *See*—
Ackley, John W. 3,270,966.
Obadal, Richard D., and Johnson. 3,270,462.
Rohweder, Glen W. 3,270,489.
Wilkes, Raymond S., Klonda, Henningsen, and Skromme. 3,270,837.
Wood, Keith E. 3,271,082.
Deering Milliken Research Corp.: *See*—
Ingham, Robert M., Jr., Klein, and Putnam. 3,270,397.
Kuhn, Hans H., Bolinger, and Habib. 3,271,342.
Deffrenne, Paul, to Mecanorga S.A. Device for maintaining constant the distance between adjacent surfaces of a reference body and a movable body subject to a variable external force. 3,271,086, 9–6–66, Cl. 308—5.
Deibel, Joseph L.: *See*—
Gewartowski, Richard S., and Deibel. 3,271,663.
Deibig, Heinrich: *See*—
Kern, Werner, Jaacks, and Deibig. 3,271,869.
De Joux, Jean V.: *See*—
De Montremy, Jean, and De Joux. 3,271,097.
Dekker, Frank, to Minnesota Mining and Mfg. Co. Air-cushioned tape guide. 3,270,933, 9–6–66, Cl. 226—97.
Dekker, Frank, to Minnesota Mining and Mfg. Co. Tape transport mechanism for multiple tape widths. 3,270,973, 9–6–66, Cl. 242—55.12.
Delacretaz, Richard E., and S. P. Nemphos, to Monsanto Co. Molecular weight regulation in polymerization of vinylidene monomers using heterocyclic compounds as regulators. 3,271,375, 9–6–66, Cl. 260—85.5.
De Langen, Lambertus H., to American Enka Corp. Apparatus for twisting yarn. 3,270,491, 9–6–66, Cl. 57—77.45.
Delaune, Elaine T., and J. C. Winkler, to Esso Research and Engineering Co. Oxygenated organic compounds of improved odor. 3,271,456, 9–6–66, Cl. 260—593.
Delcron Products Inc.: *See*—
Tucker, Richard C. 3,270,751.
D'Elia, Anthony N., and E. M. Stolarz. Sign with interchangeable characters. 3,270,452, 9–6–66, Cl. 40—140.
Dellett, Harold W., and W. J. Crump, to A. T. I. Industries, Inc. Cable splice case. 3,271,505, 9–6–66, Cl. 174—21.
De Ment, Jack. Chemically pumped laser using chemical cartridge for laser pumping. 3,271,696, 9–6–66, Cl. 331—94.5.
Demeter, Joseph J.: *See*—
Forney, Albert J., and Demeter. 3,271,326.
Demler, Henry W., and G. W. Ziegler, Jr., to AMP Inc. Coaxial connector tool. 3,270,392, 9–6–66, Cl. 29—33.
De Montremy, Jean, and J. V. De Joux. Methods and apparatus for making animated cartoons. 3,271,097, 9–6–66, Cl. 352—133.
Denig, Fred, to Koppers Co., Inc. Method and apparatus for treating gases. 3,271,130, 9–6–66, Cl. 75—60.
Dennis, Emery W., and A. Arnold, to Sterling Drug Inc. Feed compositions containing sodium N-glycolylarsanilate and method of use. 3,271,159, 9–6–66, Cl. 99—2.
Dennis, Ralph E., and R. A. Bolin. Hanger. 3,270,892, 9–6–66, Cl. 211—113.
Dentists' Supply Co. of New York, The: *See*—
Stram, George H. 3,270,417.
Derham, Leslie J., to The National Smelting Co. Ltd. Extraction of zinc. 3,271,184, 9–6–66, Cl. 75—87.
De Ridder, Ernst J., to Reynolds Metals Co. Hydraulic actuator and locking mechanism. 3,270,621, 9–6–66, Cl. 91—44.
Derler, Charles J., and M. J. Applegate, to Jackson Vibrators, Inc. Railway track grading apparatus. 3,270,690, 9–6–66, Cl. 104—7.
De Rosa, Andrew C., to United States of America, Army. Data transmission. 3,271,517, 9–6–66, Cl. 178—26.
Dersch, Fritz, and M. R. DeAngelus, to General Aniline & Film Corp. Antifogging and stabilising agents for photography. 3,271,154, 9–6–66, Cl. 96—66.
Deutsche Gold-und Silber-Scheideanstalt vormals Roesseler: *See*—
Kern, Werner, Schuls, and Lofund. 3,271,334.

Fowler, Peter H.: *See*—
Malagodi, Robert F., and Fowler. 3,271,622.

Fowler, Russell, J. L. Bulfer, and L. L. Ullman, to Thiokol Chemical Corp. Segmented core for molding a cavity in a cast solid propellant rocket motor. 3,270,999, 9–6–66, Cl. 249—61.

Fowler, Seeber T. Plant protector. 3,270,461, 9–6–66, Cl. 47—2.

Fox, Leonard N.: *See*—
Smith, Paul A., and Fox. 3,270,508.

Fox, Sherwood N., and M. B. Sherwin, to Halcon International, Inc. Distillation process for recovering anhydrous hydrogen fluoride. 3,271,273, 9–6–66, Cl. 203—12.

Frame, Alexander G., H. F. Parker, J. Stacey, and P. L. Riley, to United Kingdom Atomic Energy Authority. Nuclear reactor with improved fuel handling apparatus. 3,271,263, 9–6–66, Cl. 176—30.

Frangatos, Gerrassimos, to Mobil Oil Corp. Preparation of benzofuran, benzothiophene, and indoles. 3,271,414, 9–6–66, Cl. 260—319.1.

Frangos, John, and M. Schwarz, to Revlon, Inc. Aerosol dispensing apparatus. 3,270,919, 9–6–66, Cl. 222—82.

Frank, Hermann: *See*—
Riedl, Hans-Joachim, Frank, and Sauermilch. 3,271,212.

Frappier, Robert H., and J. F. O'Rourke, Jr., to Bostitch Inc. Material handling apparatus. 3,270,630, 9–6–66, Cl. 93—93.

Frazier, Thomas J. Propeller for boats. 3,270,820, 9–6–66, Cl. 170—135.21.

Frazza, Everett J., and L. Rapoport, to American Cyanamid Co. B-cyanovinyl thioethers of certain thiazole compound. 3,271,408, 9–6–66, Cl. 260—306.6.

Freche, John C., S. J. Klima, and R. L. Ashbrook, to United States of America, National Aeronautics and Space Administration. High temperature cobalt-base alloy. 3,271,140, 9–6–66, Cl. 75—170.

Freed, Joseph A. Steering wheel turn indicator. 3,270,708, 9–6–66, Cl. 116—31.

Freeman, Eleanor A., and J. L. Walter, to General Electric Co. Process for producing silicon-iron thin tapes. 3,271,202, 9–6–66, Cl. 148—112.

Freitag, Walter O.: *See*—
Di Gullo, Guy, and Freitag. 3,271,276.

Frelier, Harold J.: *See*—
Staehle, Henry C., Cundall, Horton, and Frelier. 3,271,226.

Frey, Robert R., to Richardson-Merrell Inc. Chloroform in hard candy. 3,271,256, 9–6–66, Cl. 167—82.

Fried, Josef, to Squibb & Sons Inc. Sulfurenic acid and derivatives thereof. 3,271,390, 9–6–66, Cl. 260—239.5.

Frisbey, George W., Jr. Fastening device. 3,271,056, 9–6–66, Cl. 287—53.

Frisbie, Lawrence I.: *See*—
Barrett, Robert D., Hamous, Hirakawa, Harnachi, and Frisbie. 3,270,830.

Frost, Emerson L., to United States of America, Army. Generation of coherent millimeter and sub-millimeter wavelength radiation. 3,271,573, 9–6–66, Cl. 250—84.

Fugere, George L., to Westinghouse Electric Corp. Water cooler structure. 3,270,518, 9–6–66, Cl. 62—263.

Fuhrwerk, Victor C., and P. A. Luthman, to Avco Corp. Late opening, early closing gate mechanism for bunk feeder. 3,270,858, 9–6–66, Cl. 198—64.

Fujii, Kiyoshi, S. Imoto, T. Ashikaga, and J. Ukida, to Kurashiki Rayon Co., Ltd. Production of shaped products from solutions of polyvinyl formate in a lower alkyl nitrile. 3,271,494, 9–6–66, Cl. 264—184.

Fujioka, George S., to The Dow Chemical Co. Preparation of lithium hydride. 3,271,108, 9–6–66, Cl. 23—204.

Fujisawa Pharmaceutical Co.: *See*—
Haraoka, Raitaro, and Kamiya. 3,271,398.

Fukurol, Takeo, to Yoshida Kogyo K.K. Lockable sliders for zipper-fasteners. 3,270,535, 9–6–66, Cl. 70—68.

Fuller Co.: *See*—
Richter, Philip, Smith, and Luipersbeck. 3,270,801.

Fullerton, Hodgart & Barclay Ltd.: *See*—
McFadyen, Colin, and Shaw. 3,270,764.

Furth, Harold P., to Advanced Kinetics, Inc. High-current pulse transformer. 3,271,716, 9–6–66, Cl. 336—181.

Furukawa, Mitsuru: *See*—
Ueda, Takeo, Toyoshima, and Furukawa. 3,271,393.

Fyr-Fyter Co., The: *See*—
Kamowski, Frank G. 3,270,768.

Galbreath, Richmond B., to Cities Service Research and Development Co. Hydrogenation process. 3,271,301, 9–6–66, Cl. 208—143.

Galiano, Francis R.: *See*—
Mantell, Gerald J., Rankin, and Galiano. 3,271,377.

Gandler, John C. C., to American Home Products Corp. System for collecting urine from pregnant mares. 3,270,714, 9–6–66, Cl. 119—95.

Gardner, Floyd M., to United States of America, Air Force. Multivibrator with starting circuit. 3,271,697, 9–6–66, Cl. 331—113.

Garashi, Isoji: *See*—
Maehara, Shigeru, and Garashi. 3,271,129.

Grudoski, Daniel P. to Blazon, Inc. Airglide suspension device. 3,271,029, 9–6–66, Cl. 272—87.

Grussner, Andre, and O. Schnider, to Hoffmann-La Roche Inc. 2,4-dialkoxy-5,6-hydrocarbylene-3-nitropyridines. 3,271,403, 9–6–66, Cl. 260—289.

Gschwind, Hans W., and R. H. Huebel, to United States of America, Air Force. Frequency and phase controlled synchronization circuit. 3,271,688, 9–6–66, Cl. 328—55.

Guerne, William, to Brevets Aero-Mecaniques S.A. Impact fuses for spinning explosive projectiles and more particularly to base-detonating fuzes of the type equipped with a mechanical auto-destruction device. 3,270,670, 9–6–66, Cl. 102—79.

Guillet, James E.: *See*—
Shearer, Newton H., Jr., Guillet, and Coover. 3,271,340.

Guin, Joel B. Non-skid tires. 3,270,795, 9–6–66, Cl. 152—211.

Guirl, Howard P. and J. N. Air curtain door seal. 3,270,655, 9–6–66, Cl. 98—36.

Guirl, James N.: *See*—
Guirl, Howard P. and J. N. 3,270,655.

Gulf Oil Corp.: *See*—
Mantell, Gerald J., Rankin, and Galiano. 3,271,377.

Gulf Research & Development Co.: *See*—
Meyer, William K., and Taber. 3,270,811.
Papaila, John. 3,270,817.

Gullich Ltd.: *See*—
Walsh, Donald T. 3,270,510.

Gulliver, Richard F.: *See*—
Hennessey, Russell J., and Gulliver. 3,270,867.

Gurule, Benjamin P. Animated display device. 3,270,446, 9–6–66, Cl. 40—36.

Gutzwiller, Frank W., to General Electric Co. Solid state switching circuits. 3,271,700, 9–6–66, Cl. 332—14.

H. H. Fluorescent Parts, Inc.: *See*—
Eisenhardt, Richard. 3,271,509.

Haake, Claus H., S. T. Workman, and D. L. Johnson, to Giannini Controls Corp. Microwave measurement of surface attrition of a dielectric body. 3,271,668, 9–6–66, Cl. 324—58.5.

Haas, Howard C., and E. M. Idelson, to Polaroid Corp. Phenyl azobenzoyl peroxides. 3,271,384, 9–6–66, Cl. 260—174.

Habib, Emile E.: *See*—
Kuhn, Hans H., Bolinger, and Habib. 3,271,342.

Hackenberg, Ulrich: *See*—
Nerge, Wilhelm, Hackenberg, and Eblers. 3,270,433.

Hackenberg, Ulrich, H. Kamps, and H. Rink, to Leybold Anlagen Holding A.G. Freeze-drying apparatus. 3,270,434, 9–6–66, Cl. 34—92.

Haddix, Robert J.: *See*—
Brown, Charles H., and Haddix. 3,271,006.

Hahnlein, William, to Hamlin Mfg. Co. Adjustable church kneeler. 3,271,074, 9–6–66, Cl. 297—426.

Haines, Robert M., D. L. Klass, and T. W. Martinek, to Union Oil Co. of California. Pump apparatus. 3,270,672, 9–6–66, Cl. 103—1.

Halcon International, Inc.: *See*—
Fox, Sherwood N., and Sherwin. 3,271,273.

Hall, Charles T., to The Molins Organisation, Ltd. Apparatus for packing articles of rectangular block shape in boxes having separate lids. 3,270,486, 9–6–66, Cl. 53—282.

Hall, Emery L., and J. A. Blachowski, to Skil Corp. Offset drive attachment with reversing means. 3,270,595, 9–6–66, Cl. 81—54.

Hall, Emery L., and R. H. Kocian, to Skil Corp. Offset drive attachment for tools having rotary driving members. 3,270,596, 9–6–66, Cl. 81—54.

Hall, Harry D., D. C. Salatin, D. R. Sutherland, and C. J. Teible, to General Motors Corp. Method of die casting. 3,270,383, 9–6–66, Cl. 22—200.

Hall, Marcus A., to Flexible Tubing Corp. Method and apparatus for making indefinite length flexible conduit. 3,271,664, 9–6–66, Cl. 264—93.

Hall, Mitchell A. Coin accumulator. 3,270,848, 9–6–66, Cl. 194—92.

Hall, Walter J., to Sawyers Research Development Corp. Slide changing means. 3,270,445, 9–6–66, Cl. 40—36.

Hallhagen, Rudolf G.: *See*—
Bergstrom, Axel E., Hallhagen, Soderberg, and Westberg. 3,271,504.

Halliburton Co.: *See*—
Moeller, R. E., Love, and Pittman. 3,270,754.
Richardson, Cecil R., Manson, and Baker. 3,270,814.

Hamada, Yoshitsugu, to Yanmar Diesel Engine Co., Ltd. Pressure reducing device for Diesel type rotary engines. 3,270,719, 9–6–66, Cl. 123—8.

Hamilton, George A.: *See*—
Simmons, Harold T., and Hamilton. 3,271,537.

Hamlin Mfg. Co.: *See*—
Hahnlein, William. 3,271,074.

Hammond, Alexander D.: *See*—
Polhamus, Edward C., and Hammond. 3,270,989.

Hammond, Frank E., to Garlock Inc. Pressure-balanced segmental packing rings. 3,271,037, 9–6–66, Cl. 277—27.

Hammond, Joseph P., and K. K. Sinha, to United States of America, Atomic Energy Commission. Method for formulating master alloy compositions for use in dispersion hardened compacts. 3,271,142, 9–6–66, Cl. 75—206.

Hammond, Robert J., to V-M Corp. Transducer element mounting. 3,271,527, 9–6–66, Cl. 179—100.41.

Hamouz, George J.: *See*—
Barrett, Robert D., Hamouz, Frisbie, Hirakawa, and Harnach. 3,270,830.

Hancik, Albin M.: *See*—
Foll, William A., and Hancik. 3,270,778.

Hanes Corp.: *See*—
Stack, Vernon T., and Reavis. 3,270,526.

Hannan, Peter W., and H. A. Wheeler, to Hazeltine Research Inc. Double-reflector, double-feed antenna for crossed polarizations and polarization changing devices useful therein. 3,271,771, 9–6–66, Cl. 343—756.

Hannan, Peter W., to Hazeltine Research Inc. Intercoupling lines for impedance matching of array antennas. 3,271,776, 9–6–66. Cl. 343—777.

Hansen, Poul M. T., and L. Linton-Smith, to Commonwealth Scientific Industrial Research Organization. Powder produced from butter or other edible fats. 3,271,165, 9–6–66, Cl. 99—118.

Hanson, John H. A.: *See*—
Adams, George E., Whale, and Hanson. 3,270,402.

Hanson-Van Winkle-Munning Co.: *See*—
Harper, Willard J., and Hauck. 3,270 855.

Hanson, Wesley T., Jr., to Eastman Kodak Co. Light-sensitive elements for color photography and process therefor. 3,271,152, 9–6–66, Cl. 96—56.5.

Harada, Kazuya, and T. Aoyagi, to Toyo Rayon Kabushiki Kaisha. Process of recovering waste synthetic resin material. 3,271,482, 9–6–66, Cl. 264—15.

Haraoka, Raitaro, and T. Kamiya, to Fujisawa Pharmaceutical Co. Orotic acid salt of 4-amino-5-imidazolecarboxamide. 3,271,398, 9–6–66, Cl. 260—256.4.

Harbison-Walker Refractories Co.: *See*—
Leatham, Earl, Pack, and Weaver. 3,271,117.

Hardcastle, Glenn A., Jr.: *See*—
Johnson, David A., and Hardcastle. 3,271,389.

Harkness, Joseph R., to Briggs & Stratton Corp. Spring starter for internal combustion engine. 3,270,732, 9–6–66, Cl. 123—179.

Harnach, Edward C., Jr.: *See*—
Barrett, Robert D., Hamouz, Frisbie, Hirakawa, and Harnach. 3,270,830.

Harner, Donald R., and M. Plaza, to AMP Inc. Magnetic core package. 3,271,747, 9–6–66, Cl. 340—174.

Harnischfeger Corp.: *See*—
Dechantsreiter, Max J. 3,270,893.

Harper, Paul T., to Lockheed Aircraft Corp. Magnetic NOR device. 3,271,581, 9–6–66, Cl. 307—88.

Harper, Thomas P., to International Business Machines Corp. Electronic handwriting detection and display apparatus. 3,271,515, 9–6–66, Cl. 178—6.8.

Harper, Willard J., and P. A. Hauck, to Hanson-Van Winkle-Munning Co. Barrel treatment machine for small articles. 3,270,855, 9–6–66, Cl. 198—19.

Harrell, William A., to E. I. du Pont de Nemours and Co. Guide elements. 3,270,937, 9–6–66, Cl. 226—197.

Harris, Nancy R. Fabric storage device. 3,270,791, 9–6–66, Cl. 150—52.

Harris, Robert E., Jr. Cleat cleaner. 3,270,363, 9–6–66, Cl. 15—237.

Harris, William J., to Lockheed Aircraft Corp. Atmospheric charged particle beam welding. 3,271,556, 9–6–66, Cl. 219—121.

Harrison, Douglas: *See*—
Westerman, Albert, and Harrison. 3,270,967.

Harrod, John F.: *See*—
Chalk, Alan J., and Harrod. 3,271,362.

Harter Corp.: *See*—
Good, Wayne W. 3,271,075.

Hartmann, Horst J., to International Standard Electric Corp. Method of producing electrical semiconductor devices. 3,271,632, 9–6–66, Cl. 317—234.

Hartong, Augustinus L. H., to American Enka Corp. Fused epoxy resin-monoamine compound as processing aid in pigmented nylon. 3,271,348, 9–6–66, Cl. 260—32.6.

Harvey, Robert R., to Phillips Petroleum Co. Method for increasing subterranean formation permeability. 3,270,808, 9–6–66, Cl. 166—9.

Hatfield, Thomas P., and J. E. Squyres. Display and other cases and method of making. 3,271,092, 9–6–66, Cl. 312—311.

Hauck, Paul A.: *See*—
Harper, Willard J., and Hauck. 3,270,855.

Hauni Werke Korber & Co., KG.: *See*—
Schubert, Bernhard. 3,270,601.

Hawkins, Thane E., and D. J. Castor, to Talon, Inc. Tube cutting mechanism. 3,270 603, 9–6–66, Cl. 83—127.

Hawley, Wilbur W., D. H. Geipel, and W. D. Longyear, to National Aeronautics and Space Administration. Omnidirectional acceleration device. 3,270,565, 9–6–66, Cl. 73—497.

Hayes, James R., and A. H. Neal, to Esso Research and Engineering Co. Selective dehydration of secondary alcohol over 5-A sieve. 3,271,464, 9–6–66, Cl. 260—643.

Hazeltine Research Inc.: *See*—
Hannan, Peter W. 3,271,776.
Hannan, Peter W., and Wheeler. 3,271,771.
Wheeler, Harold A. 3,271,778.

Hazelton, Russell F., to Allied Chemical Corp. Apparatus for continuous pyrolysis of liquid materials. 3,271,116, 9–6–66, Cl. 23—284.

Hazzard, Noel D., to Combustion Engineering, Inc. Sealing arrangement for rotary heat exchanger. 3,270,803, 9–6–66, Cl. 165—9.

Heck, Edward E., to Republic Molding Corp. Method of and means for molding plastic parts. 3,271,501, 9–6–66, Cl. 264—319.

Hecker, Hanns E. Package for columnar articles. 3,270,877, 9–6–66, Cl. 206—72.

Heemeyer, Wilhelm, to Klockner-Werke AG. Steel plant. 3,271,020, 9–6–66, Cl. 266—13.

Heffer, James J.: *See*—
Ott, Howard F., and Heffer. 3,271,218.

Heffner, Malcolm H.: *See*—
Bostian, Logan C., and Heffner. 3,271,335.

Heimbach, Paul: *See*—
Wilke, Gunther, and Heimbach. 3,271,468.

Helwig, Lawrence E.: *See*—
Carter, Paul R., and Helwig. 3,271,284.

Henderson, Michael I., to Coulter Electronics, Inc. Particle studying device control circuit. 3,271,672, 9–6–66, Cl. 324—71.

Hendon, Harry H., and L. D. Test, to General Electric Co. Radiation monitor circuit including amplifier. 3,271,691, 9–6–66, Cl. 330—17.

Hennessey, Russell J., and R. F. Gulliver, to Waldorf Paper Products Co. Tube display cartons. 3,270,867, 9–6–66, Cl. 206—45.14.

Henningsen, Etlar A.: *See*—
Wilkes, Raymond S., Klouda, Skromme, and Henningsen. 3,270,857.

Henriksen, Erik K., to Aerojet-General Corp. Explosively actuated tensile testing device. 3,270,556, 9–6–66, Cl. 73—95.

Henry, Jennie. Portfolio coloring kit. 3,271,091 9–6–66, Cl. 312—231.

Hercules Powder Co.: *See*—
Goddu, Robert K. 3,271,337.

Hess, Norman E., and D. L. Larsen, to Mitts & Merrill. Brush chipping machine. 3,270,968, 9–6–66, Cl. 241—186.

Hesse, Heinrich, to Mannesmann-Meer Aktiengesellschaft. Extrusion molding machine. 3,270,372, 9–6–66, Cl. 18—30.

Hettinga, Siebolt. Hand pump. 3,270,687, 9–6–66, Cl. 103—178.

Hewes, Donald E., and A. A. Spady, Jr., to United States of America, National Aeronautics and Space Administration. Reduced gravity simulator. 3,270,441, 9–6–66, Cl. 35—29.

Hewlett-Packard Co.: *See*—
Selsted, Walter T., and Girdner. 3,270,935.
Selsted, Walter T., and Girdner. 3,270,936.

Heywood-Wakefield Co.: *See*—
Smith, William I. 3,271,076.

Hickerson, John E., to International Business Machines Corp. Mechanical calculating apparatus. 3,270,958, 9–6–66, Cl. 235—61.

Hideg, Laszlo, T. M. Sebestyen, and A. O. Simko, to Ford Motor Co. Internal combustion engine combustion chambers. 3,270,721, 9–6–66, Cl. 123—32.

Higuchi, Takashi, to Nippon Kogaku, K.K. Three component zoom lens for photographic cameras. 3,270,615, 9–6–66, Cl. 88—57.

Hilbiber, David F., to Fairchild Camera and Instrument Corp. Reference voltage source. 3,271,660, 9–6–66, Cl. 323—75.

Hill, Edward H.: *See*—
Caldwell, John R., and Hill. 3,271,874.

Hill, Fred N., to Union Carbide Corp. Polymerization of epoxides in the presence of aluminum alkylate as catalyst. 3,271,328, 9–6–66, Cl. 260—2.

Hillman, Joel, H, to Tension Envelope Corp. Mailing piece. 3,270,949, 9–6–66, Cl. 229—92.1.

Hilton, Frank E., to Kwik Lok Corp. Polystyrene multi-closure strip scored for separation into individual closures. 3,270,874, 9–6–66, Cl. 206—56.

Hinds, Virgil A., to Sperry Rand Corp. Character recognition converter. 3,271,586, 9–6–66, Cl. 307—88.5.

Hines, Marion E., and F. P. Collins, to Microwave Associates, Inc. Electric wave frequency multiplier. 3,271,656. 9–6–66, Cl. 321—69.

Hirakawa, James K.: *See*—
Barrett, Robert D., Hamouz, Frisbie, Harnach, and Hirakawa. 3,270,830.

Hirsch, Walter F. Faucet connector. 3,270,767, 9–6–66, Cl. 137—268.

Hirschler, Daniel A., Jr.: *See*—
Stephens, Ruth E., Hirschler, and Lamb. 3,271,324.

Hirsh, Walter F. Automatic key remover. 3,270,539, 9–6–66, Cl. 70—414.

Hirshon, Jack M., and P. D. Warner, to International Resistance Co. Handling and bonding apparatus. 3,271,555, 9–6–66, Cl. 219—85.

Hitchcock, Jack R.: *See*—
Beesley, Albert E., and Hitchcock. 3,271,048.

Hitchings, George H., and G. B. Elion, to Burroughs Wellcome & Co. (U.S.A.) Inc. 5-acyloxyuracils and their preparation. 3,271,399, 9–6–66, Cl. 260—256.4.

Hiyoshi, Suehiro: *See*—
Goda, Susumu, Gondo, Arima, and Hiyoshi. 3,271,206.

Hjo Fabriks AB: *See*—
Stenestam, Arne W., and Schill. 3,270,444.

Hluchan, Stephen A., and W. R. Hofmann, to Bourns, Inc. Corrector for pressure-sensitive diaphragm or capsule. 3,271,720, 9–6–66, Cl. 338—42.

Hobbs, William, Jr., and W. W. Mann, to Sperry Rand Corp. Pneumatic conveyor. 3,271,083, 9–6–66, Cl. 302—50.

Hodder, Wayne K., to Bell & Howell Co. Demodulator for time modulated signals. 3,271,689, 9–6–66, Cl. 329—136.

Hoffman, Paul H., to R. E. Raney and C. F. Clark, as co-trustees. Method of continuously forming reinforced resinous sheet material. 3,271,215, 9–6–66, Cl. 156—62.8.

Hoffmann-La Roche Inc.: *See*—
Fabrni, Peter, Mosimann, and Schnider. 3,271,402.
Grussner, Andre, and Schnider. 3,271,403.

Hofmann, Hugo, to Beaunit Corp. Process of treating synthetic fibers. 3,271,189, 9–6–66, Cl. 117—138.8.

Hofmann, Werner R.: *See*—
Hluchan, Stephen A., and Hofmann. 3,271,720.

Hofmann, Wilfried, and A. Winkler, to Agfa Aktiengesellschaft. Manually settable camera with light-responsive means for aiding in the setting of the camera. 3,270,640, 9–6–66, Cl. 95—10.

Holland, J. H., Co.: *See*—
Holland, John H. 3,270,633.

Holland, John H., to J. H. Holland Co. Universal bituminous paving machine. 3,270,633, 9–6–66, Cl. 94—44.

Holmes, Tracy S. Snap-eye. 3,270,494, 9–6–66, Cl. 59—86.

Holstein & Kappert: *See*—
Bargel, Gunter. 3,270,859.

Kleist, Leroy C., to The Magnavox Co. Film cutter with photocell inspection and stop means. 3,270,599, 9–6–66, Cl. 83—63.

Klem, Stanley J., Jr., and H. F. Nitka, to General Aniline & Film Corp. X-ray film cassette with film feeding means. 3,271,571, 9–6–66, Cl. 250—68.

Klemchuk, Peter, and M. Dexter, to Geigy Chemical Corp. Polyvinyl halide stabilizers comprising sulfur-containing compounds and metal salts of epoxidized fatty acids. 3,271,338, 9–6–66, Cl. 260—23.

Klima, Stanley J.: *See*—
Freche, John C., Klima, and Ashbrook. 3,271,140.

Klimstra, Paul D., to G. D. Searle & Co. Androst-2-ene-5A, 17β-diol, 17-alkyl derivatives corresponding and esters thereof. 3,271,425, 9–6–66, Cl. 260—397.4.

Klingaman, Dean C., and A. C. La Grow, to Caterpillar Tractor Co. Rock wagon. 3,271,078, 9–6–66, Cl. 298—25.

Klinger, Guenther H., to General Aniline & Film Corp. Process for preparing photographic gelatin. 3,271,174, 9–6–66, Cl. 106—125.

Klockner-Werke AG: *See*—
Heemeyer, Wilhelm. 3,271,020.

Klouda, Alvin E.: *See*—
Wilkes, Raymond S., Klouda, Henningsen, and Skromme. 3,270,857.

Knapsack-Griesheim Aktiengesellschaft: *See*—
Ewald, Gert, Zech, and Esser. 3,271,930.

Kneeland, John A.: *See*—
Kopas, George A., and Kneeland. 3,271,160.

Knepper, Dale L. Article loader. 3,270,485, 9–6–66, Cl. 53—255.

Knighton, James B., and R. K. Steunenberg, to United States of America, Atomic Energy Commission. Purification of molten salts. 3,271,133, 9–6–66, Cl. 75—84.1.

Knowlton, Edward A., to United-Carr Inc. Sealed hollow fastener members. 3,270,610, 9–6–66, Cl. 85—32.

Kocian, Richard H.: *See*—
Hall, Emery L., and Kocian. 3,270,596.

Kodaras, Michael J. Impact noise isolation floor construction. 3,270,475, 9–6–66, Cl. 52—480.

Koehler, Gérard, to Société Chouvin Arnoux et Cie. Electromagnetic relay of the bistable type. 3,271,707, 9–6–66, Cl. 200—87.

Koelsch, Lester M., to Beloit Corp. Screen plate for pulp press and the like. 3,270,663, 9–6–66, Cl. 100—117.

Koenig, Alexander: *See*—
Beste, Hermann, Koenig, Ryhiner, and Voss. 3,271,199.

Kohl, John, and G. Pillar, said Pillar assor. to said Kohl. Packing ring and method of making. 3,271,039, 9–6–66, Cl. 277—228.

Kohlhagen, Walter. Oscillating D.C. motor of regulated output torque. 3,271,599, 9–6–66, Cl. 310—36.

Kohn, Harold B., M. C. Sze, H. L. Cook, Jr., H. C. Secord, and O. Arvesen, to Vehoc Corp. Shipboard installation of elongated pressure vessels. 3,270,700, 9–6–66, Cl. 114—74.

Kolb, Ernest D., to Bell Telephone Laboratories, Inc. Crystal growth container. 3,271,114, 9–6–66, Cl. 23—273.

Kolesh, Victor A., and W. E. Lamlein, to Simonds Saw and Steel Co. Shanks for inserted tooth saws and assemblies of same. 3,270,786, 9–6–66, Cl. 143—151.

Kolka, Alfred J.: *See*—
Ecke, George G., and Kolka. 3,271,314.

Kollenitsch, Janos: *See*—
Tishler, Max, Chemerda, and Kollonitsch. 3,271,451.

Koller, Charles R., to E. I. du Pont de Nemours and Co. Production of loop pile textiles. 3,271,216, 9–6–66, Cl. 156—72.

Kollsman, Paul. Ion exchange membranes and spacers and process of making them. 3,271,292, 9–6–66, Cl. 204—263.

Konkoly, Janos: *See*—
Juhasz, Adam, and Konkoly. 3,270,887.

Koos, Milton, Jr., to A. Tamaroff. Oven. 3,270,740, 9–6–66, Cl. 126—275.

Kooyers, Gerald P., to Litton Precision Products, Inc. Depressed collectors for crossed field travelling wave tubes. 3,271,618, 9–6–66, Cl. 315—39.3.

Kopas, George A., and J. A. Kneeland, to Pacific Vegetable Oil Corp. Process for preparing feed from undercorticated oil free safflower seed residue. 3,271,160, 9–6–66, Cl. 99—2.

Koppers Co., Inc.: *See*—
Bescher, Ralph H. 3,271,238.
Denig, Fred. 3,271,130.

Koster, Roland, to Studiengesellschaft Kohle m.b.H. Process for the production of heterocyclic boron compounds. 3,271,436, 9–6–66, Cl. 260—462.

Krajewski, Edward Z., to Litton Precision Products, Inc. Microwave heating apparatus. 3,271,552, 9–6–66, Cl. 219—10.55.

Krajewski, Edward Z.: *See*—
Baker, Berkley J., and Krajewski. 3,271,169.

Kramer, Fritz, to United States of America, National Aeronautics and Space Administration. Device for suppressing sound and heat produced by high-velocity exhaust jets. 3,270,835, 9–6–66, Cl. 181—52.

Krämer, Rudolf, to Siemens & Halske Aktiengesellschaft. Distortion correction of teleprinter symbols. 3,271,518, 9–6–66, Cl. 178—53.1.

Krammer, Robert, to Taylor & Gaskin, Inc. Apparatus for treating structural members. 3,271,008, 9–6–66, Cl. 254—98.

Kraus, Guido: *See*—
Maeder, Edward G., and Kraus. 3,270,544.

Krauss-Maffei A.G.: *See*—
Zoellner, Fritz. 3,270,691.

Krant, Herman G., to The Stanley Works. Method and apparatus for skin packaging articles and packages formed thereby. 3,270,482, 9–6–66, Cl. 53—30.

Kreinberg, Earl R., to Philco Corp. Phase detector and automatic apparatus utilizing said phase detector for preforming a rotational mechanical adjustment to effect a phase coincidence. 3,271,675, 9–6–66, Cl. 324—83.

Krellen, Harry I., to United States of America, Army. Dehumidifying breather system for mobile cargo container. 3,271,089, 9–6–66, Cl. 312—31.

Kresge, Edward N., to Esso Research and Engineering Co. Grafted terpolymers. 3,271,477, 9–6–66, Cl. 260—877.

Kreuz, John A., to E. I. du Pont de Nemours and Co. Preparation of aromatic polyiminolactones. 3,271,366, 9–6–66, Cl. 260—47.

Krewer, William A., and G. W. Ayers, to Union Oil Co. of California. Preparation of chloroalkylated benzenes and alkylsubstituted benzenes. 3,271,465, 9–6–66, Cl. 260—651.

Krimm, Heinrich: *See*—
Schnell, Hermann, Krimm, and Bottenbruch. 3,271,367.

Kroekel, Rolf H. W., to Sealol, Inc. Pressure container. 3,270,905, 9–6–66, Cl. 220—3.

Kroll, Frederick H.: *See*—
Pawelka, Gustav J., and Kroll. 3,271,529.

Kronig, Walter, H.-J. Müller, and K.-H. Vöpel, to Farbenfabriken Bayer Aktiengesellschaft. Recycle of monoolefines to a hydrocarbon pyrolysis process. 3,271,297, 9–6–66, Cl. 208—67.

Kropp, Willis A., to General Time Corp. Rotary oscillatory motion from continuous rotary motion. 3,270,360, 9–6–66, Cl. 15—22.

Kruger, Michael H., to Smithcraft Corp. Light fixture assembly. 3,271,570, 9–6–66, Cl. 240—51.11.

Kubas, Joseph. Stabilized watercraft and stabilizer for minimizing pitching and wave shock of small craft. 3,270,701, 9–6–66, Cl. 114—121.

Kuhn, Hans H., E. D. Bolinger, and E. E. Habib, to Deering Milliken Research Corp. Composition comprising a salt of a styrene-maleic acid copolymer and a polyurethane. 3,271,342, 9–6–66, Cl. 260—29.6.

Kuhner, Max H., to Riley Stoker Corp. Steam generating unit. 3,270,716, 9–6–66, Cl. 122—459.

Kuipers, Heinrich. Vehicle parking system. 3,270,898, 9–6–66, Cl. 214—16.1.

Kujawa, Francis M., A. F. Shepard, and B. F. Dannels, to Hooker Chemical Corp. 2,6-disubstituted primary aryl phosphites and phosphorodi-halidites and processes for the manufacture thereof. 3,271,481, 9–6–66, Cl. 260—980.

Kurachi, Hisaharu. Means for coupling a hose to a pipe. 3,271,053, 9–6–66, Cl. 285—8.

Kurashiki Rayon Co., Ltd.: *See*—
Fujii, Kiyoshi, Imoto, Ashikaga, and Ukida. 3,271,494.

Kuzmick, Paul L. Phonograph stylus and method of making same. 3,271,036, 9–6–66, Cl. 274—38.

Kwik Lok Corp.: *See*—
Hilton, Frank E. 3,270,874.
Rocholl, Hans G. 3,270,481.

Kydd, Paul H., and G. J. Mullaney, to General Electric Co. Composite heat exchanger tube structure. 3,270,780, 9–6–66, Cl. 138—148.

La Badie, William, to Johns-Manville Corp. Method and apparatus for the electrical loosening of the bond between a pipe and a mandrel during the winding of the pipe on the mandrel. 3,271,236, 9–6–66, Cl. 162—122.

Laboratory For Electronics, Inc.: *See*—
Colby, George V., Jr. 3,271,763.

Lachance, Armand A.: *See*—
Lachance, Gerald J. 3,270,454.

Lachance, Armand A. Automatic grocery cart. 3,270,837, 9–6–66, Cl. 186—1.

Lachance, Gerald J., to A. A. Lachance. Pusher handle construction for grocery carts. 3,270,454, 9–6–66, Cl. 40—308.

Lafferty, James M., to General Electric Co. Triggered vacuum discharge device. 3,271,619, 9–6–66, Cl. 315—111.

La Grow, Alfred C.: *See*—
Klingaman, Dean C., and La Grow. 3,271,078.

Laine, Bernard M., and J. A. Filosa, to The British Petroleum Co. Ltd. Process for cultivating microorganisms on a hydrocarbon feedstock employing a carbohydrate pretreatment feedstock. 3,271,266, 9–6–66, Cl. 195—3.

L'Air Liquide: *See*—
Rey, Louis. 3,271,875.

Lakatos, Julius. Trimming apparatus for molded articles. 3,270,415, 9–6–66, Cl. 29—558.

Lamb, Frances W.: *See*—
Stephens, Ruth E., Hirschler, and Lamb. 3,271,324.

Lamb, Jos. F., Co.: *See*—
Kay, John G. 3,270,864.

Lambrech, Joseph A., deceased, by V. G. Lambrech, executrix, to Union Carbide Corp. 5-acenaphthenyl esters of carbamic acid and N-substituted alkyl carbamic acids. 3,271,442, 9–6–66, Cl. 260—479.

Lambrech, Vallah G.: *See*—
Lambrech, Joseph A. 3,271,442.

Lamlein, Walter E.: *See*—
Kolesh, Victor A., and Lamlein. 3,270,786.

La Monica, James A., to Crane Co. Self-priming centrifugal pump. 3,270,678, 9–6–66, Cl. 103—113.

Landis Tool Co.: *See*—
Baisiger, Harold E. 3,271,905.
Rocks, Hugh N. 3,271,908.

Langdon, Richard H., to Corning Glass Works. Display panel. 3,270,447, 9–6–66, Cl. 40—52.

Langenheim, Richard H.: *See*—
Gilchrist, Ralph E., and Langenheim. 3,270,812.

Lansch, John L., to Anaconda Wire and Cable Co. Pipe-type cable controller comprising self-testing features. 3,271,752, 9–6–66, Cl. 340—214.

Lapointe Machine Tool Co.: *See*—
Bonnafe, Oliver W. 3,270,395.

Lara, Carlos C., and E. A. C. Cofino. Continuous operation vegetable matter essence extraction apparatus. 3,270,437, 9–6–66, Cl. 34—168.

Larky, Norbert D., to United States of America, Air Force. Radar tracking. 3,271,767, 9–6–66, Cl. 343—17.1.

Larky, Norbert D., to United States of America, Air Force. Radar tracking system. 3,271,768, 9–6–66, Cl. 343—17.1.

La Rocca, Aldo V., to General Electric Co. Controllable vaporizing gas accelerator. 3,270,498, 9–6–66, Cl. 60—35.5.

Latham, Albert W., and B. Slotnick, to Westinghouse Electric Corp. Supporting means for bearing pads in a thrust bearing assembly. 3,271,088, 9–6–66, Cl. 308—160.

Latham, Albert W.: *See*—
Slotnick, Barney, and Latham. 3,271,607.

Lavin, Edward, and G. E. Mont, to Monsanto Co. Laminated safety glass. 3,271,233, 9–6–66, Cl. 161—199.

Lavin, Edward, and G. E. Mont, to Monsanto Co. Laminated safety glass. 3,271,234, 9–6–66, Cl. 161—199.

Lavin, Edward, G. E. Mont, and A. F. Price, to Monsanto Co. Laminated safety glass. 3,271,235, 9–6–66, Cl. 161—199.

Law, Harold B., to Radio Corp. of America. Color cathode ray tube with index stripes on ultra-violet-emitting phosphor layer. 3,271,610, 9–6–66, Cl. 313—92.

Leach, Charles, to Glasser Products. Electrostatic coating system. 3,270,711, 9–6–66, Cl. 118—627.

Leadbeater, Howard W., to Universal American Corp. Motion control sheave. 3,270,578, 9–6–66, Cl. 74—230.17.

Leatham, Earl, A. H. Pack, and E. P. Weaver, to Harbison-Walker Refractories Co. Apparatus for recovery of magnesium values. 3,271,117, 9–6–66, Cl. 23—287.

Leedom, Marvin A., to Radio Corp. of America. Television tuner. 3,270,571, 9–6–66, Cl. 74—10.41.

Leeds and Northrup Co.: *See*—
Cockrell, James L. 3,271,690.
McFadden, Harold E. 3,271,534.

Leeming-Miles Pharmaceuticals Inc.: *See*—
Gingras, Pierre. 3,270,743.

Lees, Alan B., to Electronic Specialty Co. Antenna phasing control system. 3,271,770, 9–6–66, Cl. 343—100.

Lees, James and Sons Co.: *See*—
Morgan, Harry L. 3,271,102.

Leesona Corp.: *See*—
Oswin, Harry G. 3,271,196.

Leiner, Jerome: *See*—
Lieber, Sidney U., and Leiner. 3,271,572.

Leistensnider, George P., to Johns-Manville Corp. Polyethylene oxide as binders in asbestos packings. 3,271,351, 9–6–66, Cl. 260—37.

Lemieux, Raymond U.: *See*—
Raap, Rintje, Lemieux, and Micetich. 3,271,407.

Lemon, Robert W.: *See*—
Bowen, Glen L., and Lemon. 3,270,588.

Leonard, Merrill G., to Westinghouse Electric Corp. Cooling system for underground transformers. 3,271,710, 9–6–66, Cl. 336—55.

Lepselter, Martin P., to Bell Telephone Laboratories, Inc. Selective removal of material using cathodic sputtering. 3,271,286, 9–6–66, Cl. 204—192.

Leroi, Eugene L.: *See*—
Renault, Jean A., and Leroi. 3,271,248.

Lerwill, William E.: *See*—
Anstey, Nigel A., and Lerwill. 3,271,732.

Le Suer, William M., to The Lubrizol Corp. Metal salts of alkenyl succinic acid. 3,271,310, 9–6–66, Cl. 252—32.7.

Le Valley, Lewis H.: *See*—
Greene, Paul B., Le Valley, Mewhinney, and Nevin. 3,270,969.

Le Vaux, Rene G.: *See*—
Wood, Ernest C. 3,270,745.

Levenson, John J., to General Motors Corp. Method for forming resilient plastic seat elements. 3,270,393, 9–6–66, Cl. 29—91.1.

Lever Bros. Co.: *See*—
Jan Van Leeuwen, Geert, Mijnders, and Boot. 3,271,166.

Levey, Harold A., and E. S. Fonda. Polystyrene methods and products. 3,271,349, 9–6–66, Cl. 260—33.6.

Levine, Seymour D., to E. R. Squibb and Sons Inc. 5β-cyano substituted A-norpregnane and A-norandrostane compounds. 3,271,437, 9–6–66, Cl. 260—464.

Lewis, Thomas E.: *See*—
Staley, John, and Lewis. 3,270,401.

Luoma, Paul E.: *See*—
Otrhalek, Joseph V., and Luoma. 3,271,317.

Lupfer, Dale E., and M. L. Johnson, to Phillips Petroleum Co. Control of internal reflux in a fractional distillation process and system. 3,271,270, 9–6–66, Cl. 202—160.

Lusk, Dudley, to Chicago Bridge & Iron Co. Joint structure. 3,270,910, 9–6–66, Cl. 220—55.

Luscombe, William C.: *See*—
Woofter, Robert C., and Luscombe. 3,270,831.

Luthman, Paul A.: *See*—
Fuhrwerk, Victor C., and Luthman. 3,270,858.

Lyman, Wallace R., to Westinghouse Electric Corp. Vending machine empty signal indicating mechanism. 3,270,916, 9–6–66, Cl. 221—6.

Lynch, Cornelius G.: *See*—
Bowden, J. E., and Lynch. 3,271,929.

Lyness, Warren I.: *See*—
Berry, Jim S., and Lyness. 3,271,318.

Lyons, Ernest H., Jr. Process for producing electricity and furnace. 3,271,197, 9–6–66, Cl. 136—86.

M-O Valve Co. Ltd., The: *See*—
Reddish, Alan, and Ward. 3,271,609.

MacAdam, David L.: *See*—
Bartleson, Christian J., Breneman, and MacAdam. 3,270,-451.

Machan, Antonin, and L. Dubny, to Meopta, Narodni Podnik. Tripod base. 3,270,994, 9–6–66, Cl. 248—187.

Machlett Laboratories, Inc., The: *See*—
Rome, Martin, and Jordan. 3,271,608.

Machota, Frank, ½ to Carmen Di Mascio. Garment holder for pressing machine. 3,270,926, 9–6–66, Cl. 223—70.

MacPherson, Allan. Process of making welt shoes. 3,270,357, 9–6–66, Cl. 12—142.

MacRitchie, Arthur L., and G. E. Conklin, to Esso Research and Engineering Co. Thermocouple calibration system. 3,270,547, 9–6–66, Cl. 73—1.

Maddocks, Fred S.: *See*—
Thun, Rudolf E., and Maddocks. 3,271,192.

Madestau, Larry: *See*—
Spence, Sydney P., Steiner, Richardson, Kaufman, and Madestau. 3,271,470.

Madwed, Albert, to Automatic Casting Corp. Die casting apparatus. 3,270,378, 9–6–66, Cl. 22—70.

Maeder, Edward G., and G. Kraus, to Reynolds Metals Co. Can forming apparatus. 3,270,544, 9–6–66, Cl. 72—346.

Maehara, Shigeru, and I. Garashi, to Yawata Iron & Steel Co., Ltd., and Yokohama Engineering Co., Ltd. Method of recovering an unburnt waste gas produced in oxygen top-blowing converter. 3,271,129, 9–6–66, Cl. 75—60.

Magnaflux Corp.: *See*—
Gewartowski, Richard S., and Deibel. 3,271,663.
Mountz, John M., and Flaherty. 3,271,664.

Magnavox Co., The: *See*—
Kleist, Leroy C. 3,270,599.
Love, Kenneth H. 3,270,600.

Magor, Lincoln S., to Mimik Ltd. Control system. 3,270,619, 9–6–66, Cl. 90—13.5.

Mahony, Harold A. Process of preparing lime and a system including means for providing a hot gas for use in the process. 3,271,015, 9–6–66, Cl. 263—1.

Maichen, Karl. Device for applying cleaning and treating materials. 3,270,366, 9–6–66, Cl. 15—559.

Mailloux, Lawrence J., to Screw Machine Tool Co. Skiving tool holder. 3,270,598, 9–6–66, Cl. 82—36.

Majeske, John. Corn tenderizer. 3,270,789, 9–6–66, Cl. 146—203.

Makus, Zdzislaw: *See*—
Baltes, Josef, Weghorst, and Makus. 3,271,431.

Richardson, Cecil R., Manson, and Baker. 3,270,814.

Mantell, Gerald J., D. Rankin, and F. R. Galiano, to Gulf Oil Corp. Polymerizable 2-alkylene-m-dioxanyl acrylic esters. 3,271,377, 9–6–66, Cl. 260—88.3.

Mantle, Peter J., to Vehicle Research Corp. Amphibious automobile gem kit. 3,270,827, 9–6–66, Cl. 180—7.

Mapson, Donald L. Method for mending holes in fabrics. 3,271,217, 9–6–66, Cl. 156—98.

Marathon Oil Co.: *See*—
Allred, Victor D. 3,271,268.

Marbach, Jacob P. Calibrating system for proportioning syringe. 3,270,548, 9–6–66, Cl. 73—1.

Marconi's Co. Ltd., The: *See*—
Sosin, Boleslaw M. 3,271,683.

Marinace, John C., to International Business Machines Corp. Uniaxial crystal signal device. 3,271,631, 9–6–66, Cl. 317—234.

Marini, John W., to Litton Systems, Inc. Regenerative optical pumping system. 3,271,695, 9–6–66, Cl. 331—94.5.

Mark-Fast Marking System, Inc.: *See*—
Breverman, David. 3,270,666.

Marks, George M., to Industrial Heat Engineering Corp. Machine for heat setting synthetic fabrics. 3,271,016, 9–6–66, Cl. 263—3.

Maroney, Peter. Self-supercharging rotary engine. 3,270,723, 9–6–66, Cl. 123—43.

Marsden, Charles F., Jr.: *See*—
Vanderbilt, Byron M., and Marsden. 3,271,355.

Marsh-Armfield: *See*—
Marsh, John A., and Armfield. 3,270,394.

Marsh, John A., and G. W. Armfield, to Marsh-Armfield. Method of manufacturing cushions. 3,270,394, 9–6–66, Cl. 29—91.1.

Martens, Gunter, to Kiensle Apparate G.m.b.H. Adding system for binary coded excess three numbers. 3,271,566, 9–6–66, Cl. 235—174.

Martin, David G., to The Upjohn Co. Carbamoyl derivatives of lincomycin and processes for producing them. 3,271,885, 9–6–66, Cl. 260—210.

Martin, Horst-Edgar, and K. Spinler, to Siemens & Halske Aktiengesellschaft. Coaxial high-frequency cable with internal spacers. 3,271,506, 9–6–66, Cl. 174—28.

Martin, James. Ejection seats. 3,270,991, 9–6–66, Cl. 244—122.

Martin, James C., to Eastman Kodak Co. 1,2-thiazetidine-3-one-1-oxides and their preparation. 3,271,417, 9–6–66, Cl. 260—327.

Martin-Marietta Corp.: *See*—
Fiedler, Wallace A., Ross, and Estock. 3,271,561.

Martin, Ronald G.: *See*—
Guenther, Robert F., Jr., and Martin. 3,271,877.

Martin, William R. Fluid meter calibrating device. 3,270,-549, 9–6–66, Cl. 73—3.

Martinek, Thomas W.: *See*—
Haines, Robert M., Klass, and Martinek. 3,270,672.

Marsan, Peter R., to Litton Systems, Inc. Facsimile recording system having automatic contrast range control. 3,271,-513, 9–6–66, Cl. 178—6.6.

Marsan, Peter R., and J. R. Shonnard, to Litton Systems, Inc. Balanced modulator having the anode of a multiplier phototube directly connected to the cathode of the modulator tube. 3,271,699, 9–6–66, Cl. 332—3.

Mason, Paul B., L. Rubinstein, and A. J. Sable, to Polaroid Corp. Photographic apparatus support. 3,270,652, 9–6–66, Cl. 95—86.

Massa, Anthony, ½ to Leo A. Feula. Burr dispenser. 3,270,-416, 9–6–66, Cl. 32—22.

Massey-Ferguson Inc.: *See*—
Elliott, Brantford G., and Saunders. 3,270,894.

Massey, John: *See*—
Horning, Kenneth R., and Massey. 3,271,674.

Mathias, Joseph S.: *See*—

Richardson, Robert E.: *See*—
Spence, Sydney P., Steiner, Madestau, Kaufman, and Richardson. 3,271,470.

Richter, Philip, L. B. Smith, and F. J. Luipersbeck, to Fuller Co. Automatic hold back device. 3,270,801, 9-6-66, Cl. 160—213.

Rickey, Edward A.: *See*—
Daubenspeck, Benjamin K., and Rickey. 3,270,671.

Rickley, Samuel S., to Morgan Construction Co. Pressurized lubricating system. 3 270.836, 9-6-66, Cl. 184—6.

Riddle, Richard L., to Western Electric Co., Inc. System for maintaining an object in a predetermined reference plane. 3,271,650, 9-6-66, Cl. 318—489.

Riebe, John M.: *See*—
Crabill, Norman L., and Riebe. 3,270,505.

Riedl, Hans-Joachim, H. Frank, and W. Sauermilch, to Wasag-Chemie Aktiengesellschaft. Explosive with trinitrobenzene. 3,271,212, 9-6-66, Cl. 149—92.

Rigot, Roger: *See*—
Plurien, Pierre, Quenault, and Rigot. 3,270,414.

Riley, Peter L.: *See*—
Hutchinson, William G., Cole, and Riley. 3,271,262.
Frame, Alexander G., Parker, Stacey, and Riley. 3,271,263.

Rindner, Wilhelm, and R. F. Nelson, to Raytheon Co. Stress sensitive tunnel diode transducer. 3,270,555, 9–6–66, Cl. 73—88.5.

Rink, Helmut: *See*—
Hackenberg, Ulrich, Kamps, and Rink. 3,270,434.

Riopelle, Arthur J.: *See*—
Fletcher, John L., and Riopelle. 3,271,520.

Robble, Walter J., to Eaton Paper Corp. Photo display device. 3,270,449, 9–6–66, Cl. 40—102.

Robbins & Myers, Inc.: *See*—
Weed, Herman R. 3,271,648.

Roberts, Gilbert C., Jr., and G. G. Via, to International Business Machines Corp. Evaporant source. 3,271,562, 9–6–66, Cl. 219—275.

Robertshaw Controls Co.: *See*—
Morgan, David L., Snider, and Mingrone. 3,270,771.

Robinson, Gene H., to Eastman Kodak Co. Process for producing an electrostatic charge image. 3,271,145, 9–6–66, Cl. 96—1.

Robinson, Gene H., to Eastman Kodak Co. Xeroprinting with photoconductors exhibiting charge-storage asymmetry. 3,271,146, 9–6–66, Cl. 96—1.4.

Robinson Technical Products, Inc.: *See*—
Keetch, William A. 3,270,998.

Rocholl, Hans G., to Kwik Lok Corp. Method of and mechanism for closing bags. 3,270,481, 9–6–66, Cl. 53—14.

Rockey, Kenneth O.: *See*—
Boyd, David M., Jr., and Rockey. 3,271,111.

Rockwell-Standard Corp.: *See*—
Perren, Archie L., Mokersky, and Shepard. 3,270,981.
Tabor, Paul C. 3,271,071.

Roderburg, Gerd, and G. Steenken, to Deutsche Gold- und Silber-Scheideanstalt vormals Roessler. Granules of finely divided rubber reinforcing siliceous pigment and rubbery material. 3,271,356. 9–6–66, Cl. 260—41.5.

Roeggen, Karl A. Bollards. 3,270,705, 9–6–66, Cl. 114—218.

Rogge, Virgil D.: *See*—
Fischer, William, and Rogge. 3,270,426.

Rohe, Frederick W., and C. S. Phelan; said Phelan assor. to said Rohe. Method of installation of moldable insert in sandwich panel. 3,271,498, 9–6–66, Cl. 264—261.

Rohm, Fritz, W. Ahrens, and H. Strahle, to Dr. Walter U. Schmitt G.m.b.H. Metering and mixing device for dental materials. 3,271,011, 9–6–66, Cl. 259—12.

Rohm & Haas Co.: *See*—
Wilson, Harold F., and Skiles. 3,271,244.

Rohweder, Glen W., to Deere & Co. Mounting and dismounting means for agricultural machines. 3,270,489, 9–6–66, Cl. 56—21.

Rollman, Paul P. Retractable foldable rigid roof for vehicle body. 3,271,067, 9–6–66, Cl. 296—116.

Rolfs, John C.: *See*—
Deveau, Emile J., Rolfs, and Rossero. 3,271,772.

Rolscreen Co.: *See*—
Dunsmoor, Forrest L., and Kuyper. 3,271,902.

Rom, Frank E., to United States of America, National Aeronautics and Space Administration. Gaseous vortex reactor for a rocket motor. 3,270,496, 9–6–66, Cl. 60—35.5.

Roman Industries: *See*—
Pinto, Ross E. 3,270 842.

Rome, Martin, and H. O. W. Jordan, to The Machlett Laboratories, Inc. X-ray vidicon target assembly. 3,271,608, 9–6–66, Cl. 313—65.

Roming, Charles, Jr.: *See*—
Ellis, William J., and Roming. 3,271,458.

Rooney, John P., to General Electric Co. Microwave filter. 3,271,706, 9–6–66, Cl. 333—73.

Rooney, George F., Jr Machine for distributing particulate material. 3,270,923, 9–6–66, Cl. 222—193.

Ro-Search, Inc.: *See*—
Milner, George M. 3,270,358.

Rosemount Engineering Co.: *See*—
Lode, Tenny. 3,271,669.

Rosenburgh, Norman J., and D. D. McNair, to Eastman Kodak Co. Sheet conveyor. 3,271,025, 9–6–66, Cl. 271—45.

Rosenfeld, Melvin A., and R. G. Moyer, to Union Oil Co. of California. Digital measuring apparatus. 3,271,564, 9–6–66, Cl. 235—151.32.

Ross, Gilbert H.: *See*—
Fiedler, Wallace A., Ross, and Estock. 3,271,561.

Ross Operating Valve Co.: *See*—
Huntington, Andrew B., Abbott, and Brinkel. 3,270,625.

Ross, Roger J., to The Singer Co. Screwless-type presser-foot clamp. 3,270,695, 9–6–66, Cl. 112—240.

Rossero, Humbert P.: *See*—
Deveau, Emile J., Rolfs, and Rossero. 3,271,772.

Roudier, Rene: *See*—
Thome, Paul; Recule, and Roudier. 3,271,611.

Rouet, Jean: *See*—
Zvlak, Charles, and Rouet. 3,271,258.

Roussel-Uclaf, S.A.: *See*—
Bertin, Daniel, and Perronnet. 3,271,391.

Rovoldt, Charles L.: *See*—
Schott, Arthur K., Bartha, and Rovoldt. 3,270,605.

Rowe, Jack D.: *See*—
Spell, Daniel M., Jr., and Rowe. 3,271,613.

Roy, Joseph R.: *See*—
Berman, Nelson, Seiden, and Roy. 3,270,569.
Berman, Nelson, Seiden, and Roy. 3,271,715.

Rozanski, Frank G., to Aqua-Dart, Inc. Aquatic device. 3,270,707, 9–6–66, Cl. 115—70.

Rozier, Julian B.: *See*—
Cook, George L., Sr., and Bloom. 3,270,368.

Rubinstein, Leon: *See*—
Mason, Paul B., Rubinstein, and Sable. 3,270,652.

Rubricius, Jeanette L. Small animal cage. 3,270,713, 9–6–66, Cl. 119—17.

Rudberg, Harry I. A. Automatic car parking-meter for garages. 3,270,847, 9–6–66, Cl. 194—1.

Rudnicki, William E., and J. M. Benson, to The Ford Motor Co. Axle housing assembly. 3,270,583, 9–6–66, Cl. 74—607.

Ruff, Richard J., deceased, by National Bank of Detroit, executor, to Universal Oil Products Co. Catalytic radiant heat treating apparatus. 3,270,798, 9–6–66, Cl. 158—99.

Rumberger, George G., to KVP Sutherland Paper Co. Wax compositions and coated articles. 3,271,177, 9–6–66, Cl. 106—272.

Rumble, Dale H., and H. R. Ulander, to International Business Machines Corp. Demodulation system. 3,271,742, 9–6–66, Cl. 340—167.

Rummel, Theodor, to Siemens & Halske Aktiengesellschaft. Method of eliminating semiconductor material precipitated upon a heater in epitaxial production of semiconductor members. 3,271,209, 9–6–66, Cl. 148—175.

Runge, Wallace F., to Commercial Solvents Corp. Process for the separation and recovery of hydroxylammonium salt. 3,271,105, 9–6–66, Cl. 23—87.

Rush, Sarah J.: *See*—
Akin, George A., Rush, and Russin. 3,271,370.

Russell, Charles K.: *See*—
Powers, William H., and Russell. 3,271,172.

Russell, Harold D., and C. F. Amering, to Eastman Kodak Co. Roller transfer processing mechanism. 3,270,654, 9–6–66, Cl. 95—89.

Russin, Nicholas C.: *See*—
Akin, George A., Rush, and Russin. 3,271,370.

Rutt, Richard D., and A. C. Carlson, to The Carborundum Co. Grinding apparatus. 3,271,909, 9–6–66, Cl. 51—165.

Ryhiner Guenther: *See*—
Beste, Hermann, Koenig, Voss, and Ryhiner. 3,271,199.

SCM Corp.: *See*—
Goldsmith, Arthur C., and Psone. 3,270,851.

Saab Aktiebolaget: *See*—
Bjernekull, Bo A. G. 3,271,224.

Sable, Arthur J.: *See*—
Mason, Paul B., Rubinstein, and Sable. 3,270,652.

Sackett, Walter J., Sr. Bulk blending plant. 3,270,896, 9–6–66, Cl. 214—2.

Sackett, Willard A., to Spreckels Sugar Co. Apparatus for separating finely divided solid materials from liquids. 3,270,886, 9–6–66, Cl. 210—189.

Sacks, Kenneth L., to General Electric Co. Coffee maker lid retaining means. 3,270,911, 9–6–66, Cl. 220—55.

Sadler, Thomas H., and G. P. Reimschussel, to Johns-Manville Corp. Methods for making asbestos fiber products. 3,271,186, 9–6–66, Cl. 117—100.

Salatin, David C.: *See*—
Hall, Harry D., Salatin, Sutherland, and Teible. 3,270,383.

Salowe, Seymour, and W. J. Schmidt, to Westinghouse Electric Corp. Apparatus for generating a plurality of phase displaced periodic electrical quantities. 3,271,655, 9–6–66, Cl. 321—7.

Salter, Larry, and F. S. Briles, to Briles Mfg. Co-Partnership. Method of prestressed fastening of materials. 3,270,410, 9–6–66, Cl. 29—446.

Samson, Alexander: *See*—
Chaikin, Malcolm, and Samson. 3,270,532.

Sand, Darrel R., and A. M. Connell, to General Motors Corp. Pump assembly. 3,270,679, 9–6–66, Cl. 103—126.

Sanders Associates, Inc.: *See*—
Racy, Joseph E. 3,271,701.
Tabor, Robert W. 3,271,214.

Sandoz, Inc.: *See*—
Griot, Rudolf G. 3,271,404.

Sandoz Ltd.: *See*—
Bitterli, Peter. 3,271,397.

Sanitary Scale Co.: *See*—
Karp, Edward C. 3,270,890.

Sanowskis Albert C. Push-button operated combination locks. 3,270,537, 9–6–66, Cl. 70—313.

Santelli, Thomas R., to Owens-Illinois Glass Co. Method of producing composite packages. 3,271,500, 9–6–66, Cl. 264—269.

Sarett, Lewis H.: *See*—
Shen, Tsung Y., and Sarett. 3,271,416.

Sather, Eugene, and L. H. Stocker, to Bell & Howell Co. Inserter with document responsive track control means. 3,271,022, 9–6–66, Cl. 270—58.

Sauermilch, Walter: *See*—
Riedl, Hans-Joachim, Frank, and Sauermilch. 3,271,212.

Saunders, Eldon J. Hitch bar protector. 3,271,050, 9–6–66, Cl. 280—507.

Saunders, Harry C., to Universal Oil Products Co. Synthetic lavandin oil. 3,271,259, 9–6–66, Cl. 167—94.

Saunders, Max R.: *See*—
Elliott, Brantford G., and Saunders. 3,270,894.

Saur, Eugen J. Process of making niobium stannide bodies. 3,270,400, 9–6–66, Cl. 29—155.5.

Sawdey, George W. to Eastman Kodak Co. Photographic element. 3,271,156, 9–6–66, Cl. 96—84.

Sawyers Research Development Corp.: *See*—
Hall, Walter J. 3,270,445.

Sayers, John B.: *See*—
Murray, Peter, and Sayers. 3,271,265.

Scardiglia, Frank: *See*—
Goldberg, Eugene P., and Scardiglia. 3,271,368.

Scauzillo, Frank R.: *See*—
Connally, Carl, Jr., and Scauzillo. 3,270,809.

Schauer, Ralph F., to International Business Machines Corp. Register search and detection system. 3,271,745, 9–6–66, Cl. 340—172.5.

Scheer, Irving, and R. A. Mallory, to Ortho Pharmaceutical Corp. 16α-methyl progesterones. 3,271,424, 9–6–66, Cl. 260—397.3.

Schelin, Ross P. Release device for door latch. 3,271,062, 9–6–66, Cl. 292—336.3.

Schering A.G.: *See*—
Kero, Ulrich, Kieslich, and Wiechert. 3,271,252.

Schering Corp.: *See*—
Villani, Frank J. 3,271,426.
Villani, Frank J. 3,271,428.

Schiedru, Hans-Otto, and K. Worret, to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning. Axial extruder head with mandrel for extruding hollow profiles. 3,270,371, 9–6–66, Cl. 18—14.

Schill, Karl T.: *See*—
Stenestam, Arne W., and Schill. 3,270,444.

Schink, William N., to Indak Mfg. Corp. Electrical switch with contact grounding strap. 3,271,536, 9–6–66, Cl. 200—16.

Schlabach, Leland A., to Westinghouse Electric Corp. Apparatus for regulating the phase and magnitude of the output voltage of a polyphase inverter. 3,271,654, 9–6–66, Cl. 321—5.

Schlumberger Well Surveying Corp.: *See*—
Cubberly, Walter E., Jr. 3,271,733.

Schmalz, Konrad. Article testing devices. 3,270,551, 9–6–66, Cl. 73—38.

Schmid, John H., to Zurn Industries, Inc. Fitting for batteries of wall mounted wall closets. 3,271,054, 9–6–66, Cl. 285—93.

Schmidt, Alfred, to Form-Gesellschaft fur Formgebung m.b.H. Portable container of synthetic material adapted to be stacked. 3,270,922, 9–6–66, Cl. 222—143.

Schmidt, Richard, to United States of America, National Aeronautics and Space Administration. Reactance control system. 3,270,985, 9–6–66, Cl. 244—1.

Schmidt, Warren J.: *See*—
Salowe, Seymour, and Schmidt. 3,271,655.

Schmidt-Nickels, Wilhelm: *See*—
Katz, Leon, and Schmidt-Nickels. 3,271,422.
Katz, Leon, and Schmidt-Nickels. 3,271,423.
Randall, David L., and Schmidt-Nickels. 3,271,435.

Schmitz, Henry: *See*—
Price, Kenneth E., and Schmitz. 3,271,253.

Schneider, Edwin F.: *See*—
Di Guilio, Guy, Mathias, and Schneider. 3,271,274.

Schneider, William H. Lathe drill attachment. 3,270,590, 9–6–66, Cl. 77—6.

Schnell, Hermann, H. Krimm, and L. Bottenbruch, to Farbenfabriken Bayer Aktiengesellschaft. Thermoplastic polycarbonates of dihydroxydiarylene suifones, and their preparation. 3,271,367, 9–6–66, Cl. 260—49.

Schnick, Raymond G.: *See*—
Brown, Richard G., and Schnick. 3,271,736.

Schnider, Otto: *See*—
Fabrni, Peter, Mosimann, and Schnider. 3,271,402.
Grussner, Andre, and Schnider. 3,271,403.

Schoenberger, Philip J. Match book. 3,270,866, 9–6–66, Cl. 206—29.

Schonbach, Viktor: *See*—
Weissert, Josef, Schonbach, and Memmel. 3,271,354.

Schonfeld, Arnold, and J. C. Schulte, to Sperry Rand Corp. Pressure responsive switch with liquid contact means. 3,271,543, 9–6–66, Cl. 200—81.6.

Schonfeld, Arnold, to Sperry Rand Corp. Pneumatic tubing memory. 3,270,961, 9–6–66, Cl. 235—201.

Schoonmaker, Andrew M.: *See*—
Schoonmaker, George P. and A. M. 3,271,049.

Schoonmaker, George P. and A. M. Vehicle tow bar. 3,271,049, 9–6–66, Cl. 280—493.

Schott, Arthur K., K. J. Bartha, and C. L. Rovoldt, to Houdaille Industries, Inc. Punching machine with detachable tool holder. 3,270,605, 9–6–66, Cl. 83—522.

Schott, Charles M., Jr., to The First National Bank of Boston. Die. 3,271,560, 9–6–66, Cl. 219—243.

Schott, Charles M., Jr., to Gloucester Engineering Co., Inc. Cutting blade assembly. 3,270,606, 9–6–66, Cl. 83—579.

Schrack, Frank C.: *See*—
Bassett, Leon H., Fouser, Kaman, and Schrack. 3,270,821.

Schrader, Gerhard, to Farbenfabriken Bayer Aktiengesellschaft. Bis-N,N-dialkylamino phosphoric acid esters of O,O - dialkyl - α - hydroxy-β,β,β-trichloroethylphosphonates. 3,271,480, 9–6–66, Cl. 260—931.

Schrader, Joseph J., Jr.: *See*—
Reied, Walter A., and Schrader. 3,270,931.

Schreiner, Max P., to Texas Instruments Inc. Four-terminal semiconductor switch circuit. 3,271,587, 9–6–66, Cl. 307—88.5.

Schrems, Joseph E.: *See*—
Ahlberg, Richard E., and Schrems. 3,271,170.

Schrenk, Gotthilf: *See*—
Peter, Helmut, and Schrenk. 3,271,677.

Veneman, Dirk J., and H. F. Budsien, to Beloit Corp. Calender stack. 3,270,664, 9–6–66, Cl. 100—162.
Via, Giorgio G.: *See*—
Roberts, Gilbert C., Jr., and Via. 3,271,562.
Vidhani, Kishan V.: *See*—
Fitton, Sydney, and Vidhani. 3,270,492.
Villani, Frank J., to Schering Corp. Novel androstan oximino ethers and methods for their manufacture. 3,271,426, 9–6–66, Cl. 260—397.5.
Villani, Frank J., to Schering Corp. Novel estratriene oximino ethers and methods for their manufacture. 3,271,428, 9–6–66, Cl. 260—397.5.
Visner, Sidney, to Combustion Engineering, Inc. Organic moderated nuclear reactor and control method therefor. 3,271,261, 9–6–66, Cl. 176—20.
Vitamins Ltd.: *See*—
Watt, Peter R. 3,271,271.
Watt, Peter R. 3,271,272.
Venturino, Anthony J.: *See*—
Katz, Kurt, Federmann, and Venturino. 3,270,744.
Vogel, Henry A., and H. G. Bittle, to Pittsburgh Plate Glass Co. Resinous compositions of carboxylic amide interpolymer and unsaturated ester polymers. 3,271,479, 9–6–66, Cl. 260—901.
Vogl, Norbert G., Jr., and J. A. Parisi, to International Business Machines Corp. Magnetic storage and switching system. 3,271,749, 9–6–66, Cl. 340—174.

Von, Sanden, H. Suckfüll, and A. Darre, to Siemens & Halske Aktiengesellschaft. Circuit arrangement for ascertaining operating conditions of subscriber stations of a time multiplex communication system. 3,271,521, 9–6–66, Cl. 179—15.

Vopel, Karl-Heins: *See*—
Kronig, Walter, Muller, and Vopel. 3,271,297.

Vordahl, Milton B., to Crucible Steel Co. of America. Method of producing dispersoid strengthened material. 3,270,412, 9–6–66, Cl. 29—472.3.

Vortex Tool & Mfg. Co.: *See*—
Bowden, J. E., and Lynch. 3,271,929.

Voss, Ernst: *See*—
Beste, Hermann, Koenig, Ryhiner, and Voss. 3,271,199.

Votava, Werner: *See*—
Burgyan, Aladar, and Votava. 3,271,171.

Wacker, Hermann and Wacker, P.: *See*—
Kestel, Heinrich. 3,270,635.

Wade, William L., Jr., to United States of America, Army. Method of making manganese ferrite film from nitrate solution. 3,271,191, 9–6–66, Cl. 117—169.

Wagner, Robert W., to Dana Corp. Gear shift locking device. 3,270,580, 9–6–66, Cl. 74—475.

Wainer, Eugene: *See*—
Lockhart, Robert J., and Wainer. 3,271,173.

Wakasa, Ryoichi, A. Shibata, J. Ohmura, and I. Suzuki, to Asahi Kasei Kogyo Kabushiki Kaisha. Process for producing elastic polyurethane yarn. 3,271,346, 9–6–66, Cl. 260—30.8.

Wakelyn, Noel T.: *See*—
Jewell, Robert A., and Wakelyn. 3,271,181.

Walder, Henry: *See*—
Borges, John A. 3,270,634.

Waldorf Paper Products Co.: *See*—
Giesler, Jerry B. 3,270,878.
Hennessey, Russell J., and Gulliver. 3,270,867.
Rasmussen, Walter H. 3,270,947.
Redpath, John R., and Wysocki. 3,270,946.

Wales, Nathaniel B., Jr. Multiposition manual latching switch for indicating last entry. 3,271,757, 9–6–66, Cl. 340—332.

Walker, Douglas H.: *See*—
Maloney, Clifford J., and Walker. 3,271,563.

Walker, Harry L., to Phillips Petroleum Co. Control system for fractional distillation. 3,271,269, 9–6–66, Cl. 202—160.

Wallace, Adele B.: *See*—
Wallace, Hampton K., and A. B. 3,270,694.

Wallace, Archie C. Time controlled locating alarm system. 3,270,493, 9–6–66, Cl. 58—152.

Wallace, Hampton K., and A. B. Combination ash and beverage tray for card tables. 3,270,694, 9–6–66, Cl. 108—26.

Wallach, Mark K., to Wolverine Shoe & Tanning Corp. Lace puller. 3,270,927, 9–6–66, Cl. 223—113.

Walsey, Harvey: *See*—
Wight, Robert O., and Walsey. 3,271,557.

Walsh, Donald T., Gullich Ltd. Mine roof and like supports. 3,270,510, 9–6–66, Cl. 61—45.

Walter, John L., to General Electric Co. Method for producing oriented silicon-iron. 3,271,203, 9–6–66, Cl. 148—113.

Walter, John L.: *See*—
Freeman, Eleanor A., and Walter. 3,271,202.

Waltonen, Edward J., to Wes Industries, Inc. Force applying fabricating devices. 3,270,604, 9–6–66, Cl. 83—140.

Wals, Alfred, and R. Ostreicher, to Messrs. Farako Kondensatoren-und Apparatebau Gesellschaft mit beschrankter Haftung. Supervisory battery charger responsive to the number of charge-discharge cycles. 3,271,652, 9–6–66, Cl. 320—44.

Ward, Donald R., to United States of America, National Aeronautics and Space Administration. Automatically deploying nozzle exit cone extension. 3,270,504, 9–6–66, Cl. 60—35.6.

Ward, Donald W.: *See*—
Reddish, Alan, and Ward. 3,271,609.

Ward, Lawrence T.: *See*—
Gevirman, Jerome, and Ward. 3,270,528.

Warner, Philip D.: *See*—
Hirshon, Jack M., and Warner. 3,271,555.

Warner, Wilton C.: *See*—
Reed, Reginald A., and Warner. 3,270,861.

Warson, Henry, and D. S. W. Dargan, to Dunlop Rubber Co. Ltd. Vinyl ester copolymers. 3,271,336, 9–6–66, Cl. 260—17.4.

Wasag-Chemie Aktiengesellschaft: *See*—
Riedl, Hans-Joachim, Frank, and Sauermilch. 3,271,212.

Washburn, Frederick L., Jr., to Westinghouse Electric Corp. Traveling wave electron discharge device having means exerting a radial force upon the envelope. 3,271,615, 9–6–66, Cl. 315—3.5.

Waters, James D., to Otis Engineering Corp. Gas lift valves. 3,270,765, 9–6–66, Cl. 137—155.

Waters, James L., to General Electric Co. Centrifugal switching mechanism for dynamoelectric machines. 3,271,602, 9–6–66, Cl. 310—68.

Waters, Robert S., to Westinghouse Electric Corp. Coupling. 3,271,052, 9–6–66, Cl. 285—7.

Waters, Robert S., and J. W. Gilliom, to Westinghouse Electric Corp. Suction cleaner bumper. 3,270,365, 9–6–66, Cl. 15—325.

Watney Combe Reid & Co. Ltd.: *See*—
Bishop, Laurence R. 3,271,162.

Watson, Harold J.: *See*—
Allen, Thomas C., and Watson. 3,271,305.

Watson, Richard W.: *See*—
Velt, Theodore L., and Watson. 3,271,308.

Watson, Robert A.: *See*—
Gentich, Eugene, Lundberg, and Watson. 3,270,566.

Watson, Robert D., to Atomic Energy of Canada Ltd. Process for producing a diffusionless bond between metals. 3,270,413, 9–6–66, Cl. 29—527.

Watt, Peter R., to Vitamins Ltd. Molecular still having stationary evaporator and condenser surfaces. 3,271,271, 9–6–66, Cl. 202—173.

Watt, Peter R., to Vitamins Ltd. Vibratory wiping distillation apparatus. 3,271,272, 9–6–66, Cl. 202—236.

Watts, Robert, to Imperial Chemical Industries Ltd. Applicator. 3,270,962, 9–6–66, Cl. 239—165.

Way, Stewart, to Westinghouse Electric Corp. Magnetohydrodynamic generating duct. 3,271,597, 9–6–66, Cl. 310—11.

Webb, James E., administrator of the National Aeronautics and Space Administration, with respect to an invention of T. E. Cowell, and I. B. Madison. Aerodynamic spike nozzle. 3,270,501, 9–6–66, Cl. 60—35.6.

Webb, James E., administrator of the National Aeronautics and Space Administration with respect to an invention of F. Vickers, E. Romvary, Jr. Intermittent-type silica gel adsorption refrigerator. 3,270,512, 9–6–66, Cl. 62—2.

Webb, James E., administrator of the National Aeronautics and Space Administration with respect to an invention of E. F. Pasierb. Gas solar detector using manganese as a doping agent. 3,271,637. 9–6–66, Cl. 317—234.

Webb, James E., administrator of the National Aeronautics and Space Administration with respect to an invention of R. D. Benedict. Transient augmentation circuit for pulse amplifiers. 3,271,594. 9–6–66, Cl. 307—88.5.

Webb, James E.; administrator of the National Aeronautics and Space Administration with respect to an invention of H. Kastan. Absorptive splitter for closely spaced supersonic engine air inlets. 3,270,990. 9–6–66, Cl. 244—53.

Webb, James E.; administrator of the National Aeronautics and Space Administration with respect to an invention of J. E. Guisinger. Starting circuit for vapor lamps and the like. 3,271,620. 9–6–66, Cl. 315—160.

Weber, Bernhard W. A., to Air Reduction Co. Inc. Method of arc welding. 3 271,559, 9–6–66, Cl. 219—137.

Weber, Ralph O., and F. E. Horan, to Archer-Daniels-Midland Co. Biochemical synthesis of industrial gums. 3,271,267. 9–6–66, Cl. 195—31.

Webster, Edward, to Edward Webster Ltd. Machine for assembling lipstick components. 3,270,405, 9–6–66, Cl. 29—208.

Webster, Edward Ltd.: *See*—
Webster, Edward. 3,270,405.

Weed, Herman R., to Robbins & Myers, Inc. Universal-motor counter speed control circuit. 3,271,648, 9–6–66, Cl. 318—331.

Weesner, William E., to Monsanto Co. Catalytic polymerization of olefins to liquid polymers. 3,271,475, 9–6–66, Cl. 260—683.15.

Weghorst, Friedrich: *See*—
Baltes, Josef, Weghorst, and Makus. 3,271,432.

Wegner, Herman E. to Alcan Aluminum Corp. Machine for shaving embossed letters on bottle closures. 3,270,620, 9–6–66 Cl. 90—15.

Weinar, Roger N. Suspension grid system for a ceiling construction. 3,270,479. 9–6–66, Cl. 52—667.

Weinberg, Marvin A., to Johnson & Johnson. Polyurethane coating from mixed polyurethane polymers. 3,271,352, 9–6–66, Cl. 260—37.

Weinert, Glen A.: *See*—
Tiehler, Earl J., and Weinert. 3,270,425.

Weissert, Josef, V. Schonbach, and F. Memmel, to Farkwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning. Pigment preparations for the coloration of plastic masses. 3,271,354. 9–6–66, Cl. 260—41.

Welch, Archibald H., to Converters Inc. Envelope attaching machines. 3,270 629, 9–6–66, Cl. 93—61.

Welcher, Richard P., to American Cyanamid Co. Phosphorinanone oximes. 3,271,449, 9–6–66, Cl. 260—566.

Wendle, Edward F., to Owens-Illinois Inc. Parison forming apparatus 3 271,127. 9–6–66. Cl. 65—207.

Wentorf, Robert H., Jr., to General Electric Co. High pressure method and apparatus. 3,271,502, 9–6–66, Cl. 264—320.

Werner, Anton: *See*—
Baxter, Duane W., Felton, Winnard, and Werner. 3,271,589.

Wolff, Erika: *See*—
Stilz, Walter, Pommer, Fessmann, and Wolff. 3,271,321.

Wolff, Vernon C., Jr., to E. I. du Pont de Nemours and Co. Use of ionized salts of unsaturated monocarboxylic acids to prevent coagulation in emulsion polymerization of carboxyl containing monomers. 3,271,373, 9–6–66, Cl. 260—80.5.

Wolverine Shoe & Tanning Corp.: *See*—
Wallach, Mark K. 3,270,927.

Woodberry, Paul T., to United States of America, Air Force. Foamed plastic structure having a uniform continuous metal coating integrally bonded to the surface thereon. 3,271,119, 9–6–66, Cl. 29—191.

Wood, Ernest C., ½ to R. G. LeVaux, and ½ to P. B. Samuels. Hemostatic clip constructions. 3,270,745, 9–6–66, Cl. 128—325.

Wood, Keith E., to Deere & Co. Blower conveyor. 3,271,082, 9–6–66, Cl. 302—37.

Woofter, Robert C., and W. C. Luscombe, to General Motors Corp. Dashboard subassembly. 3,270,831, 9–6–66, Cl. 180—90.

Woolman, Granville: *See*—
Brown, Edwin C., and Woolman. 3,270,899.

Worcester, Gurdon S.: *See*—
Ives, Robert S. 3,271,228.

Workman, Samuel T.: *See*—
Haake, Claus H., Workman, and Johnson. 3,271,668.

Woroble, Joseph. High voltage television test probe having an adjustable frequency blinker indicator. 3,271,673, 9–6–66, Cl. 324—72.5.

Worret, Kurt: *See*—
Schiedru, Hans-Otto, and Worret. 3,270,371.

Worson, Lee, to Edoco Technical Products, Inc. Method and apparatus for forming joints in concrete. 3,270,636, 9–6–66, Cl. 94—51.

Worthington Corp.: *See*—
Bellmer, Friedrich O. 3,270,952.
Rayner, Raymond E., and Chubb. 3,270,521.
Wotring, Albert W.: *See*—
Ballman, Richard L., and Wotring. 3,270,553.
Wright, Charles E. Bag closure. 3,264,698, 8–9–66, Cl. 24—30.5.
Wright, James A.: *See*—
Chambers, Worthy L., and Wright. 3,271,013.
Wright, Robert H., and E. J. Moulton. Method of and apparatus for stringing extra heavy duty electric power conductors. 3,271,009, 9–6–66, Cl. 254—134.3.
Wu, Tao-Yuan, to Ford Motor Co. Altitude compensated charge forming device. 3,271,014, 9–6–66, Cl. 261—43.
Wuppermann, August T., to Hydraulik G.m.b.H. Drives for forge tongs. 3,270,546, 9–6–66, Cl. 72—419.
Wyandotte Chemicals Corp.: *See*—
Earing, Mason H. 3,271,462.
Otrhalek, Joseph V., and Luoma. 3,271,317.
Wysocki, Lawrence S.: *See*—
Redpath, John R., and Wysocki. 3,270,946.
Xerox Corp.: *See*—
Clark, Harold E. 3,270,637.
Yang, Richard F. H., to Andrew Corp. Vertically polarized log-periodic antenna. 3,271,775, 9–6–66, Cl. 343—792.5.
Yates, Donald N. Methods of making animation illustrators. 3,271,213, 9–6–66, Cl. 156—3.
Yamamoto, Kenichi, to Toyo Kogyo Co. Ltd. Sealing device for rotary piston engine. 3,270,954, 9–6–66, Cl. 230—145.
Yager, Victor: *See*—
Rabinowitz, Jacob G., and Yager. 3,271,032.
Yamaya, Wataru, and K. Matsui, to Mitsubishi Chemical Industries Ltd. Disazo dyes containing an N-substituted benzothiazolyl group. 3,271,383, 9–6–66, Cl. 260—158.
Yanmar Diesel Engine Co., Ltd.: *See*—
Hamada, Yoshitsugu. 3,270,719.
Yardney International Corp.: *See*—
Berchielli, Aldo S., and Di Pasquale. 3,271,195.
Yarger, Frank A.: *See*—
Kendall, William D., and Yarger. 3,270,746.
Yawata Iron & Steel Co., Ltd.: *See*—
Maehara, Shigeru, and Garashi. 3,271,129.
Ohtake, Tadashi, Muta, Zaizen, and Nishi. 3,271,138.
Yntema, Leonard F. Refractory metal production. 3,271,277, 9–6–66, Cl. 204—64.
Yochelson, Saul B., to Goodyear Aircraft Corp. Magnetic core logic circuits. 3,271,582, 9–6–66, Cl. 307—88.
Yokohama Seito Kabushiki Kaisha: *See*—
Oikawa, Hideo. 3,271,194.
Yon, James H., Jr., to Jett Mfg. Corp. Card stop motion. 3,270,374, 9–6–66, Cl. 19—.25.
Yoshida Kogyo K.K.: *See*—
Fukurol, Takeo. 3,270,535.
Young, David M.: *See*—
Cook, Denys, and Young. 3,271,455.
Young, David W., and G. A. Uhl, to Sinclair Research, Inc. Ethylene-styrene copolymer as pour point depressant. 3,271,121, 9–6–66, Cl. 44—62.
Young, James R., and R. L. Mills, to Planet Instrument, Inc. Indicator. 3,270,959, 9–6–66, Cl. 235—110.
Young, Lester C., to Spo Inc. Jolting mechanism for foundry apparatus. 3,270,375, 9–6–66, Cl. 22—45.
Z.R.C.-Zuccolo, Rochet & Co.: *See*—
Brunet, Louis. 3,270,928.
Zaizen, Takashi: *See*—
Ohtake, Tadashi, Muta, and Zaizen. 3,271,138.
Zane, John K.: *See*—
Kaiser, Donald W., and Zane. 3,271,411.
Zanner, Johann: *See*—
Neudecker, Karl, and Zanner. 3,271,098.
Zappia, Anthony T. Adjustable fluid timer. 3,271,002, 9–6–66, Cl. 251—239.
Zelger, Kenneth K., to General Atronics Corp. Electrical system. 3,271,762, 9–6–66, Cl. 343—7.
Zeitman, Samuel A.: *See*—
Pritchard, Colin, and Zeitman. 3,271,211.
Zellers, James T., Jr.: *See*—
George, John E., Zellers, and King. 3,270,466.
Zenith Radio Corp.: *See*—
Adler, Robert, Crumly, Foster, and Lindley. 3,271,731.
Ziegler, George W., Jr.: *See*—
Demler, Genry W., and Ziegler. 3,270,392.
Ziegler, Wallace F., and N. D. Whitehill, to Walter Kidde & Co., Inc. Flexible enclosed cable operating and disconnect mechanism. 3,270,387, 9–6–66, Cl. 24—230.
Zima, Herbert, to Lonza Ltd. Stabilized diketene and method for its production. 3,271,420, 9–6–66, Cl. 260—343.9.
Zimmer, Hans J., Verfahrenstechnik: *See*—
Akbar, Mohammed A., and Simonis. 3,271,421.
Zimmerle, Wilbur J., and J. E. Whelan, to General Motors Corp. Door operating mechanism. 3,270,572, 9–6–66, Cl. 74—89.22.
Zobel, Siegfried: *See*—
Engelsmann, Dieter, and Zobel. 3,270,645.
Zoellner, Fritz, to Krauss-Maffei A.G. Locomotive truck. 3,270,691, 9–6–66, Cl. 105—199.
Zuech, Ernest A.: *See*—
Reinert, Andrew J., Zuech, and Cantrel. 3,271,247.
Zurn Industries, Inc.: *See*—
Schmid, John H. 3,271,054.
Zviak, Charles, and J. Rouet, to Societe Anonyme dite: L'Oreal. Melamine and dicyandiamide as depilatory accelerators. 3,271,258, 9–6–66, Cl. 167—89.
Zweig, Hans J.: *See*—
Stultz, Keith F., and Zweig. 3,271,758.
Zwicker, Ulrich, to Metallgesellschaft Aktiengesellschaft. Process for the production of superconductive wires and bands. 3,271,200, 9–6–66, Cl. 148—11.5.

CLASSIFICATION OF PATENTS

ISSUED SEPTEMBER 6, 1966

NOTE.—First number, class; second number, subclass; third number, patent number

4– 41	3,270,351	33– 75	3,270,420	60– 52	3,270,508	75– 60	3,271,129	96– 66	3,271,154	117–132	3,271,188
192	3,270,352	137	3,270,421	54	3,270,509		3,271,130	75	3,271,155	138.8	3,271,189
5– 81	3,270,353	165	3,270,422	61– 45	3,270,510	63	3,271,131	84	3,271,156		3,271,190

GEOGRAPHICAL INDEX OF RESIDENCE OF INVENTORS

(U.S. States, Territories and Armed Forces, the Commonwealth of Puerto Rico, and the Canal Zone)

Alabama	1	Louisiana	17	Pennsylvania	37
Alaska	53	Maine	18	Puerto Rico	51
Arizona	2	Maryland	19	Rhode Island	38
Arkansas	3	Massachusetts	20	South Carolina	39
California	4	Michigan	21	South Dakota	40
Canal Zone	57	Minnesota	22	Tennessee	41
Colorado	5	Mississippi	23	Texas	42
Connecticut	6	Missouri	24	U.S. Army	55
Delaware	7	Montana	25	U.S. Air Force	54
District of Columbia	8	Nebraska	26	U.S. Navy	56
Florida	9	Nevada	27	U.S. Samoa	59
Georgia	10	New Hampshire	28	Utah	43
Guam	58	New Jersey	29	Vermont	44
Hawaii	50	New Mexico	30	Virgin Islands	52
Idaho	11	New York	31	Virginia	45
Illinois	12	North Carolina	32	Washington	46
Indiana	13	North Dakota	33	West Virginia	47
Iowa	14	Ohio	34	Wisconsin	48
Kansas	15	Oklahoma	35	Wyoming	49
Kentucky	16	Oregon	36		

(First number in listing denotes location according to above key. Refer to patent number in body of the Official Gazette to obtain details as to inventor name, location, etc.)

U.S. DEPARTMENT OF COMMERCE
OFFICIAL GAZETTE of the UNITED STATES PATENT OFFICE

September 6, 1966 Volume 830 Number 1

TRADEMARKS
NOTICES

United States Adopted Names

List No. 14

March 1, 1966 to June 30, 1966

The following nonproprietary names for the drugs described have been adopted by the USAN Council (the nomenclature committee sponsored by the American Medical Association, the American Pharmaceutical Association, and the United States Pharmacopeia) in cooperation with the interested manufacturers. The designation "United States Adopted Names" (U.S.A.N.) has been coined to distinguish these formally adopted nonproprietary names from other nonproprietary names. Adoption of such names does not imply endorsement of the products involved by the A.M.A. Council on Drugs, the USP, or the National Formulary.

Any comments or suggestions should be addressed to Doctor Joseph B. Jerome, Assistant Director, Council on Drugs, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

allobarbital: central nervous system depressant
betamethasone acetate: corticosteroid
betamethasone disodium phosphate: corticosteroid
cloperidone hydrochloride: sedative; tranquilizer
desclnolone acetonide: glucocorticoid
gamfexine: antidepressant
guanethidine monosulfate: hypotensive
hycanthone: schistosomacide
isosorbide: oral osmotic diuretic
lidoflazine: cardiovascular agent
mesterolone: oral androgenic hormone
metyrapone tartrate: diagnostic test of pituitary function
niclosamide: anthelmintic
nitarsone: veterinary histomonastat
nonoxynol: spermatocide
prednival: topical anti-inflammatory
prilocaine hydrochloride: local anesthetic
propiram fumarate: analgesic
pyrantel tartrate: anthelmintic
rifamide: antibacterial
roxarsone: veterinary growth stimulant
sodium ampicillin: antibiotic
sodium edetate: chelating agent
tetroquinone: treatment of keloids
trimoxamine hydrochloride: antihypertensive
trisodium edetate: chelating agent
viridofulvin: antifungal antibiotic

United States Adopted Names (USAN) and United States Adopted Names (Proposed) (USAN)

QUARTERLY CUMULATIVE LIST

January 1, 1966–June 30, 1966

This is a revised alphabetical listing of the nonproprietary names *proposed for adoption* by the USAN Council which were published in the Trademark Bureau Bulletin during the

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington, D.C., 20402 to whom all subscriptions should be made payable and all communications addressed; subscription price, $12.00 per annum, foreign mailing $4.00 additional; single copies, 25 cents each.

PRINTED COPIES OF TRADEMARK REGISTRATIONS are furnished by the Patent Office for 20 cents each. Address orders to the Commissioner of Patents, Washington, D.C., 20231.

period indicated. The listing also incorporates the revised lists of *adopted* nonproprietary names issued by the USAN Council, but not published in the Bulletin.

The Quarterly Cumulative List is intended to supplement USAN Cumulative List 4, 1961–1965, published annually for the Council by the United States Pharmacopeia; it is distributed with an issue of the Trademark Bureau Bulletin.

An asterisk (*) before a name indicates an *adopted name;* all other names on the list are *proposed for adoption.*

Since Q.C.L. is cumulative, only the latest issue need be consulted. All preceding lists may be discarded.

Any comments or protests regarding proposed names should be brought promptly to the attention of the USAN Council, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

*allobarbital: central nervous system depressant
asperlin: antibacterial; antineoplastic
*betamethasone acetate: corticosteroid
*betamethasone disodium phosphate: corticosteroid
*cloperidone hydrochloride: sedative; tranquilizer
*cyheptamide: anticonvulsant
*descinolone acetonide: glucocorticoid
*gamfexine: antidepressant
*guanethidine monosulfate: hypotensive
*hycanthone: schistosomacide
*ibufenac: analgesic; anti-inflammatory
*isosorbide: oral osmotic diuretic
*lidoflazine: cardiovascular agent
*mefruside: diuretic
*mesterolone: oral androgenic hormone
*metyrapone tartrate: diagnostic test of pituitary function
*niclosamide: anthelmintic
*nifuraldezone: antibacterial
*nitarsone: veterinary histomonastat
*nitrasepam: hypnotic; anticonvulsant
*nitromide: veterinary coccidiostat and antibacterial
*nonoxynol: spermatocide
*norgestrel: progestin
*pemoline: central nervous system stimulant
phenobarb: proposed abbreviation for phenobarbital
phthalofyne: veterinary anthelmintic
*prednival: topical anti-inflammatory
*prilocaine hydrochloride: local anesthetic
*propiram fumarate: analgesic
*pyrantel tartrate: anthelmintic
quilaxine maleate: oxytocic
*rifamide: antibacterial
*roxarsone: veterinary growth simulant
seperidol hydrochloride: neuroleptic
*sodium ampicillin: antibiotic
*sodium edetate: chelating agent
*sodium ethacrynate: diuretic
sulfabens: veterinary antibacterial and anticoccidial
sulfafen: antibacterial; anticoccidial agent
*tetramisole hydrochloride: anthelmintic
*tetroquinone: treatment of keloids
thyroglobulin: thyroid preparation
*trimoxamine hydrochloride: antihypertensive
*trisodium edetate: chelating agent
*viridofulvin: antifungal antibiotic
zolertine hydrochloride: vasodilator; anti-adrenergic; antihypertensive

Service by Publication

A petition to cancel each of the registrations identified below having been filed, and the notice of such proceedings sent by registered mail to each registrant at the last known address having been returned by the Post Office as undeliverable, notice is hereby given that unless the registrants listed herein, their assigns or legal representatives, shall enter an appearance within thirty days from the date of this publication, the cancelation will be proceeded with as in the case of default.

Gale Hall Engineering, Inc., assignee of Universal Chemists, Inc., sometimes doing business as Gale Hall Engineering, Exeter, N.H., Reg. No. 544,347, Canc. No. 8691.

Mariday Casuals, Inc., New York, N.Y., Reg. No. 746,671, Canc. No. 8705.

Rainbow Aluminum Products, Inc., North Miami Beach, Fla., Reg. No. 764,160, Canc. No. 8707.

Old File Cutlery Company, a corporation, assignee, by mesne assignments, of Old File Cutlery Company, a firm, Havana, Ill., Reg. No. 112,802, Canc. No. 8710.

Carshel, Inc., Pennsauken, N.J., Reg. No. 778,303, Canc. No. 8726.

EDWIN L. REYNOLDS,
First Assistant Commissioner of Patents.

Extensions of Time

It is ordinarily desirable that notice of the action taken by the Patent Office on requests for extension of time be communicated to the persons making the requests as soon as is reasonably possible. In order to improve Patent Office service to patent and trademark applicants in this regard, the following procedure is being instituted effective immediately. If a request for extension of time is filed in duplicate and accompanied by a stamped return-addressed envelope, the Office will indicate the action taken on the duplicate and return it promptly in the envelope. Utilization of this procedure is optional on the part of applicant.

EDWARD J. BRENNER,
Aug. 3, 1966. *Commissioner of Patents.*

Trademark Suits

Notices under 15 U.S.C. 1116; Trademark Act of July 5, 1946

Reg. No. 22,406(a) (COCA-COLA in script), The Coca-Cola Company, Nutrient or tonic beverages; **Reg. No. 47,189(a)**, same, Tonic beverages and syrups for the manufacture of such beverages; **Reg. No. 238,145(a)** (COCA-COLA), same, Beverages and syrups for the manufacture of such beverages; **Reg. No. 415,755** (COKE), same, Non-alcoholic maltless beverages and the syrups for making such beverages, **filed** June 20, 1966, D.C., W.D. Mo. (Springfield), Doc. 2270, *The Coca-Cola Co.* v. *Sherm Lollar Lanes.* **Same, filed** July 6, 1966, D.C., N. Mex. (Albuquerque), Doc. 6728, *The Coca-Cola Company* v. *Spur Ind., doing business as Spur Lanes, Spur Lanes and Supper Club.*

Reg. No. 22,406(b); **Reg. No. 47,189(b)**; **Reg. No. 238,145(b)**; **Reg. No. 238,146** (COCA-COLA in script), The Coca-Cola Company, Beverages and syrups for the manufacture of such beverages; **Reg. No. 415,755(b)**, **filed** July 14, 1966, D.C., N.D. Tex. (Dallas), Doc. 3–1574, *The Coca-Cola Company* v. *Wade's Rocket Skating Palace et al.* Final judgment—defendant enjoined Aug. 1, 1966. **Same, filed** July 14, 1966, D.C. Colo. (Denver), Doc. 66–C–363, *The Coca-Cola Company* v. *Grand Junction Bowling Lanes, Inc.* **Same, filed** July 27, 1966, D.C. Oreg. (Portland), Doc. 66–380, *The Coca-Cola Company* v. *Theodore B. Bingham et al.*

Reg. No. 47,189. (See Reg. No. 22,406.)

Reg. No. 238,145. (See Reg. No. 22,406.)

Reg. No. 238,146. (See Reg. No. 22,406(b).)

Reg. No. 298,697 (GENUINE DUNCAN YO-YO AND DESIGN), Donald F. Duncan, Bandalore toy spinning tops; **Reg. No. 300,504** (YO-YO), Donald F. Duncan, Inc., same; **Reg. No. 685,842** (BUTTERFLY), same, Tops of the bandalore return type, **filed** Sept. 12, 1961, D.C., N.D. Ill. (Chicago), Doc. 61c1532, *Donald F. Duncan, Inc.* v. *Royal Tops Mfg. Co., Inc. et al.* Trademark registrations held valid and infringed; defendants enjoined Jan. 17, 1964. **Appealed** Apr. 6, 1964. Judgment of District Court reversed and remanded May 13, 1965. Judgment for defendants—Trademark registrations, numbered 298,697 and 300,504, held invalid; Trademark Registration No. 685,842 has not been infringed by defendants; defendants' counterclaims dismissed June 30, 1966.

Reg. No. 300,504. (See Reg. No. 298,697.)

Reg. No. 774,624. (See Reg. No. 709,385.)

Reg. No. 803,921 (LEE) Lee Pen Corp., Ball point pens, refills and erasers therefor, and related accessories, **filed** June 20, 1966, D.C., E.D. Mich. (Detroit), Doc. 28555, *Lee Pen Corp., Inc.* v. *Ira Brawer et al.*

MARKS PUBLISHED FOR OPPOSITION

SECTION 1

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Application for the registration of these marks in more than one class has been filed as provided in section 30 of said act as amended by Public Law 772, 87th Congress, approved Oct. 9, 1962, 76 Stat. 769. Opposition under section 13 may be filed within thirty days of this publication. See Rules 2.101 to 2.105.

A separate fee of twenty-five dollars for each class opposed must accompany the opposition.

[NOTE: For publication of marks presented in applications for registration in one class, see section 2.]

SN 193,666. Halibrand Engineering, Inc., Torrance, Calif. Filed May 18, 1964.

Applicant disclaims the depiction of a wheel apart from the mark as shown.

Class 19—Vehicles

For High Performance Race Car Chassis, and Equipment—Namely, Bodies, Magnesium Wheels, Wheel Hubs and Nuts Therefor, Spot Brakes and Discs and Cylinder Units Therefor, Center Steering Gear Units, and Torsion Bars.

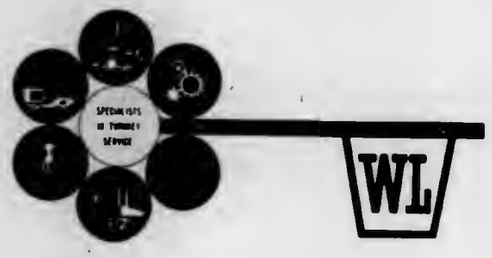
Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For High Performance Race Car Transmissions, and Equipment—Namely, Rear Ends, Rear End Center Sections, Ring and Pinion Gears, Quick-Change Rear Ends and Gears Therefor, Drive Hubs and Nuts Therefor, Torque Collars, and Axles.

First use 1952.

SN 202,514. Southern Saw Service, Inc., d.b.a. Atlanta Saw Company, Atlanta, Ga. Filed Oct. 23, 1964.

Class 15—Oils and Greases



For Silicon Releasing Agents, To Prevent Saws From Sticking.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

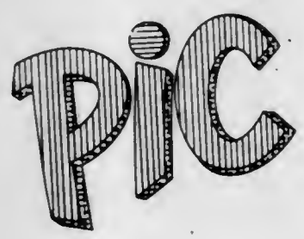
For Meat Saws, Cutlery Sharpeners, Smear Removers for Attachment to Band Saws, Spinal Cord Removers, and Replacement Parts Therefor.

First use on or about Sept. 1, 1964.

SN 206,902. The Wellman-Lord Engineering, Inc., Lakeland, Fla. Filed Nov. 24, 1964.

No claim is made to the exclusive right to use the words "Specialists in Turn Key Service" apart from the mark as shown, but applicant waives none of its common law rights therein. Owner of Reg. No. 731,293.

Class 100—Miscellaneous



For Advice and Consultation Services Offered to the Chemical Industry in Plant Evaluation, Design, and Layout.

Class 103—Construction and Repair

For Constructing Chemical Plants to the Specifications of Others.

First use Apr. 1, 1963.

SN 221,470. Cook Coffee Company, Maple Heights, Ohio. Filed June 18, 1965.

The drawing is lined for red, yellow, and blue, but no claim is made to color.

Class 6—Chemicals and Chemical Compositions

For Household Bleach.
First use on or prior to Mar. 1, 1965.

Class 52—Detergents and Soaps

For All-Purpose Household Liquid and Powder Detergents, Cleaners, Cleansers, and Soap.
First use on or prior to Dec. 28, 1962.

SN 222,534. Shachihata Kogyo Kabushiki Kaisha, Nishi-ku, Nagoya, Japan. Filed July 2, 1965.

Applicant disclaims the words "Reg'd Trademark" apart from the mark as shown. Owner of U.S. Reg. No. 677,870.

Class 11—Inks and Inking Materials

For Stamp Pads, Rubber Stamps, Ink for Stamp Pads, and Writing Inks, Including Ink Suitable for Fountain and Ball Point Pens.

Class 37—Paper and Stationery

For Writing Instruments—Namely, Fountain Pens, Ball Point Pens, Marking Pens of Both the Felt Core and Synthetic Filament Core Types, Paper Clips and Holders, Stencil Papers, Magnetic Clips and Holders, and Tape Cutters.

First use at least as early as May 5, 1959.

SN 223,202. McCord Corporation, Detroit, Mich. Filed July 13, 1965.

Owner of Reg. Nos. 140,711, 511,687, and others.

Class 19—Vehicles

For Radiators and Radiator Cores.
First use April 1964.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For Mufflers and Lubricators.
First use October 1964.

Class 31—Filters and Refrigerators

For Refrigeration Condensors and Evaporators.
First use July 1964.

Class 34—Heating, Lighting, and Ventilating Apparatus

For Air Conditioning Units and Parts Thereof.
First use July 1964.

Class 35—Belting, Hose, Machinery Packing, and Non-metallic Tires

For Gaskets.
First use October 1964.

SN 225,845. William J. Bennett, d.b.a. Marble Crete Co., Williamsville, N.Y. Filed June 16, 1965.

MARBLE CRETE

Class 12—Construction Materials

For Ingredients for Making Simulated Marble—Namely, Binder Resin, Millers, Including Sand and Calcium Carbonate, Catalysts, Waxes, Marble Chips, Shells and Pigments Mixed With Said Resin and Fillers.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For Metal and Fiberglass Molds and Vibrators.

First use July 3, 1964.

SN 229,669. Midwest Tire Distributors, Inc., Adrian, Mich. Filed Oct. 8, 1965.

The tire design in the drawing is disclaimed apart from the mark.

Class 19—Vehicles

For Shock Absorbers, Creepers, Seat Belts, and Brake System Parts—Namely, Master Cylinders, Wheel Cylinders, and Cylinder Repair Kits.
First use Oct. 10, 1963.

Class 21—Electrical Apparatus, Machines, and Supplies

For Voltage Regulators, Generators, Batteries, and Spark Plugs.
First use Oct. 29, 1964.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For Universal Joints, Exhaust System Parts, Fuel Pumps, and Water Pumps.
First use Jan. 31, 1964.

Class 31—Filters and Refrigerators

For Fuel Filters, Oil Filters, and Air Filters.
First use July 1, 1965.

Class 35—Belting, Hose, Machinery Packing, and Non-metallic Tires

For Fan Belts, Tires, Inner Tubes, Brake Hose, Radiator Hose, and Brake Lining.
First use Sept. 22, 1964.

Subj. to Intf. with SN 224,774.

SN 232,495. Dolly Madison Foods, Inc., Louisville, Ky. Filed Nov. 12, 1965.

The phrase "A Product of Horticultural Research" is disclaimed apart from the mark as shown.

Class 1—Raw or Partly Prepared Materials

For Potting Soil.

Class 10—Fertilizers

For Combination Fertilizer and Mulch.

First use Oct. 19, 1965.

SECTION 2

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Opposition under section 13 may be filed within thirty days of publication. See Rules 2.101 to 2.105.

A fee of twenty-five dollars must accompany the opposition.

[NOTE: For publication of marks presented in a combined application for registration in more than one class, see section 1.]

Class 1—Raw or Partly Prepared Materials

SN 210,744. Commercial Solvents Corporation, New York, N.Y. Filed Jan. 27, 1965.

AQUAMAC

For Polyvinylacetate Copolymer Latex.
First use Mar. 28, 1961.

SN 220,755. France Packing Company, Philadelphia, Pa. Filed June 9, 1965.

FLUR-O-FRAN

For Plastic Material Comprising Fluorocarbon Polymers Blended With One or More Inert Fillers and in the Form of Molding and Extrusion Compositions, and Fabricated Shapes—Namely, Bars, Cylinders, and Blocks.
First use Mar. 19, 1959.

SN 226,506. Beaunit Corporation, New York, N.Y. Filed Aug. 26, 1965.

VYCRON XTRA-TUF

No exclusive right is claimed to "Xtra-Tuf" apart from the mark as shown. Owner of Reg. Nos. 711,387, 711,594, and 712,193.
For Synthetic Staple Fiber.
First use on or about Aug. 5, 1965.

SN 226,980. Archer-Daniels-Midland Company, Minneapolis, Minn. Filed Sept. 2, 1965.

VELVA COAT

No registration rights are claimed for the word "Coat" apart from the mark shown in the drawing, but the applicant waives none of its common law rights in the mark shown in the drawing or any feature thereof.
For Carbonaceous or Non-Carbonaceous Refractory Coating Composition Useful as Washes for Foundry Molds and Cores.
First use in or about December 1963.

SN 229,142. Sinclair-Koppers Company, Pittsburgh, Pa. Filed Oct. 1, 1965.

DYLAR

Owner of Reg. Nos. 631,551 and 645,577.
For Expandable Heterogeneous Thermoplastic Molding Composition.
First use Dec. 21, 1964.

SN 229,777. Embosograf Company of Illinois, Chicago, Ill. Filed Oct. 11, 1965.

EBONITE

For Reflecting Sheets Having Metal Foil Surface for Uses Including the Manufacture of Displays.
First use September 1960.

SN 229,778. Embosograf Company of Illinois, Chicago, Ill. Filed Oct. 11, 1965.

WONDERFLEX

For Reflecting Sheets Having Metal Foil Surface for Uses Including the Manufacture of Displays.
First use July 1964.

SN 233,710. Foseco International Limited, Birmingham, England. Filed Dec. 1, 1965.

SEPAROL

For Chemical Products for Use in Industry—Namely, Liquid Parting Agents for Patterns and Core Boxes and Additives for Foundry Sand Mixes.
First use Dec. 14, 1956; in commerce Dec. 14, 1956.

SN 234,044. Ed. F. Mangelsdorf & Bro., Inc., St. Louis, Mo. Filed Dec. 6, 1965.

BALEBUSTER

For Field Seeds and Grain Seeds.
First use Nov. 16, 1965.

SN 235,593. Sumitomo Bakelite Ltd., d.b.a. Sumitomo Bakelite Company, Ltd., Chiyoda-ku, Tokyo, Japan. Filed Dec. 30, 1965.

SUMILITE

For Plastic Sheets and Sheeting for General Use in the Industrial Arts.
First use December 1954; in commerce October 1964.

SN 236,090. The Goodyear Tire & Rubber Company, Akron, Ohio. Filed Jan. 10, 1966.

TUFLENE

Owner of Reg. No. 804,275.
For Synthetic Rubber.
First use Dec. 21, 1965.

SN 236,825. International Paper Company, New York, N.Y. Filed Jan. 19, 1966.

INTERNATIONAL

Owner of Reg. Nos. 732,500, 790,720, and others.
For Wood Pulp.
First use December 1963.

SN 237,433. Dairyland Seed Company, Inc., Campbellsport, Wis. Filed Jan. 27, 1966.

FRENCHEE

For Farm Seeds.
First use on or about Mar. 14, 1960.

SN 238,824. Acme Backing Corporation, New York, N.Y. Filed Feb. 15, 1966.

FLEXLOK

For Laminated Sheet Material, Including Synthetic Resin Films or Foils, Fabric and/or Paper, for General Use in the Industrial Arts.
First use Jan. 26, 1966.

SN 243,031. St. Regis Paper Company, New York, N.Y. Filed Apr. 8, 1966.

ST REGIS

Owner of Reg. Nos. 377,917, 712,869, and others.
For Plastic Film and Sheet Material Comprising Cellophane, and Polyolefins, Laminated Sheet Material Having Fire Extinguishing Properties for Packaging, Construction Purposes and Vapor Barriers.
First use on or about Jan. 19, 1965.

Class 2—Receptacles

SN 188,222. Euclid Spiral Paper Tube Corp., Cleveland, Ohio. Filed Mar. 9, 1964.

EUCLID

No registration rights are claimed for the representation of the goods apart from the mark shown in the drawing, but applicant waives none of its common law rights in the mark shown in the drawing or any feature thereof.
For Paper Tubes, and Combined Paper and Plastic or the Like Laminated Tubes Adapted for Use as Mailing Tubes, Article-Enclosing or Article-Encapsulating Packages, and Cores for Receiving Windings of Paper, Electrical Wiring or Other Material.
First use Nov. 1, 1963.

SN 214,954. Columbia Corrugated Container Corp., Syosset, N.Y. Filed Mar. 25, 1965.

LIVE-PAK

For Corrugated Paper Boxes for Containing Articles of Merchandise.
First use Dec. 1, 1964.

SN 221,188. Lanco Container Corp., Brooklyn, N.Y. Filed June 15, 1965.

LANCO SNAP INS

For Tubular Protective Sleeve Made of Corrugated Paperboard and Open at Both Ends for Supporting Fragile or Breakable Products Such as a Bottle or the Like Between Ends of the Sleeve.
First use May 18, 1965.

SN 221,253. Theresa P. Carey, Minneapolis, Minn. Filed June 16, 1965.

DOLLY-UP

For Cosmetic Trays Sold Empty.
First use May 28, 1965.

SN 222,760. The Harold E. Saper Company, Chicago, Ill. Filed July 6, 1965.

HESCO

For Disposable Vacuum Filter Bags for Vacuum Cleaners.
First use in or about July 1959.

SN 222,799. Albemarle Paper Manufacturing Company, d.b.a. Consumer Bag and Packaging Corporation, Richmond, Va. Filed July 7, 1965.

DUO-SERVICE

For Paper Bags.
First use June 1, 1965.

SN 223,255. Olin Mathieson Chemical Corporation, New York, N.Y. Filed July 13, 1965.

RUFF-RIDER

For Paper and Paperboard Cartons and Boxes.
First use Aug. 29, 1962.

SN 234,664. Edward J. Paprocki, d.b.a. Ever Ready Machine & Die Co., Brooklyn, N.Y. Filed Dec. 15, 1965.

The GOLDEN STEIN

Without waiver of common-law and other rights, no registration rights are claimed for the words "The" and "Stein" apart from the complete mark.
For Combined Coaster and Holder for Converting Beverage Cans and Other Containers Into Stein-Like Objects.
First use Nov. 30, 1965.

Class 3—Baggage, Animal Equipments, Portfolios, and Pocketbooks

SN 219,406. H. E. Dial and MacDonald Millard (joint owners), Calgary, Alberta, Canada. Filed May 21, 1965.

The expression "Pak-A-Book" is disclaimed apart from the mark as shown.
For Satchels Designed To Carry Books.
First use Apr. 22, 1965; in commerce Apr. 22, 1965.

SN 223,402. Gimbel Brothers, Inc., New York, N.Y. Filed July 15, 1965.

Regency

For Luggage.
First use Oct. 15, 1963.

SN 231,942. Rico Leather Specialty Inc., Chicago, Ill. Filed Nov. 1, 1965.

For my money it's Rico

Owner of Reg. Nos. 442,182 and 627,182.
For Ladies' and Men's Billfolds, Pass Cases, Pocket Secretaries, and Money Clips.
First use October 1955.

Class 4—Abrasives and Polishing Materials

SN 221,908. Eberhard Faber Inc., Wilkes-Barre, Pa. Filed June 24, 1965.

E. FABER

Owner of Reg. Nos. 129,700, 699,426, and others.
For Steel Polish.
First use June 22, 1907.

SN 221,913. Eberhard Faber Inc., Wilkes-Barre, Pa. Filed June 24, 1965.

EBERHARD FABER

Owner of Reg. Nos. 129,700, 699,426, and others.
For Steel Polish.
First use June 22, 1907.

Class 5—Adhesives

SN 221,909. Eberhard Faber Inc., Wilkes-Barre, Pa. Filed June 24, 1965.

E. FABER

Owner of Reg. Nos. 129,700, 699,426, and others.
For Plastic Adhesive.
First use May 20, 1960.

SN 221,914. Eberhard Faber Inc., Wilkes-Barre, Pa. Filed June 24, 1965.

EBERHARD FABER

Owner of Reg. Nos. 129,700, 699,426, and others.
For Plastic Adhesive.
First use May 20, 1960.

SN 222,173. Lowell Bearing Company, Chicago, Ill. Filed June 28, 1965.

BEACON

For Vinyl Adhesive Tapes, Friction Tapes, and Masking Tapes.
First use on or about Apr. 26, 1965.

Class 6—Chemicals and Chemical Compositions

SN 223,027. Daly-Herring Company, Kinston, N.C. Filed July 9, 1965.

D-H

The drawing is lined for red. Owner of Reg. Nos. 501,914 and 525,767.
For Agricultural Chemicals—Namely, Insecticides, Herbicides, Fungicides, and Wood Preservative.
First use 1960.

SN 224,264. Technic, Inc., Cranston, R.I. Filed July 26, 1965.

TARNIBAN

For Chemical Composition for a Tarnish Preventative for Silver, Silver Electroplate, Copper, Copper Alloys, Brass, and Gold Plated Silver and Gold Plated Copper.
First use Nov. 18, 1964.

SN 224,291. American Gas & Chemicals, Inc., New York, N.Y. Filed July 27, 1965.

BUG·IT

For Combination Tamper Indicator and Leak Detector in Chemical Form.
First use July 16, 1965.

SN 224,937. Dade Reagents, Inc., Miami, Fla. Filed Aug. 4, 1965.

ERYTHRO-TROL

Owner of Reg. Nos. 603,181, 779,695, and others.
For Diagnostic Reagent Standardized Suspension of Human Red Blood Cells for Use as a Laboratory Control in Cell-Counting Procedures.
First use on or before June 5, 1965.

SN 225,041. MacCleaster Chemical Company Limited, London, England. Filed Aug. 5, 1965.

DOX-ANODE

Owner of British Reg. No. 781,353, dated Sept. 1, 1958.
For Anti-Corrosive Coatings for Ferrous Metals.

SN 226,880. American Gas & Chemicals, Inc., New York, N.Y. Filed Sept. 1, 1965.

For Chemical Specialties and Impregnated Sheets, Tabs, and Laminate for Detecting Leaks in Fluid Systems.
First use May 12, 1965.

SN 228,449. W. F. Fancourt Co., Inc., Greensboro, N.C. Filed Sept. 23, 1965.

VIBRALURE

For Industrial Chemical, Which Is a Resinous Emulsion, Used To Finish Tricot Textile Fabrics by Softening the Synthetic Fibers Contained in the Knitted Fabric, and by Implanting Anti-Static Properties in Such Fabric.
First use Aug. 24, 1964.

SN 230,529. Fritzsche Brothers, Inc., New York, N.Y. Filed Oct. 19, 1965.

INDOLIQUE

For Fragrances for Use in the Manufacture of Perfume, for Manufacturing and Professional Use Only.
First use Sept. 23, 1965.

SN 232,036. Trager Manufacturing Company, Scranton, Pa. Filed Nov. 2, 1965.

Sea Mist Products
The Household Help Women Can Trust

No exclusive claim is made to the word "Products" or to the words "The Household Help Women Can Trust" apart from the mark as shown. Owner of Reg. Nos. 637,012 and 773,821.
For Household Ammonia With Pine Detergent, Laundry Spray Starch, and Household Liquid Disinfectant Concentrate With Deodorant Properties.
First use Sept. 1, 1962.

SN 232,713. Nease Chemical Company, Inc., State College, Pa. Filed Nov. 15, 1965.

HIO-DINE

Owner of Reg. Nos. 719,842 and 719,843.
For Compositions for Water Purification, Especially Swimming Pool Water Disinfection and Sanitization.
First use May 10, 1960.

SN 233,590. Foseco International Limited, Birmingham, England. Filed Nov. 30, 1965.

STELOTOL

Owner of British Reg. No. 844,755, dated Feb. 6, 1963.
For Chemical Products for Use in the Treatment of Molten Metals—Namely, Compositions for Carbon-Black Coating of Ingot Molds.
First use Aug. 4, 1964; in commerce Aug. 4, 1964.

SN 233,707. Foseco International Limited, Birmingham, England. Filed Dec. 1, 1965.

DEXIL

Owner of British Reg. No. 802,331, dated Feb. 26, 1960.
For Chemical Products for Use in the Foundry Industry—Namely, Breakdown Agents for Sodium Silicate Bonded Sand Cores.
First use Jan. 30, 1961; in commerce Jan. 30, 1961.

SN 233,708. Foseco International Limited, Birmingham, England. Filed Dec. 1, 1965.

DYCOTE

For Chemical Substances Employed in the Foundry Industry—Namely, Surfacing Compositions for Application to Permanent Molds and Furnace Tools for Effecting Heat Insulation, Surface Modification, or Lubrication and Heat Conduction.
First use Nov. 9, 1945; in commerce Nov. 9, 1945.

SN 233,757. Tide Products, Inc., Edinburg, Tex. Filed Dec. 1, 1965.

FARMACY

For Agricultural Chemicals—Namely, an Agricultural Insecticide, an Agricultural Fungicide, an Agricultural Defoliant, and an Agricultural Surfactant.
First use on or about Oct. 29, 1965.

SN 233,779. Casting Materials Company, Inc., White Plains, N.Y. Filed Dec. 2, 1965.

POSTALOY

Owner of Reg. Nos. 636,316 and 637,014.
For Mixture of Chemical Preparations Used in the Processing of Molten Metals.
First use on or about Apr. 15, 1965.

SN 234,215. The Lea Manufacturing Co., Waterbury, Conn. Filed Dec. 8, 1965.

LEA ANTISTAT

Owner of Reg. Nos. 274,639, 722,460, and others.
For Solution for Neutralising Electrostatic Charge Buildup on Plastics and Other Non-Metallic Surfaces.
First use May 7, 1964.

SN 236,616. Masury-Young Company, Melrose Park, Ill. Filed Jan. 17, 1966.

DURATROL

For Chemical Preparation for Treatment of Fabrics To Impart Flame Retardant Properties or Dust Control Properties.
First use Oct. 6, 1965.

SN 236,617. Masury-Young Company, Melrose Park, Ill. Filed Jan. 17, 1966.

SABOA-100

For Chemical Preparation for Waterproofing Fabrics.
First use Oct. 26, 1965.

SN 236,704. American Cyanamid Company, Wayne, N.J. Filed Jan. 18, 1966.

AEROCAT TRIPLE-S

Owner of Reg. Nos. 434,875 and 622,502.
For Cracking Catalyst for Use in Catalytic Cracking Processes for the Refining of Petroleum.
First use Oct. 27, 1965.

SN 236,774. Pittsburgh Plate Glass Company, Pittsburgh, Pa. Filed Jan. 18, 1966.

CHEM HOE

For Selective Herbicides.
First use at least as early as Dec. 3, 1963.

SN 236,834. Mackenzie Chemical Works, Inc., Central Islip, N.Y. Filed Jan. 19, 1966.

EQUOL

For Photographic Developer.
First use Oct. 26, 1965.

SN 236,873. Amchem Products, Inc., Ambler, Pa. Filed Jan. 20, 1966.

BROMINIL

For Herbicides.
First use Sept. 21, 1965.

SN 236,997. The Ironees Company, Philadelphia, Pa. Filed Jan. 21, 1966.

PRESST

For Composition for Imparting Permanent Crease to Fabrics.
First use Jan. 10, 1966.

SN 236,998. The Ironees Company, Philadelphia, Pa. Filed Jan. 21, 1966.

IRONEES

For Composition for Imparting Permanent Crease to Fabrics.
First use Jan. 10, 1966.

SN 237,021. Chas. Pfizer & Co., Inc., New York, N.Y. Filed Jan. 21, 1966.

KROMAROON

Owner of Reg. No. 589,622.
For Finely Divided Pigment Having a Variety of Industrial Uses.
First use Jan. 7, 1964.

SN 237,076. Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen (Rhine), Germany. Filed Jan. 24, 1966.

IMPLENAL

For Chemicals and Chemical Compounds as Tanning Agents for the Leather Industry.
First use Oct. 12, 1911; in commerce Mar. 14, 1963.

SN 237,100. E. I. du Pont de Nemours and Company, Wilmington, Del. Filed Jan. 24, 1966.

RYLEX

For Ultraviolet Light Absorbers.
First use Dec. 20, 1965.

SN 237,312. Clay-Adams, Inc., New York, N.Y. Filed Jan. 26, 1966.

HISTOCLAD

For Synthetic Microscopic Mounting Medium.
First use in or about August 1963.

SN 237,419. The Ansul Company, Marinette, Wis. Filed Jan. 27, 1966.

PHYTAR

For Herbicide.
First use Dec. 23, 1965.

SN 237,878. The Sinclair Manufacturing Company, d.b.a. Sinclair Manufacturing Company, Toledo, Ohio. Filed Feb. 2, 1966.

SPRITE

Owner of Reg. No. 544,236.
For Fabric Softener Liquid.
First use Aug. 28, 1965.

SN 237,879. The Sinclair Manufacturing Company, Toledo, Ohio. Filed Feb. 2, 1966.

CINDY

Owner of Reg. No. 746,349.
For Fabric Softener Liquid.
First use Aug. 5, 1965.

SN 238,282. Chas. Pfizer & Co., Inc., New York, N.Y. Filed Feb. 7, 1966.

AS-50

Owner of Reg. No. 616,729.
For Antibiotic Preparation for Agricultural Use for Controlling Plant Diseases.
First use in or about April 1958.

SN 238,438. The Met-L-Chek Co., Los Angeles, Calif. Filed Feb. 9, 1966.

MET-L-CHEK

For Chemical Dyes and Developers for Detecting and Making Visible to the Eye Cracks and Other Surface Defects in the Surface of Any Metal, Glass, and Thermo-Setting Plastics.
First use June 15, 1951.

SN 238,480. American Potash & Chemical Corporation, Los Angeles, Calif. Filed Feb. 10, 1966.

TRONOX

Owner of Reg. No. 769,354.
For Titanium Dioxide, Pigments, Titanium Dioxide Pigments and Formulations Containing Titanium Dioxide.
First use Nov. 10, 1965.

SN 243,151. Marlyn Chemical Company, Inc., Lakeview, Ohio. Filed Apr. 11, 1966.

For Powdered Fabric Softener.
First use May 21, 1956.

Class 8 — Smokers' Articles, Not Including Tobacco Products

SN 235,531. Sasieni Ltd., London, England. Filed Dec. 29, 1965.

Sasieni
·· TWO 2 DOT ··

Owner of U.S. Reg. Nos. 188,328 and 568,366.
For Smokers' Pipes.
First use June 11, 1965; in commerce June 11, 1965; April 1922 as to "Sasieni."

Class 9 — Explosives, Firearms, Equipments, and Projectiles

SN 209,051. American Cyanamid Company, Wayne, N.J. Filed Dec. 30, 1964.

CYAN-FO

Owner of Reg. No. 667,921.
For Blasting Agent.
First use May 28, 1963.

SN 223,340. Penguin Associates, Inc., Malvern, Pa. Filed July 14, 1965.

DEPUTY

For Tear Gas Spray.
First use July 6, 1965.

SN 228,972. American Cyanamid Company, Wayne, N.J. Filed Sept. 30, 1965.

HI-PRIME

For Explosives.
First use June 21, 1965.

Class 11 — Inks and Inking Materials

SN 235,930. Pacific Industries, Inc., New York, N.Y. Filed Jan. 6, 1966.

HOT Spot

For Carbonizing Ink.
First use Dec. 21, 1964.

Class 12 — Construction Materials

SN 189,665. Agway, Inc., Syracuse, N.Y., by merger of Cooperative Grange League Federation Exchange, Ithaca, N.Y. Filed Mar. 26, 1964.

AGWAY

For Ready Mixed Hydraulic Cement, Composition Roofing, Laminated Rafters, Laminated Building Panels, Building Insulating Material, Storm Windows, Storm Doors, Metal Siding, Asphalt Siding, Treated Wood Poles, Sheathing Paper, Steel Posts, Blacktop Driveway Sealer, Wooden Farm Gates, and Caulking Compound.
First use Mar. 5, 1964.

SN 199,365. Hallcraft Homes, Inc., Scottsdale, Ariz. Filed Aug. 6, 1964.

HALLCRAFT HOMES

Applicant disclaims the word "Homes" apart from the mark as shown.
For Homes, Townhouses, Side-By-Side Dwellings, Individual One-Story Dwellings, Multiple One-Story Dwellings, Individual Split-Level Dwellings, and Multiple Split-Level Dwellings.
First use September 1963.

SN 203,170. Hallcraft Homes, Inc., Scottsdale, Ariz. Filed Oct. 2, 1964.

HALLCRAFT TOWNHOUSES

Applicant disclaims the word "Townhouses" apart from the mark as shown.
For Homes, Townhouses, Side-By-Side Dwellings, Individual One-Story Dwellings, Multiple One-Story Dwellings, Individual Split-Level Dwellings, and Multiple Split-Level Dwellings.
First use September 1963.

SN 206,710. The Flintkote Company, New York, N.Y. Filed Nov. 23, 1964.

UNIMASTIC

For Vapor Barrier and/or Breathable Coating and Fibrous Reinforcing Agents Therefor.
First use March 1964.

SN 226,660. Howmet Corporation, New York, N.Y., by change of name from Howe Sound Company, Dallas, Tex. Filed Aug. 27, 1965.

VEE-LITE

For Panels for Use as Facing of Commercial and Industrial Buildings.
First use Apr. 28, 1965.

SN 227,497. Griffolyn Co., Inc., Houston, Tex. Filed Sept. 9, 1965.

TerraTape

For Plastic Tape To Be Laid Over Subterranean Structures as a Locator Device.
First use at least as early as Aug. 16, 1965.

SN 228,453. The Flintkote Company, New York, N.Y. Filed Sept. 23, 1965.

GREEN TAG

For Gypsum Plaster for Pottery and Molds.
First use Nov. 14, 1931.

SN 228,455. The Flintkote Company, New York, N.Y. Filed Sept. 23, 1965.

RED TAG

For Gypsum Plaster for Pottery and Molds.
First use Feb. 29, 1936.

SN 228,872. Amsterdam Corporation, New York, N.Y. Filed Sept. 29, 1965.

VICO CERAM-1-LOK

For Ceramic Tiles Sealed and Bonded in Vinyl Resins and Sold in Sheets.
First use July 30, 1965.

SN 229,243. Hass Wholesale, Inc., South Bend, Ind. Filed Oct. 4, 1965.

For Premixed Concrete and Premixed Mortar.
First use Aug. 26, 1965.

SN 229,983. Oklahoma Cement Company, Dallas, Tex. Filed Oct. 12, 1965.

RICH-MIX

For Masonry Cement.
First use July 27, 1965.

SN 231,704. Societe pour Recherches Scientifiques et Chimiques S.A., Lausanne, Switzerland. Filed Oct. 27, 1965.

FARBOTHERME

Priority claimed under Sec. 44(d) on Swiss Reg. No. 210,131, dated Apr. 29, 1965.
For Products for the Building Industry—Namely, Liquid Coatings for Protection Against Moisture, and for Sound and Heat Insulation.

SN 232,939. Smith Products, Inc., d.b.a. Childers Products Co., Cleveland, Ohio. Filed Nov. 18, 1965.

SLIP-CLIP

For Prefabricated Insulation Jacketing With Fasteners Therefor.
First use Apr. 16, 1965.

SN 233,290. Vesuvius Crucible Company, Pittsburgh, Pa. Filed Nov. 24, 1965.

MORLOK

For Refractory Mixes and Cements.
First use Oct. 28, 1965.

SN 236,733. The Euclid Chemical Company, Cleveland, Ohio. Filed Jan. 18, 1966.

FIRMIX GROUT

The word "Grout" is disclaimed.
For Shrinkproof Grout for Use in the Placement of Machinery and the Erection of Structural Members, Consisting of Graded Iron Aggregates, Set Accelerators, Cement Dispersing Agents, and Oxidizing Catalyst, Cement, and Sand.
First use on or about June 1, 1962.

Class 13—Hardware and Plumbing and Steam-Fitting Supplies

SN 226,927. Lavelle Rubber Company, Chicago, Ill. Filed Sept. 1, 1965.

LAVELLE

For Plumbing Specialties in the Nature of Faucet Repair Kits, Sink Stoppers, Tank Balls, Force Cups, Toilet Plungers, and the Like.
First use Jan. 15, 1961.

SN 227,235. Black, Sivalls & Bryson, Inc., Kansas City, Mo. Filed Sept. 7, 1965.

STA-KUL

For Safety Valve.
First use February 1960.

SN 227,357. Taylor Forge & Pipe Works, Bellwood, Ill. Filed Sept. 7, 1965.

TF
Traditionally Dependable

No claim is made to the words "Traditionally Dependable" apart from the mark as a whole. Owner of Reg. No. 535,666.
For Metal Pipe, Pipe Fittings and Flanges.
First use June 25, 1964; Jan. 5, 1949, as to "TF."

SN 232,453. Dorfile Manufacturing Company, Portland, Oreg.. Filed Nov. 10, 1965.

DECORET

For Shelf Brackets, Shelf Standards, and Floor to Ceiling Poles.
First use May 26, 1965.

SN 236,748. William R. Hartnell, Los Angeles, Calif. Filed Jan. 18, 1966.

For Builders' Hardware.
First use Nov. 9, 1964.

SN 237,300. Calumet & Hecla, Inc., Allen Park, Mich. Filed Jan. 26, 1966.

STUB/OUT

For Tubing Spun on the End and Sold as a Complete Unit for Testing Plumbing Systems.
First use Apr. 19, 1965.

Class 15—Oils and Greases

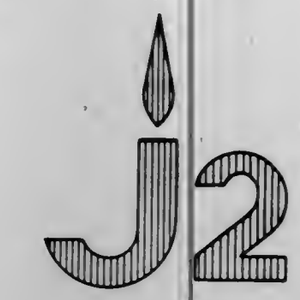
SN 189,667. Agway, Inc., Syracuse, N.Y., by merger of Cooperative Grange League Federation Exchange, Inc., Ithaca, N.Y. Filed Mar. 26, 1964.

AGWAY

For Motor Oil, Gear Oil, Viscous Grease, Diesel Fuel, Heating Fuel Oil, Fuel Additives, Gasoline, and Kerosene.
First use Mar. 5, 1964.

SN 235,425. Quaker Oil Corporation, St. Louis, Mo. Filed Dec. 28, 1965.

PENETREX



For Motor Oils.
First use February 1953.

SN 241,677. Norton Company, Watervliet, N.Y. Filed Mar. 23, 1966.

Owner of Reg. Nos. 659,968, 684,599, and others.
For Mineral Oil—Namely, a General-Purpose Lubricating and Sharpening Oil.
First use on or before Dec. 1, 1961.

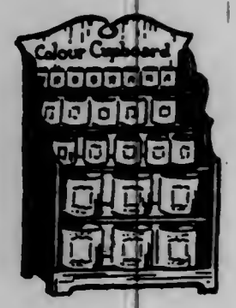
SN 242,017. Japan Gas Lighter Corp., New York, N.Y. Filed Mar. 28, 1966.

The drawing is lined for the color "Red," but this is not claimed as a feature of the mark.
For Butane Fuel Gas in a Dispenser-Container for Cigar and Cigarette Lighters.
First use Aug. 5, 1965.

SN 246,652. Vernon L. Cannon, d.b.a. Hol-Can Oil Company, Dothan, Ala. Filed May 26, 1966.

CANNON

For Lubricating Greases.
First use Apr. 18, 1966.



Class 16 — Protective and Decorative Coatings

SN 221,645. Sherman Car Wash Equipment Co., Palmyra, N.J. Filed June 21, 1965.

GLO-WAX

For Rinsing Solution That Leaves a Protective Coating, and Concentrate Therefor, for Use in Car Wash Systems.
First use Mar. 1, 1965.

SN 230,961. Turco Paint & Varnish Co., Inc., Philadelphia, Pa. Filed Oct. 21, 1965.

For Oil or Water Base Semi-Gloss, Low Sheen, All-Purpose Indoor and Outdoor Paints.
First use Aug. 18, 1965.

SN 239,460. Texas Instruments Incorporated, Dallas, Tex. Filed Feb. 23, 1966.

TI-KOTE

For Protective Refractory Coatings—Namely, Silicon Carbide Coatings for Machined Articles of Manufacture Such as Paper-Making Machine Suction Box Covers.
First use May 9, 1962.

Class 17 — Tobacco Products

SN 222,280. Kessing & Thiele, Buende, Westphalia, Germany. Filed June 29, 1965.

The name of the applicant and the pictorial representation of the goods, are disclaimed apart from the mark as shown. The English translation of the words "Die Hand der Firma" is "the hand of the firm." Owner of German Reg. No. 444,337, dated July 2, 1931.
For Tobacco, Cigars and Cigarillos.
First use March 1925; in commerce Aug. 14, 1956.

SN 227,155. Kessing & Thiele, Buende, Westphalia, Germany. Filed Sept. 3, 1965.

SPORTSTUDENT

Owner of German Reg. No. 435,097, dated May 13, 1931.
For Tobacco, Cigars, and Cigarillos.
First use 1925; in commerce 1955.

SN 227,156. Kessing & Thiele, Buende, Westphalia, Germany. Filed Sept. 3, 1965.

GOLDANKER

The English translation of the word "Goldanker" is "gold anchor." Owner of German Reg. No. 616,426, dated June 23, 1950.
For Cigars and Cigarillos.
First use 1935; in commerce 1955.

SN 234,721. Arnold André, Buende, Westphalia, Germany. Filed Dec. 16, 1965.

Prisma

Owner of German Reg. No. 788,121, dated Mar. 20, 1964.
For Raw Tobacco, Tobacco Products—Namely, Cigars, Cigarillos, Cheroots, Smoking and Chewing Tobacco, and Cigarettes.

Class 18 — Medicines and Pharmaceutical Preparations

SN 218,506. The Vitarine Co., Inc., Springfield Gardens, N.Y. Filed May 10, 1965.

For Pharmaceutical and Medicinal Preparations.
First use Sept. 25, 1964; in 1934 as to "Vitarine."

SN 224,507. Byk-Gulden Lomberg Chemische Fabrik GmbH, Konstanz, Germany. Filed July 29, 1965.

BYKONOX

Owner of German Reg. No. 776,666, dated June 26, 1963.
For Drug for the Treatment of Anxiety and Tension, Insomnia, Restlessness, Convulsive Disorders, and Sedative After Operations.

SN 224,821. Vit-A-Way, Inc., Fort Worth, Tex. Filed Aug. 2, 1965.

DAIRY PRIMER

For Protein, Mineral and Vitamin Feed Supplement for Livestock.
First use Jan. 1, 1965.

SN 226,784. Pure Pharmacal Company, Houston, Tex. Filed Aug. 30, 1965.

BIOTEX

For Antibiotic Ointment.
First use at least as early as July 6, 1965.

SN 227,525. Sherman Laboratories, Detroit, Mich. Filed Sept. 9, 1965.

The representation of a caduceus is disclaimed apart from the mark as shown.
For Pharmaceutical Preparations.
First use 1934.

SN 229,164. Wonder-Lin Manufacturing Company, Wilkes-Barre, Pa. Filed Oct. 1, 1965.

WONDER-LIN

For Non-Rubbing Liniment for Relieving Rheumatic Pains, Sprains, Bruises, Swellings, and Congestion.
First use on or about Apr. 1, 1934.

SN 232,838. Imperial Chemical Industries Limited, Millbank, London, England. Filed Nov. 17, 1965.

PARAMEZ

Owner of British Reg. No. 865,919, dated June 23, 1964.
For Pharmaceutical Preparations for the Treatment of Coccidiosis in Poultry.

SN 234,706. William H. Rorer, Inc., Fort Washington, Pa. Filed Dec. 14, 1965.

VARETS

For Throat Losenges.
First use Nov. 9, 1965.

SN 236,855. Cerbini Laboratories, Inc., New Rochelle, N.Y. Filed Jan. 13, 1966.

ACERBINE

For Antiseptic Preparation for Treatment of Burns and Varicose Ulcers.
First use Mar. 3, 1965.

SN 236,705. American Pharmaceutical Company, New York, N.Y. Filed Jan. 18, 1966.

BABY LOVE

The word "Baby" is disclaimed apart from the mark as a whole.
For Medicated Skin Preparation for Diaper Rash.
First use on or about Dec. 20, 1965.

SN 236,943. Youngs Drug Products Corporation, New York, N.Y. Filed Jan. 20, 1966.

Owner of Reg. Nos. 709,267, 726,677, and others.
For Medicinal Preparation To Treat and Prevent Athlete's Foot.
First use May 26, 1960.

SN 236,945. Youngs Drug Products Corporation, New York, N.Y. Filed Jan. 20, 1966.

Owner of Reg. Nos. 709,267, 726,677, and others.
For Medicinal Preparation To Control Foot Odor and To Help Prevent the Recurrence of Athlete's Foot.
First use June 1, 1961.

SN 237,141. Raynor Mead, d.b.a. Mead Laboratory, Bronx, N.Y. Filed Jan. 24, 1966.

BIS-MINT

For Antacid Tablets.
First use Apr. 1, 1927.

SN 237,443. Fisons Pharmaceuticals Limited, Loughborough, England. Filed Jan. 27, 1966.

LOMODEX

Owner of British Reg. No. 866,443, dated July 8, 1964.
For Dextran.

SN 237,716. The Macbick Company, Wilmington, Mass. Filed Feb. 1, 1966.

BARIMEX

For Barium Sulfate Compound and Composition for Use in Enema Preparations.
First use Jan. 18, 1965.

SN 238,050. Cole Pharmacal Company, Inc., d.b.a. Cole Chemical Co. and Cole Chemical Company, St. Louis, Mo. Filed Feb. 4, 1966.

DERFULE

For Preparation for Temporary Relief of Minor Aches and Pains Due to the Common Cold.
First use July 17, 1941.

SN 238,052. Cole Pharmacal Company, Inc., d.b.a. Cole Chemical Co. and Cole Chemical Company, St. Louis, Mo. Filed Feb. 4, 1966.

ERGOTATROPIN

For Preparation for Relief of Migraine Headaches, Cluster and Vascular Headaches.
First use Aug. 14, 1957.

SN 239,316. Reed & Carnrick, Kenilworth, N.J. Filed Feb. 21, 1966.

PROCTOFOAM

For Pharmaceutical Preparation for the Treatment of Proctological Disorders.
First use on or about Feb. 1, 1966.

SN 239,586. C-B Drug Company, Charlotte, N.C. Filed Feb. 25, 1966.

PRESCRIPTION 98

Applicant disclaims the word "Prescription" apart from the mark as shown, without waiving any of its common law rights thereto.
For Cold Medicine.
First use on or about July 1, 1938.

SN 239,592. Ciba Corporation, New York, N.Y. Filed Feb. 25, 1966.

VETITRAN

For Veterinary Preparation for Tranquilizing Animals.
First use Feb. 18, 1966.

SN 239,620. Harcliffe Laboratories, Inc., Brooklyn, N.Y. Filed Feb. 25, 1966.

GRAVILOSE

For Anti-Nausea Tablets.
First use Feb. 3, 1966.

SN 239,742. The Cramer Chemical Company, Gardner, Kans. Filed Feb. 28, 1966.

MICRO-C

For Antiseptic Foot and Body Powder.
First use Dec. 15, 1965.

SN 239,797. Pure Pharmacal Company, Houston, Tex. Filed Feb. 28, 1966.

HAY-HIST

For Capsules for Relief of Hay Fever Symptoms.
First use at least as early as July 1, 1964.

SN 243,977. Geigy Chemical Corporation, Ardsley, N.Y. Filed Apr. 21, 1966.

RELORIN

For Hematinic Preparation.
First use Apr. 1, 1966.

Class 19—Vehicles

SN 208,543. Chris-Craft Industries, Inc., Oakland, Calif., assignee of Chris-Craft Corporation, Pompano Beach, Fla. Filed Dec. 21, 1964.

SEA SKIFF Chris-Craft

No registration rights are claimed for the words "Sea Skiff" apart from the mark shown, but the applicant waives none of its common law rights in the mark shown nor any feature thereof. Owner of Reg. Nos. 622,581, 737,045, and 774,868.
For Boats.
First use Mar. 17, 1960; Feb. 9, 1954, in a different form.

SN 216,855. Molded Fiber Glass Body Company, Union City, Pa. Filed Apr. 19, 1965.

FORD 20

Applicant disclaims the numeral "20" apart from the mark as shown.
For Small Boats for Cruising and Sailing.
First use in or about September 1962.

SN 217,892. Highway Cruisers, Inc., Covina, Calif., by change of name from Highway Cruisers of California Inc., Covina, Calif. Filed May 3, 1965.

SportsBac

Owner of Reg. No. 691,191.
For Enclosures Adapted To Be Mounted on Beds of Trucks for Converting Trucks Into Campers.
First use Sept. 29, 1964.

SN 221,305. Seilon, Inc., Barberton, Ohio. Filed June 16, 1965.

SEILON 303

Owner of Reg. No. 583,179.
For Vinyl Car Mats.
First use Mar. 10, 1965.

SN 225,254. American Supramar Corporation, Washington, D.C. Filed Aug. 9, 1965.

Suprafoil

For Hydrofoil Used on Water Craft, Such as Ferries, Pleasure Boats, Military Boats, and the Like.
First use Mar. 12, 1965.

SN 225,255. American Supramar Corporation, Washington, D.C. Filed Aug. 9, 1965.

a Supramar product

The word "Product" is disclaimed apart from the mark as shown.
For Hydrofoil Used on Water Craft, Such as Ferries, Pleasure Boats, Military Boats, and the Like.
First use Mar. 12, 1965.

SN 229,177. Arnold, Schwinn & Co., Chicago, Ill. Filed Oct. 4, 1965.

Miss Teen

For Bicycles.
First use Sept. 13, 1965.

SN 229,326. Aeronca Manufacturing Corporation, Middletown, Ohio. Filed Oct. 5, 1965.

MODU-CAR

For Hopper-Type Railroad Cars.
First use Aug. 17, 1965.

SN 235,741. United Distributors Service, Inc., Roanoke, Va. Filed Jan. 3, 1966.

UDS

For Automobile Parts and Accessories—Namely, Pedal Pads, Accelerator Pedals, Stabilizer Repair Kits, and Bushing Repair Kits.
First use Aug. 12, 1964.

SN 243,130. D. P. Harris Hardware & Manufacturing Co., Inc., New York, N.Y. Filed Apr. 11, 1966.

AMERICAN FLYER

Owner of Reg. Nos. 545,154 and 703,164.
For Bicycles.
First use 1907.

Class 20—Linoleum and Oiled Cloth

SN 231,892. Custom Vinyl Ltd., Brooklyn, N.Y. Filed Nov. 1, 1965.

NOBELLE

For Floor Coverings in the Form of Tiles of Vinyl or Vinyl Asbestos of Distinctive Patterns and Colors.
First use Oct. 1, 1965.

Class 21—Electrical Apparatus, Machines, and Supplies

SN 197,272. Electronic Treasure Chest Enterprises, Inc., Waukegan, Ill. Filed July 7, 1964.

ELECTRONIC Treasure Chest

No claim is made to the exclusive use of the term "Electronic" apart from the mark as shown.
For Container Provided With One or More Slot-Like Openings for Insertion of a Card Bearing Indicia Which Are Scanned by Electrical Apparatus Within Container.
First use Nov. 7, 1961.

SN 209,725. Phillips Manufacturing Company, Inc., Minneapolis, Minn. Filed Jan. 11, 1965.

ZERO START

Owner of Reg. No. 670,862.
For Electric Stock Tank Heaters, Electrical Starting Aid Kits, Starting Fluid Injectors, Electric Dip Stick Heaters, Electric Head-Bolt Heaters, Electric Frost Plug Heaters, Electric External Tank-Type Heaters, Electric Oil Pan Heaters, Electric Diesel Engine Block Heaters, and Electric Battery Warmers.
First use on or about Jan. 1, 1950.

SN 224,522. CIT—Compagnie Industrielle des Telecommunications, Paris, France. Filed July 29, 1965.

COMPELEC

Owner of French Reg. No. 494,470, dated Feb. 24, 1961 (Seine); Natl. Inst. No. 159,677.
For Semi-Conductors; Sub-Assemblies for Radio and Television, and Parts Thereof.

SN 225,175. Midvale-Heppenstall Company, Philadelphia, Pa. Filed Aug. 6, 1965.

MID MH MAC

For Electrolytic Machining Apparatus.
First use Jan. 15, 1965.

SN 228,971. American Bosch Arma Corporation, Springfield, Mass. Filed Sept. 30, 1965.

MAG-TRONIC

Owner of Reg. No. 777,760.
For Ignition System for Internal Combustion Engines.
First use Aug. 26, 1965.

SN 232,119. Dunkermotoren Prazisions-Kleinstmotoren Gesellschaft mbH, 7823 Bonndorf, Black Forest, Germany. Filed Nov. 4, 1965.

dunkermotoren

The English translation of "Dunkermotoren" is "Dunker motors."
For Electric Motors.
First use in or about January 1957; in commerce in or about December 1957.

SN 232,960. Aluminum Housewares Co., Inc., St. Louis, Mo. Filed Nov. 19, 1965.

V.I.U. LITE

The word "Lite" is disclaimed apart from the mark as shown.
For Electric Lamps.
First use Nov. 16, 1965.

SN 239,187. Zenith Radio Corporation, Chicago, Ill. Filed Feb. 18, 1966.

TOUCH 'N SNOOZE

For Clock Radios.
First use at least as early as May 29, 1965.

Class 22—Games, Toys, and Sporting Goods

SN 215,247. Mile High Game & Toy Co., Inc., Denver, Colo. Filed Mar. 29, 1965.

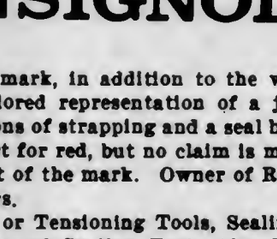
The drawing is lined for red, green, blue, and yellow, but color is not claimed as a feature of the mark.
For Equipment and Apparatus Sold as a Unit for Playing a Game of the Type Having Game Boards and Marbles and Other Game Members.
First use Jan. 1, 1962.

SN 220,346. American Model Car Raceways, Inc., Beverly Hills, Calif. Filed June 4, 1965.

No claim of an exclusive right is made to "Model Car Raceways" for the goods recited without waiver of any rights that common law in and to either the trade name or the composite mark as shown.
For Slot Racing Tracks.
First use July 29, 1964.

SN 228,090. Uneeda Doll Company, Inc., Brooklyn, N.Y. Filed Sept. 17, 1965.

SEE-MOR



For Dolls.
First use May 28, 1965.

SN 229,139. Shakespeare Company, Kalamazoo, Mich. Filed Oct. 1, 1965.

formula-Six

For Golf Balls.
First use Aug. 23, 1965.

SN 231,927. Old Pal, Inc., Lititz, Pa. Filed Nov. 1, 1965.
For Tackle Boxes.

First use Aug. 4, 1965.

SN 233,470. Dickson and Hannon, New York, N.Y. Filed Nov. 29, 1965.

SPHERE-O-METRICS

For Packaged Exercise Kit, Including a Rubber Ball and a Booklet Illustrating Exercises Employing Said Ball.
First use Nov. 17, 1965.

SN 233,918. S. S. Kresge Company, Detroit, Mich. Filed Dec. 3, 1965.

IO-Hi

For Bowling Balls.
First use on or before July 2, 1965.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

SN 211,202. Signode Corporation, Chicago, Ill. Filed Feb. 2, 1965.

SIGNODE

The composite mark, in addition to the word Signode, includes a solid colored representation of a joint uniting the overlapping portions of strapping and a seal blank. The drawing is lined in part for red, but no claim is made to a particular color as a part of the mark. Owner of Reg. Nos. 116,691, 586,568, and others.
For Stretching or Tensioning Tools, Sealing Tools, Combination Tensioning and Sealing Tools Also Known as Strapping Machines; Reels, Holders, and Coil Boxes for Package, Bundle, and Load Binding Strapping; Cutters for Strapping; Automatic and Semi-Automatic Machines for Binding Packages, Bundles, and the Like With Strapping; and Stapling Tools.
First use July 1, 1964.

SN 211,894. Ideal Industries, Inc., Sycamore, Ill. Filed Feb. 12, 1965.

DUAL BLADE

For Wire Strippers.
First use Jan. 31, 1964.

SN 214,165. H. K. Porter Company, Inc., Pittsburgh, Pa. Filed Mar. 15, 1965.

POLY CUT

For Knives for Paper-Cutting Machinery.
First use Jan. 29, 1965.

SN 214,519. Douglas Motors Corporation, Milwaukee, Wis. Filed Mar. 19, 1965.

ISAR

For Hydraulic Control Systems, Both Mechanically and Electrically Powered, as Used in Connection With Snow Plow Blades, Mobile Shop Equipment, Truck and Tractor Accessory Mountings, Material Handling Equipment; and Machine Tools, and Parts Thereof.
First use July 25, 1963.

SN 214,936. Walker Manufacturing Company, Racine, Wis. Filed Mar. 24, 1965.

POWER PIPE

The exclusive right to the word "Pipe" is disclaimed apart from the mark as shown.
For Exhaust System Parts—Namely, Mufflers, Tail Pipes, Exhaust Pipes, Tail Pipe Spouts, Exhaust Elbows, Extensions, Deflectors, Clamps, Brackets, Hangers, Bushings, Grommets, and Insulators; and Cold Chisels and Wrenches.
First use Feb. 18, 1965.

SN 217,901. Lawn Barber Corporation, Hollywood, Calif. Filed May 3, 1965.

For Gardening Implement—Namely, Powered Lawn Edgers and Trimmers.
First use 1953.

SN 218,943. American Monarch Machine Company, Inc., Peoria, Ill. Filed May 17, 1965.

AERO-MATIC

For Automatic Air Feed Device for Use on Any Press, Spot Welder, Drill Press, and the Like, in Feeding Stock Thereto.
First use July 2, 1964.

SN 219,748. Winona Tool & Manufacturing Company, Inc., Winona, Minn. Filed May 11, 1965.

WINONA

For Crankshaft Grinders and Accessories Therefor, Axle Bearing Fixtures, Hydraulic Presses, Hydraulic Jacks, Axle Pullers, Parts Cleaners and Accessories Therefor, Block Head Holders and Racks, Valve Seat Grinders, Valve Spring Compressors, Pin Fitters, and Gasoline Powered Air Car Starters.
First use Aug. 1, 1964.

SN 221,568. Borg-Warner Corporation, Chicago, Ill. Filed June 21, 1965.

DUO-DAMP

For Shaft Support Bearings for Automobile and General Machine Applications.
First use on or prior to May 17, 1965.

SN 224,931. Chemagnetics Controls, Inc., New York, N.Y., assignee of Chemagnetics Corporation, New York, N.Y. Filed Aug. 4, 1965.

CHLORO-GUARD

For Hypochlorination Equipment.
First use June 10, 1965.
Subj. to Intf. with SN 221,543.

SN 225,437. Pittsburgh Plate Glass Company, Pittsburgh, Pa. Filed Aug. 10, 1965.

pressseal

For Installation Kit and Components Therefor for the Replacement of Automobile Glass.
First use at least as early as Mar. 4, 1965.

SN 226,855. Murphy Diesel Company, Milwaukee, Wis. Filed Aug. 31, 1965.

LUGMASTER

For Engine Torque Controls for Earth Moving Equipment.
First use Aug. 18, 1965.

SN 227,855. Mail Systems Corporation, Redwood City, Calif. Filed Sept. 15, 1965.

POSTMASTER

For Machines for Sorting Mail by Weight.
First use May 21, 1965.

SN 228,359. Fuso Keigokin K.K., Itabushi-ku, Tokyo, Japan. Filed July 8, 1966.

ICEPET

Owner of Japanese Reg. Nos. 640,038 and 640,938, dated Apr. 2, 1964, and Apr. 13, 1964, respectively.
For Hand-Operated Ice Shaving Appliances.

SN 228,467. Lewis-Shepard Products, Inc., Watertown, Mass. Filed Sept. 23, 1965.

ORDERMASTER

Owner of Reg. Nos. 119,331, 725,916, and others.
For Materials Handling Equipment—Namely, Electric Fork Lift Trucks.
First use February 1965.

SN 228,578. Time-Mist, Inc., Stamford, Conn. Filed Sept. 24, 1965.

TIME-MIST

For Machines for Periodically Operating the Valve of an Aerosol Can.
First use May 27, 1965.

SN 230,458. Tyco Automotive Corp., Hicksville, N.Y. Filed Oct. 18, 1965.

TYCO

For Automotive Parts—Namely, Starter Drives, and Water Pumps.
First use Sept. 1, 1959.

SN 234,181. Cordem Corporation, Minneapolis, Minn. Filed Dec. 8, 1965.

GOLO

For Winches and Materials Lift.
First use March 1962.

SN 234,399. Dresser Industries, Inc., d.b.a. Pacific Pumps, Inc., Huntington Park, Calif. Filed Dec. 13, 1965.

DI-PAC

For Wear Parts and Components of Pumps—Namely, Shafts, Shaft Sleeves, Rings, and Impellers to Which a Hard Metal Facing Material Has Been Applied.
First use Nov. 4, 1965.

SN 234,537. Can-Tex Industries, Inc., d.b.a. Process Equipment Division, Mineral Wells, Tex. Filed Dec. 14, 1965.

TEX-A-ROBIC

For Sewage Treatment Plants.
First use Jan. 6, 1963.

SN 234,635. Eskimo Radiator Mfg. Co., Los Angeles, Calif. Filed Dec. 15, 1965.

MICRO FLUSH

For Pumping Apparatus for Cleaning Engine Cooling Systems.
First use Apr. 28, 1965.

SN 235,742. United Distributors Service, Inc., Roanoke, Va. Filed Jan. 3, 1966.

UDS

Owner of Reg. Nos. 768,348 and 772,186.
For Propeller Shaft Bearing Supports for Motor Vehicles.
First use Aug. 12, 1964.

SN 237,583. National Stamping & Electric Works, St. Louis, Mo. Filed Jan. 28, 1966.

WHITE CROSS

For Beverage Makers.
First use 1904.

SN 238,384. Appleton Machine Company, Appleton, Wis. Filed Feb. 9, 1966.

HI-SQUEEZ

For Absorbent Rollers and Embossing Rollers.
First use on or about Dec. 3, 1965.

SN 243,064. Worden-Allen Company, Milwaukee, Wis. Filed Apr. 11, 1966.

SANITAIRE

For Aerobic Sewage Treatment Plants.
First use June 22, 1964.

Class 24—Laundry Appliances and Machines

SN 225,398. Edward J. Budavich, d.b.a. E. J. Budavich Co., Carnegie, Pa. Filed Aug. 10, 1965.

For Laundry and Dry Cleaning Equipment—Namely, Clothes Washers, and Clothes Driers.
First use Mar. 30, 1965.

SN 233,930. The Maytag Company, Newton, Iowa. Filed Dec. 3, 1965.

WASHPOWER

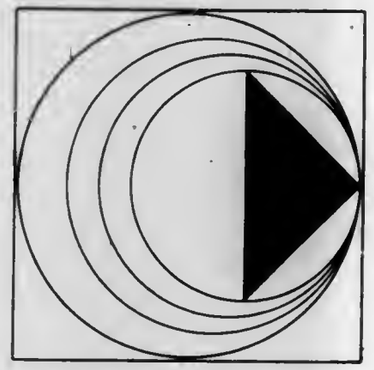
For Laundry Appliances—Namely, Automatic Washers and Wringer Washers.
First use Nov. 10, 1965.

Class 26—Measuring and Scientific Appliances

SN 221,467. Clark Metal Products, Inc., Bridgeport, Conn. Filed June 18, 1965.

For Control Monitoring Apparatus for Indicating the Malfunction of Machine Tools.
First use January 1963.

SN 221,774. Aerofeed Incorporated, Chalfont, Pa. Filed June 23, 1965.



For Air Pressure Operated Apparatus for Metering, Feeding and Dispensing Liquids and Chemical Solutions in Measured Quantities.
First use on or about May 20, 1965.

SN 225,565. Howe Richardson Scale Company, Clifton, N.J. Filed Aug. 12, 1965.

MECHANO-WEIGH

Owner of Reg. No. 613,093.
For Weighing Apparatus—Namely, Bench, Portable, and Counter Scales.
First use July 20, 1964.

SN 226,172. Speedring Corporation, Warren, Mich. Filed Aug. 20, 1965.

For Measuring and Scientific Appliances—Namely, Aerospace Gyro Compasses, Diameter Gages, Concentricity Gages, and Surface Gages.
First use June 30, 1965.

SN 235,713. Precision Scientific Company, Chicago, Ill. Filed Jan. 3, 1966.

PS ALLOY

No claim is made to the term "Alloy" apart from the mark as shown. Owner of Reg. Nos. 661,475 and 698,548.
For Laboratory Equipment—Namely, Clamps.
First use Oct. 5, 1965.

SN 246,157. C-F Equipment Co., Los Angeles, Calif. Filed May 20, 1966.

Pyrograph

For Temperature Indicators for Engine Exhaust.
First use on or about Jan. 25, 1966.

Class 27—Horological Instruments

SN 233,534. Sheffield Watch Inc., New York, N.Y. Filed Nov. 29, 1965.

SHERATON

For Watches and Clocks.
First use Oct. 7, 1965.

Class 29—Brooms, Brushes, and Dusters

SN 189,675. Agway, Inc., Syracuse, N.Y., by merger of Cooperative Grange League Federation Exchange, Inc., Ithaca, N.Y. Filed Mar. 26, 1964.

AGWAY

For House Brooms, Barn Brooms, Household Brushes, Dairy Brushes, and Stock Brushes.
First use Mar. 5, 1964.

Class 30—Crockery, Earthenware, and Porcelain

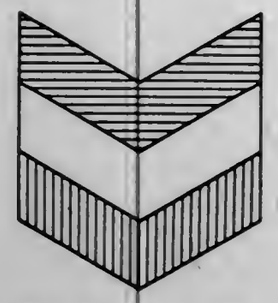
SN 226,919. International Artware Corporation, Cleveland, Ohio. Filed Sept. 1, 1965.

The drawing is lined for grey and gold.
For Pottery, Ceramics, Crockery, and Earthenware—Namely, Planters, Compotes, Vases, Cups and Saucers, Flower Holders, and Other Similar Decorative Items for Use in Conjunction With Floral Arrangements.
First use May 1961.

Class 31—Filters and Refrigerators

SN 189,676. Agway, Inc., Syracuse, N.Y., by merger of Cooperative Grange League Federation Exchange, Inc., Ithaca, N.Y. Filed Mar. 26, 1964.

AGWAY



For Water Softeners, Water Filters, Milk Filters, Freezers, Refrigerators, and Water Coolers.
First use Mar. 5, 1964.

SN 237,160. Sel-Rex Corporation, Nutley, N.J. Filed Jan. 24, 1966.

ORASORB

For Filtration and Purification Cartridges.
First use Nov. 10, 1965.

SN 238,457. Standard Oil Company of California, San Francisco, Calif. Filed Feb. 9, 1966.

The drawing is lined for red and blue. Applicant claims the colors red, white, and blue. Owner of Reg. No. 802,701 and others.
For Fuel Filters and Replacement Cartridges Therefor.
First use July 7, 1964.

Class 32 — Furniture and Upholstery

SN 233,268. The Leopold Company, Burlington, Iowa. Filed Nov. 24, 1965.

LEOPOLD

For Furniture—Namely, Chairs, Desks, Tables, Credenzas, Storage Cabinets, and File Cabinets.
First use not later than in or about 1900; not later than in or about 1891 in a different style.

Class 33 — Glassware

SN 196,919. Textron Electronics, Inc., d.b.a. Spectrolab, Sylmar, Calif. Filed July 1, 1964.

SOLAKOTE

For Coating or Filtering Media, Sold Applied to Glass, for Filtering Out Wave Lengths, and the Like.
First use on or before July 1, 1959.

Class 34 — Heating, Lighting, and Ventilating Apparatus

SN 210,533. Wehr Corporation, Milwaukee, Wis., assignee of Carnes Corporation, Verona, Wis. Filed Jan. 25, 1965.

CURTAINLINE

For Air Handling Equipment, Particularly Linear-Type Diffusers That Can Be Mounted Either in the Ceiling or Side Wall.
First use Dec. 11, 1964.

SN 219,054. Norcross Corporation, Newton, Mass. Filed May 17, 1965.

SIZEOMETER

For Cooking Apparatus for Preparation of Sizing and Components Thereof.
First use May 19, 1962.

SN 221,666. Westinghouse Electric Corporation, Buffalo, N.Y. Filed June 21, 1965.

GOLDEN 21

For Welding Consumable Wire.
First use on or about Apr. 3, 1964.

SN 224,618. Hy-Way Heat Systems, Inc., Youngstown, Ohio. Filed July 30, 1965.

HY-WAY HOT OIL HEATER

The drawing is lined for red, but color is not claimed as a feature of the mark. No claim is made to the word "Heater" apart from the mark as shown, applicant's common law rights however, being reserved. Owner of Reg. No. 628,705.
For Apparatus for Heating Oil, Storing, Circulating, and Transferring Oil.
First use June 5, 1948.

SN 226,294. Schaub Engineering Co., Downers Grove, Ill. Filed Aug. 23, 1965.

For Deaerators, Boiler Feedwater Heaters, Steam Heat Reclaim Systems, Condensate Systems, Hot Water Heating Systems, and Boiler Blowdown Systems.
First use Mar. 29, 1965.

SN 232,246. Standard Oil Company of California, San Francisco, Calif. Filed Nov. 5, 1965.

The drawing is lined for red and blue. Applicant claims the colors red, white, and blue.
For Burners for Oil-Fired Furnaces.
First use Apr. 7, 1965.

SN 233,365. L. Richard Luedeman, d.b.a. Therm-O-Attix, Marysville, Calif. Filed Nov. 26, 1965.

THERM-O-ATTIX

For Ventilation Fans.
First use June 30, 1965.

SN 238,151. Armstrong Cork Company, Lancaster, Pa. Filed Feb. 7, 1966.

GRIDMATE

For Lighting Fixtures.
First use Dec. 28, 1965.

SN 238,829. Babcock-Wilcox and Goldie-McCulloch Limited, Galt, Ontario, Canada. Filed Feb. 15, 1966.

STEAMBLOC

REGISTRATIONS PUBLISHED UNDER SEC. 12(c)

The following marks registered under the act of 1905, or the act of 1881, are published under the provisions of section 12(c) of the Trademark Act of 1946. These registrations are not subject to opposition but are subject to cancellation under section 14 of the act of 1946.

Class 1—Raw or Partly Prepared Materials

54,454. June 26, 1906. The United States Graphite Company, Saginaw, Mich. Pub. by The Wickes Corporation, Saginaw, Mich.

205

For Pulverized Graphite.

Class 4—Abrasives and Polishing Materials

385,469. Mar. 4, 1941. Midwest Manufacturing Company, Detroit, Mich. Pub. by Samuel H. Klee, d.b.a. Midwest Manufacturing Co., Detroit, Mich.

ENDURO

For Floor Wax, Scratch Remover Preparation for Furniture, Furniture Cream Polish, Car Polish, and a Wax Polishing and Cleaning Preparation for Automobiles and the Like.

Class 12—Construction Materials

54,476. June 26, 1906. Pacific Portland Cement Co., San Francisco, Calif. Pub. by Ideal Cement Company, Denver, Colo.

For Portland Cement.

212,075. Apr. 27, 1926. The Marbleloid Company, New York, N.Y., Pub. by The Marbleloid Corp., North Bergen, N.J.

MARBLELOID

For Construction Materials—Namely, Plastic and Tile Flooring, Art Tile, Wainscoting, etc.

215,981. Aug. 3, 1926. Western Waterproofing Company, Inc., Boston, Mass. Pub. by registrant.

WESTERN'S DAMPPROOFING

For Asphalt Preparation for Rendering Walls and Other Surfaces Proof Against the Passage of Moisture Therethrough.

220,447. Nov. 9, 1926. Carolina Refractories Company, Hartsville, S.C. Pub. by registrant.

CARECO ONE-PIECE FURNACE LINING

For Furnace Linings, etc.

Class 14—Metals and Metal Castings and Forgings

421,303. May 28, 1946. The Lennox Foundry Company Limited, Kent, England. Pub. by registrant.

TANTIRON

For Unwrought and Partly Wrought Nonferrous Metal, etc.

Class 15—Oils and Greases

54,647. June 26, 1906. The United States Graphite Company, Saginaw, Mich. Pub. by The Wickes Corporation, Saginaw, Mich.

MEXICAN

For Plumbago Axle Grease.

55,468. Aug. 14, 1906. The United States Graphite Company, Saginaw, Mich. Pub. by The Wickes Corporation, Saginaw, Mich.

GRAFITA

For Lubricating Graphite.

422,080. July 2, 1946. E. I. du Pont de Nemours and Company, Wilmington, Del. Pub. by registrant.

DUPONT

For Penetrating, Lubricating Composition Containing a Mixture of a Vegetable Oil and a Solvent Therefor.

Class 16—Protective and Decorative Coatings

213,806. June 8, 1926. E. I. du Pont de Nemours and Company, Wilmington, Del. Pub. by registrant.

PYRALIN

For Proxylin Enamels.

Class 17—Tobacco Products

420,894. May 7, 1946. Lane Tobacco, Ltd., New York, N.Y. Pub. by Lane Limited, New York, N.Y.

ECONOMY

For Smoking Tobacco.

Class 18—Medicines and Pharmaceutical Preparations

212,878. May 18, 1926. J. C. Eno, Limited, London, England. Pub. by Beecham Products Inc., Clifton, N.J.

For Medicinal Saline Preparation for Human Use.

Class 21—Electrical Apparatus, Machines, and Supplies

422,755. Aug. 13, 1946. Duro-Test Corporation, North Bergen, N.J. Pub. by registrant.

For Incandescent and Fluorescent Lamps.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

56,563. Oct. 9, 1906. Norman Mellor, Philadelphia, Pa. Pub. by Arguto Oilless Bearing Company, Philadelphia, Pa.

Arguto

For Machine-Bearings.

57,124. Nov. 6, 1906. National Needle Co., Springfield, Mass. Pub. by The Torrington Company, Torrington, Conn.

STANDARD

For Sewing-Machine Needles.

Class 25—Locks and Safes

216,950. Aug. 24, 1926. The Mosler Lock Company, Covington, Ky. Pub. by The Mosler Safe Company, Hamilton, Ohio.

5700

For Locks, Particularly Locks for Safe Deposit Boxes.

Class 26—Measuring and Scientific Appliances

421,476. June 4, 1946. Wm. Ainsworth & Sons, Inc., Denver, Colo. Pub. by registrant.

D.W. BRUNTON'S

For Pocket Transits.

421,734. June 18, 1946. Ernest J. Abbott, d.b.a. Physicists Research Company (Not Inc.), Ann Arbor, Mich. Pub. by The Bendix Corporation, Detroit, Mich.

ANDEROMETER

For Apparatus for Testing Rotatable Bearings, and Parts Thereof.

423,472. Sept. 3, 1946. Wm. Ainsworth & Sons, Inc., Denver, Colo. Pub. by registrant.

BRUNTON

For Pocket Transits.

Class 27—Horological Instruments

421,181. May 21, 1946. Waltham Watch Company, Chicago, Ill. Pub. by registrant.

For Watches.

Class 35—Belting, Hose, Machinery Packing, and Nonmetallic Tires

54,550. June 26, 1906. Gorham Rubber Company, San Francisco, Calif. Pub. by United States Rubber Company, New York, N.Y.

AMAZON

For Rubber Hose.

57,005. Oct. 30, 1906. Revere Rubber Company, Boston, Mass. Pub. by United States Rubber Company, New York, N.Y.

SECURITY

For Belting, Hose, and Machinery Packings.

Class 37—Paper and Stationery

215,318. July 13, 1926. The Northwest Paper Company, Cloquet, Minn. Pub. by registrant.

NORTHWEST

For Book Paper, etc.

Class 38—Prints and Publications

214,260. June 15, 1926. C. R. Moen, La Crosse, Wis. Pub. by Moen Photo Service, Incorporated, La Crosse, Wis.

ENAMEL MOEN-TONE PRINTS

For Photoprints.

Class 39—Clothing

212,132. Apr. 27, 1926. The Mallory Hat Company, Danbury, Conn. Pub. by John B. Stetson Company, Philadelphia, Pa.

MALLORY

For Hats for Men, Women, and Children.

Class 43—Thread and Yarn

265,952. Jan. 7, 1930. S. S. Kresge Company, Detroit, Mich. Pub. by registrant.

GREEN OAK

For Thread.

265,953. Jan. 7, 1930. S. S. Kresge Company, Detroit, Mich. Pub. by registrant.

GREEN OAK

For Thread.

Class 44 — Dental, Medical, and Surgical Appliances

53,258. May 29, 1906. The S. S. White Dental Mfg. Co., Philadelphia, Pa. Pub. by S. S. White Company, Philadelphia, Pa.

CROWN

For Wax.

53,360. May 29, 1906. The S. S. White Dental Mfg. Co., Philadelphia, Pa. Pub. by S. S. White Company, Philadelphia, Pa.

SUMP

For Investment and Impression Compounds.

53,361. May 29, 1906. The S. S. White Dental Mfg. Co., Philadelphia, Pa. Pub. by S. S. White Company, Philadelphia, Pa.

CAVITINE

For Cavity-Linings.

Class 46 — Foods and Ingredients of Foods

57,618. Nov. 13, 1906. Whipple Co-Operative Company, Natick, Mass. Pub. by The Whipple Company, Natick, Mass.

Grandmother's

For Mince Meat.

Class 47 — Wines

305,648. Aug. 22, 1933. Virginia Dare Extract Co., Inc., Brooklyn, N.Y. Pub. by registrant.

For Wines.

Class 49 — Distilled Alcoholic Liquors

418,812. Jan. 8, 1946. Ron Zorro Distillers, St. Thomas, Virgin Islands. Pub. by West Indies Distillers, Ltd., St. Amalie, Virgin Islands.

Carousel

For Rum.

Class 51 — Cosmetics and Toilet Preparations

422,330. July 16, 1946. Socialite Cosmetics, Inc., New York, N.Y. Pub. by Arthur Matney, Brooklyn, N.Y.

United States Adopted Names

List No. 14

March 1, 1966 to June 30, 1966

The following nonproprietary names for the drugs described have been adopted by the USAN Council (the nomenclature committee sponsored by the American Medical Association, the American Pharmaceutical Association, and the United States Pharmacopeia) in cooperation with the interested manufacturers. The designation "United States Adopted Names" (U.S.A.N.) has been coined to distinguish these formally adopted nonproprietary names from other nonproprietary names. Adoption of such names does not imply endorsement of the products involved by the A.M.A. Council on Drugs, the USP, or the National Formulary.

Any comments or suggestions should be addressed to Doctor Joseph B. Jerome, Assistant Director, Council on Drugs, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

allobarbital: central nervous system depressant
betamethasone acetate: corticosteroid
betamethasone disodium phosphate: corticosteroid
cloperidone hydrochloride: sedative; tranquilizer
descinolone acetonide: glucocorticoid
gamfexine: antidepressant
guanethidine monosulfate: hypotensive
hycanthone: schistosomacide
isosorbide: oral osmotic diuretic
lidoflazine: cardiovascular agent
mesterolone: oral androgenic hormone
metyrapone tartrate: diagnostic test of pituitary function
niclosamide: anthelmintic
nitarsone: veterinary histomonastat
nonoxynol: spermatocide
prednival: topical anti-inflammatory
prilocaine hydrochloride: local anesthetic
propiram fumarate: analgesic
pyrantel tartrate: anthelmintic
rifamide: antibacterial
roxarsone: veterinary growth stimulant
sodium ampicillin: antibiotic
sodium edetate: chelating agent
tetroquinone: treatment of keloids
trimoxamine hydrochloride: antihypertensive
trisodium edetate: chelating agent
viridofulvin: antifungal antibiotic

United States Adopted Names (USAN) and United States Adopted Names (Proposed) (USAN)

QUARTERLY CUMULATIVE LIST

January 1, 1966–June 30, 1966

This is a revised alphabetical listing of the nonproprietary names *proposed for adoption* by the USAN Council which were published in the Trademark Bureau Bulletin during the period indicated. The listing also incorporates the revised lists of *adopted* nonproprietary names issued by the USAN Council, but not published in the Bulletin.

The Quarterly Cumulative List is intended to supplement USAN Cumulative List 4, 1961–1965, published annually for the Council by the United States Pharmacopeia; it is distributed with an issue of the Trademark Bureau Bulletin.

An asterisk (*) before a name indicates an *adopted name*; all other names on the list are *proposed for adoption*.

Since Q.C.L. is cumulative, only the latest issue need be consulted. All preceding lists may be discarded.

Any comments or protests regarding proposed names should be brought promptly to the attention of the USAN Council, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

*allobarbital: central nervous system depressant
asperlin: antibacterial; antineoplastic
*betamethasone acetate: corticosteroid
*betamethasone disodium phosphate: corticosteroid
*cloperidone hydrochloride: sedative; tranquilizer
*cyheptamide: anticonvulsant
*descinolone acetonide: glucocorticoid
*gamfexine: antidepressant
*guanethidine monosulfate: hypotensive
*hycanthone: schistosomacide
*ibufenac: analgesic; anti-inflammatory
*isosorbide: oral osmotic diuretic
*lidoflazine: cardiovascular agent
*mefruside: diuretic
*mesterolone: oral androgenic hormone
*metyrapone tartrate: diagnostic test of pituitary function
*niclosamide: anthelmintic
*nifuraldezone: antibacterial
*nitarsone: veterinary histomonastat
*nitrazepam: hypnotic; anticonvulsant
*nitromide: veterinary coccidiostat and antibacterial
*nonoxynol: spermatocide
*norgestrel: progestin
*pemoline: central nervous system stimulant
phenobarb: proposed abbreviation for phenobarbital
phthalofyne: veterinary anthelmintic

New Applications Received During July 1966

Patents	6925
Designs	380
Plant Patents	2
Reissues	14
Total	7321

Issue—September 13, 1966

Patents	1,384	No. 3,271,778 to No. 3,273,161, incl.
Designs	48	No. 205,702 to No. 205,749, incl.
Plant Pats.	1	No. 2,671
Total	1,433	

•prednival : topical anti-inflammatory
•prilocaine hydrochloride : local anesthetic
•propiram fumarate : analgesic
•pyrantel tartrate : anthelmintic
quilasine maleate : oxytocic
•rifamide : antibacterial
•roxarsone : veterinary growth simulant
seperidol hydrochloride : neuroleptic
•sodium ampicillin : antibiotic
•sodium edetate : chelating agent
•sodium ethacrynate : diuretic
sulfabens : veterinary antibacterial and anticoccidial
sulfafen : antibacterial ; anticoccidial agent
•tetramisole hydrochloride : anthelmintic
•tetroquinone : treatment of keloids
thyroglobulin : thyroid preparation
•trimoxamine hydrochloride : antihypertensive
•trisodium edetate : chelating agent
•viridofulvin : antifungal antibiotic
zolertine hydrochloride : vasodilator ; anti-adrenergic ; anti-hypertensive

Second Action Rejection

Effective Sept. 1, 1966, on a trial basis until further notice, second actions on the merits will not be made final where the Examiner introduces new art or a new ground of rejection not necessitated by an amendment or change in the claims or specification. Also, a shortened statutory period of three months will be set in such actions. The third action should then be made final and include a three-month shortened statutory period. Thus, no shortened statutory period in excess of three months will be set in any action.

RICHARD A. WAHL,
Assistant Commissioner

Discontinuation of a Service by Mail Room

Effective Sept. 1, 1966, the privilege that has been extended to applicants and their representatives with respect to personal service in the Mail Room will be modified. Amendments and other papers may continue to be hand delivered to the Mail Room where they will be dated and then processed in the normal manner. However, in the interest of Office efficiency, the special privilege of having these documents returned to the applicant or his representative for the purpose of hand delivery to other Branches or Examining Groups will be discontinued. If it is considered necessary to discuss the subject matter of any document that has been officially deposited in the Mail Room, it would be appropriate to use a copy of the document for that purpose.

EDWARD J. BRENNER,
Aug. 8, 1966. *Commissioner.*

Notification Re Conflict in Assignment in Certain Applications

Effective September 12, 1966, Assignment Branch will discontinue mailing notification in cases where there is a conflict in assignment between an original application and its divisional, continuation, substitute, or continuation-in-part application.

Assignments from original applications are applied without charge ONLY to divisional, continuation, or substitute applications where the date of the assignment is prior to the filing date of the later-filed application. (Continuation-in-part applications require separate assignments if they are to be issued to the assignee.)

Practitioners are reminded of the provisions of Rule 334. Unless an assignment is filed at or prior to the date of payment of the issue fee, the patent will normally be issued in the name of the inventor.

Section 306 of the Manual of Patent Examining Procedures will be amended appropriately.

W. R. ARMSTRONG,
Director, Office of Patent Services.

Concurred :
(Signed) R. A. WAHL,
Assistant Commissioner.

Dedications

2,775,945.—*Armais Arutunoff*, Bartlesville, Okla. SAND RESISTANT PUMP. Patent dated Jan. 1, 1957. Dedication filed June 23, 1966, by the assignee, *Byron Jackson Pumps, Inc.*

Hereby dedicates to the Public the remaining term of said patent.

2,783,400.—*Armais Arutunoff*, Bartlesville, Okla. PROTECTING UNIT FOR OIL-FILLED SUBMERGIBLE ELECTRIC MOTORS. Patent dated Feb. 26, 1957. Dedication filed June 23, 1966, by the assignee, *Byron Jackson Pumps, Inc.*

Hereby dedicates to the Public the remaining term of said patent.

2,920,203.—*Joseph L. Switzer*, Gates Mills, Ohio, and *Donald W. Parker, Jr.*, Park Ridge, Ill. FLUORESCENT PENETRANT INSPECTION MATERIALS AND METHODS. Patent dated Jan. 5, 1960. Dedication filed June 27, 1966, by the assignee, *Switzer Brothers, Inc.*

Hereby dedicates to the Public the terminal portion of said patent.

Disclaimers

Des. 198,185.—*Arthur R. Bentsen*, Liverpool, N.Y. PHONOGRAPH OR SIMILAR ARTICLE. Patent dated May 12, 1964. Disclaimer filed June 1, 1966, by the assignee, *General Electric Company.*

Hereby enters this disclaimer to the claim of said patent.

2,670,145.—*John M. Biddison*, Dayton, Ohio. ARMATURE WINDING MACHINE. Patent dated Feb. 23, 1954. Disclaimer filed June 3, 1966, by the assignee *Harry W. Moore.*

Hereby enters this disclaimer to claims 1, 2, 3, 4, 14, 19 and 20 of said patent.

2,996,704.—*Thomas L. Dimond*, Rutherford, and *Harold M. Pruden*, Maplewood, N.J., and *Calvin O. Vogt*, Augusta, Ga. METHOD OF AND APPARATUS FOR GENERATING CODED SIGNALS. Patent dated Aug. 15, 1961. Disclaimer filed June 30, 1966, by the assignee, *Bell Telephone Laboratories, Incorporated.*

Hereby enters this disclaimer to claims 1, 2, 3, 5 and 6 of said patent.

3,086,242.—*Paul M. Cook*, Atherton, and *Richard W. Muchmore*, Redwood City, Calif. PROCESS AND APPARATUS FOR PRODUCING MATERIALS HAVING PLASTIC MEMORY. Patent dated Apr. 23, 1963. Disclaimer filed June 24, 1966, by the assignee, *Raychem Corporation.*

Hereby enters this disclaimer to claims 11 and 12 of said patent.

3,130,430.—*Jacob S. Kamborian*, West Newton, Mass. METHOD OF LASTING A SHOE. Patent dated Apr. 28, 1964. Disclaimer filed June 17, 1966, by the inventor.

Hereby enters this disclaimer to claims 1, 2, 3, 5 and 6 of said patent.

3,140,523.—*Raymond G. Taylor, Jr.*, Santa Monica, Calif. SLIP ELEVATORS. Patent dated July 14, 1964. Disclaimer filed June 9, 1966, by the assignee, *Byron Jackson Inc.*

Hereby enters this disclaimer to claims 1 through 18 of said patent.

3,144,387.—*Eldon M. Jones*, Ann Arbor, Mich. ANTI-INFLAMMATORY COMPOSITIONS. Patent dated Aug. 11, 1964. Disclaimer filed June 2, 1966, by the assignee, *Parke, Davis & Company.*

Hereby enters this disclaimer to claims 1, 2 and 5 of said patent.

3,167,314.—*Arthur R. Bentsen*, Liverpool, N.Y. PORTABLE PHONOGRAPH. Patent dated Jan. 26, 1965. Disclaimer filed June 1, 1966, by the assignee, *General Electric Company.*

Hereby enters this disclaimer to claims 1–7 of said patent.

3,188,533.—*Jork Bretting*, Ulm (Danube), and *Hans-Jurgen Griem*, Ehrenstein, Germany. FOCUSSING SYSTEM FOR AN ELECTRON BEAM INCORPORATING AXIALLY MAGNETIZED ANNULAR MAGNETS. Patent dated June 8, 1965. Disclaimer filed May 6, 1966, by the *assignee, Telefunken Patentverwertungs G.m.b.H.*

Hereby enters this disclaimer to claim 11 of said patent.

3,209,098.—*Henry S. Wingard*, Cranford, N.J. CIRCUIT BREAKERS HAVING IMPROVED TRIPPING MECHANISMS. Patent dated Sept. 28, 1965. Disclaimer filed June 30, 1966, by the assignee, *Federal Pacific Electric Company.*

Hereby enters this disclaimer to claims 10, 11 and 13 of said patent.

3,241,701.—*Le Roy R. Boggs*, Bristol, Tenn. SECTIONAL TANK. Patent dated Mar. 22, 1966. Disclaimer filed June 3, 1966, by the assignee *Universal Moulded Fiber Glass Corp.*

Hereby enters this disclaimer to claims 7, 8, 9 and 10 of said patent.

Classification Order No. 383

Classification Order No. 383, dated August 11, 1966, incorporates changes in the following classes :

179, TELEPHONY
200, ELECTRICITY, CIRCUIT MAKERS AND BREAKERS
312, SUPPORTS, CABINET STRUCTURES
317, ELECTRICITY
335, ELECTRICITY, MAGNETICALLY OPERATED SWITCHES, MAGNETS AND ELECTROMAGNETS—Established (Bulletin No. 471)

All of the above changes will be incorporated in the Manual of Classification replacement pages dated October 1966.

G. A. GORECKI,
Director, Office of Patent Classification.

Reorganization of Examining Corps

As a result of a recent reorganization of the Examining Corps several Groups have been dissolved and merged with one or more other Groups and/or given new designations. One isolated case of an Art Unit transfer was that of 351 which was transferred to Group 320. Please note the following Group changes and address mail accordingly.

Group 130—Dissolved ; 2 art units to 110 ; 2 art units to 120.
150—Dissolved ; 3 art units to 140 ; 1 art unit to 160.
180—Merged with 170.
Group 240—Merged with 230.
260—Merged with 250.
270—Merged with 210.
Group 370—Redesignated as 340.
Group 410—Redesignated as 330.
420—Merged with 350.
430—Redesignated as 280.
440—Merged with 360.
450—Merged with 310.
460—Dissolved ; 2 art units to 310 ; 2 art units to 350.
470—Dissolved ; 2 art units to 360 ; 2 art units to 330.
490—Redesignated as 290.

With respect to the various classes assigned to specific Art Units within the Groups, this information will be reflected in the index pages of the forthcoming October revision to the Manual of Classification.

Correspondence originating within the Office is now indicating the Art Unit number (i.e., 113) rather than just the Group (i.e., 110) ; please use this in return correspondence as it will facilitate mail service within the Office.

All correspondence addressed to the Patent Office should include the ZIP Code numbers of both the addressor and the Patent Office (20231).

RICHARD A. WAHL,
Aug. 23, 1966. *Assistant Commissioner.*

PATENT EXAMINING CORPS

R. A. WAHL, Assistant Commissioner

CONDITION OF PATENT APPLICATIONS AS OF JULY 1, 1966

PATENT EXAMINING OPERATIONS AND GROUPS	Actual Filing Date of Oldest Case Awaiting Action: New	Amended
CHEMICAL EXAMINING OPERATION—I. MARCUS, Director.		
GENERAL CHEMISTRY, GROUP 110—R. L. CAMPBELL, Manager. Inorganic Compounds; Inorganic Compositions; Organo-Metal and Organo-Metalloid Chemistry; Metallurgy; Metal Stock; Electro Chemistry; Batteries.	7-1-63	11-14-62
GENERAL ORGANIC CHEMISTRY, GROUP 120—G. D. MITCHELL, Manager. Heterocyclic; Amides; Alkaloids; Azo; Sulfur; Misc. Esters; Carbohydrates; Herbicides; Poisons; Medicines; Cosmetics; Steroids.	1-29-63	2-20-61
PETROLEUM CHEMISTRY, GROUP 130—J. R. LIBERMAN, Manager. Hydrocarbons; Halogenated Hydrocarbons; Mineral Oil Technology; Lubricating Compositions; Gaseous Compositions; Fuel and Igniting Devices; Organic Chemistry (Part) e.g.: Oxo and Oxy; Quinones; Acids; Carboxylic Acid Esters; Acid Anhydrides; Acid Halides.	7-1-63	4-13-62
HIGH POLYMER CHEMISTRY, GROUP 140—M. STERMAN, Manager. Synthetic Resins; Rubber; Proteins; Macromolecular Carbohydrates; Mixed Synthetic Resin Compositions; Synthetic Resins With Natural Polymers and Resins; Natural Resins: Reclaiming; Pore-Forming.	7-1-63	7-11-60
COMPOSITIONS AND MOLDING, GROUP 150—M. STERMAN, Manager. Compositions (Part) e.g.: Coating; Molding; Adhesive Compositions; Abrading; Liquid Purification or Separation; Gas Separation; Special Utility; Molding Processes.	7-23-63	2-26-60
COATING AND LAMINATING, GROUP 160—J. R. LIBERMAN, Manager. Coating: Processes, Apparatus and Misc. Products; Laminating Methods and Apparatus; Stock Materials; Ornamentation; Adhesive Bonding; Special Manufactures.	6-4-63	12-4-61
SPECIALIZED CHEMICAL ARTS AND INDUSTRIES, GROUP 170—W. B. KNIGHT, Manager. Bleaching and Dyeing; Fertilizers; Foods; Fermentation; Photography; Analytical Chemistry; Reactors; Sugar and Starch; Paper Making; Glass Manufacture; Metallurgical Apparatus; Gas, Heating and Illuminating; Cleaning Processes; Liquid Purification; Thermolytic Distillation; Preserving.	11-16-62	10-11-61
CHEMICAL ENGINEERING, GROUP 180—G. D. MITCHELL, Manager. Gas, Liquid and Solid Separation; Gas and Liquid Contact Apparatus; Distillation; Refrigeration; Concentrative Evaporators; Mineral Oils Apparatus; Misc. Physical Processes.	1-11-63	12-18-62
ELECTRICAL EXAMINING OPERATION—N. H. EVANS, Director.		
POWER AND ELEMENTS, GROUP 210—M. L. LEVY, Manager. Generation and Utilization; General Applications; Conversion and Distribution; Heating and Related Art Conductors; Switches; Miscellaneous.	12-31-62	10-19-61
SECURITY, GROUP 220—S. BOYD, Manager. Ordnance, Firearms and Ammunition; Radar, Underwater Signalling, Directional Radio, Torpedos, Seismic Exploring, Radio-Active Batteries; Nuclear Reactors, Powder Metallurgy, Rocket Fuels; Radio-Active Material.	8-26-63	1-16-62
INFORMATION TRANSMISSION, GROUP 230—E. J. SAX, Manager. Communications; Multiplexing Techniques; Facsimile and Related Art.	4-4-63	12-22-61
INFORMATION STORAGE AND RETRIEVAL, GROUP 240—E. J. SAX, Manager. Data Processing, Computation and Conversion; Storage Devices and Related Art.	12-28-62	2-6-61
ELECTRONIC COMPONENT SYSTEMS AND DEVICES, GROUP 250—F. M. STRADER, Manager. Semi-Conductor and Space Discharge Systems and Devices; Electronic Component Circuits; Wave Transmission Lines and Networks.	12-17-62	7-31-61
RADIATION AND INSTRUMENTS, GROUP 260—F. M. STRADER, Manager. Optics; Radiant Energy; Measuring.	1-8-63	8-8-61
PHYSICS, GROUP 280—R. L. EVANS, Manager. Photography; Sound and Lighting; Indicators and Optics; Measuring and Testing; Geometrical Instruments.	9-18-63	10-25-62
DESIGNS, GROUP 290—S. BOYD, Manager. Industrial Arts; Household, Personal and Fine Arts.	5-17-65	9-21-64

Total number of pending applications (excluding Designs)	196,314
Total number of Design applications pending	4,534
Total number of applications awaiting action (excluding Designs)	145,101
Total number of Design applications awaiting action	2,563

Date of oldest amended application awaiting action	Feb. 26, 1960

EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during August 1966, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1965*.

Patents	Numbers 2,477,558 to 2,490,820, inclusive
Plant Patents	Numbers 858 to 869, inclusive

PATENT EXAMINING OPERATIONS AND GROUPS (Continued)	Actual Filing Date of Oldest Case Awaiting Action	
	New	Amended
MECHANICAL EXAMINING OPERATION—F. H. BRONAUGH, Director.		
MATERIAL HANDLING, GROUP 310—A. BERLIN, Manager Material or Article Handling and Dispensing; Conveyors; Hoists; Elevators; Article Handling Implements; Store Service; Sheet and Web Feeding; Fluid Sprinkling and Fire Extinguishers; Coin Handling and Check Controlled Apparatus; Classifying and Assorting Solids.	10-5-64	2-19-64
MANUFACTURING; METAL, PLASTICS WORKING; MACHINE TOOLS, GROUP 320—N. BERGER, Manager Manufacturing Processes, Assembling, Combined Machines, Special Article Making; Metal Deforming; Sheet Metal and Wire Working; Metal Fusion—Bonding, Metal Founding; Metallurgical Apparatus; Plastics Working Apparatus; Plastic Block and Earthenware Apparatus; Machine Tools for Shaping or Dividing; Work and Tool Holders.	3-3-64	3-6-62
TOOLS, JOINTS, AND HARDWARE, GROUP 350—T. J. HICKEY, Manager Miscellaneous Hardware; Tools; Joints; Cutlery; Locks; Fasteners; Rod Pipe and Electrical Connectors; Buckles; Buttons, Clasps, Etc.; Pushing and Pulling.	7-7-64	4-30-63
FLUID HANDLING, GROUP 360—T. J. HICKEY, Manager Fluid Handling; Valves, Pipes and Tubular Conduits; Fluent Material Handling; Lubrication; Baths, Closets and Sinks; Joint Packing; Centrifugal Bowl Separators.	5-18-64	11-7-62
HEAT AND POWER ENGINEERING, GROUP 370—C. F. GAREAU, Manager Power Plants; Combustion Engines; Fluid Motors; Pumps; Turbines; Heat Generation and Exchange; Refrigeration, Ventilation; Drying; Vaporizing; Temperature and Humidity Regulation; Machine Elements; Power Transmission.	8-17-64	11-14-63
AMUSEMENT, HUSBANDRY AND PERSONAL TREATMENT, GROUP 410—A. RUEGG, Manager Amusement and Exercising Devices; Projectors; Animal and Plant Husbandry; Butchering; Earth Working and Excavating; Fishing, Etc.; Tobacco; Artificial Body Members; Dentistry; Jewelry; Surgery and Toiletry.	10-14-63	1-3-62

DECISIONS IN PATENT AND TRADEMARK CASES

U.S. Court of Customs and Patent Appeals

IN RE ANDRE FOURNET, RENE VICTOR JULIEN ACHARD AND PIERRE LAFONT

No. 7587. Decided March 17, 1966

[53 CCPA—; 357 F.2d 392; 148 USPQ 740]

1. APPEAL TO U.S. COURT OF CUSTOMS AND PATENT APPEALS—MATTER BEFORE COURT—CLAIMS TREATED TOGETHER.

"The appealed claims were considered together before the Board and in the briefs before us; hence we will treat them likewise."

2. PATENTABILITY—OBVIOUSNESS—TEACHINGS OF ALL REFERENCES WEIGHED AS A WHOLE.

"Appellants have not come forward with any showing which would suggest that the claimed process would not have been obvious to one of ordinary skill in this art. In the final analysis, the person of ordinary skill in the art is required to evaluate and weigh the teachings of all the references as a whole. The general teachings of references relied on by appellants are not such that one of ordinary skill in the art would consider the claimed process to be unobvious."

3. SAME—SAME—FACTUAL GAP BETWEEN CLAIMED SUBJECT MATTER AND PRIOR ART.

"In Mills we rejected any doctrine of 'legal presumption of obviousness.' In analyzing the deficiencies of the prior art teachings relied on as establishing the composition claimed as obvious we stated: 'On the record before us, to reach the conclusion reached by the Board, we are required in some way to bridge the factual gap between the Lewis disclosure of the C_8 to C_{12} alkyl sulfates and applicant's claim for use of the C_1 alkyl sulfate with respect to a specific property, i.e., the inhibiting of caking in a detergent composition containing an alkyl aryl sulfonate detergent. The Board and the Examiner have substituted what the Board terms a "legal presumption" for factual data, which is missing from the record, and without which a proper decision as to obviousness cannot be made.' We think the factual gap found in the prior art teachings in Mills has been filled here. The references in support of the rejection [of claims to a process of oxidizing cyclododecane] teach analogous processes employing specific reactants having 7 or 8 carbon atoms in the ring and also disclose generally that reactants possessing 4 to 20 carbon atoms in the molecule may be employed. The principles in Mills are applicable here and the art of record conforms to those principles."

4. SAME—SAME—TEACHINGS OF ALL REFERENCES EVALUATED AS A WHOLE—REFERENCES CONSIDERED REGARDLSS BY WHOM OFFERED—35 U.S.C. 103.

"* * * we regard the use of prior art teachings under 35 U.S.C. 103 as a two-way street, available to both parties. We are required to evaluate the reference *as a whole* regardless of the party offering the references. In *Lunsford*, we refused to ignore specific teachings which we believed would be given greater weight than general teachings by one of ordinary skill in the art. We evaluated the references against the invention as a whole as required by 35 U.S.C. 103 and gave effect to the uncontraverted specific teachings which were contrary to the position of the Patent Office. Here, we think that the specific teachings offered by the Patent Office show the obviousness of the claimed process to the satisfaction of one of ordinary skill in the art."

5. SAME—PARTICULAR SUBJECT MATTER—PROCESS FOR OXIDIZING CYCLODODECANE.

The refusal of certain claims in an application to a process for oxidizing cyclododecane, as unpatentable over the prior art, is affirmed.

APPEAL from the Patent Office. Serial No. 44,836.

AFFIRMED.

Donald G. Welsh for appellants.

Clarence W. Moore (*Jack E. Armore* of counsel) for the Commissioner of Patents.

Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, JR., *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK, *United States Senior District Judge for the Eastern District of Pennsylvania*

SMITH, *J.*, delivered the opinion of the court.

The issue here is whether the invention defined in the seven appealed claims,[1] a chemical process, is obvious within the meaning of 35 U.S.C. 103.

The appealed claims define a process for the production of cyclododecanone and cyclododecanol. The broadest claim on appeal, claim 1, defines a process "which comprises oxidizing cyclododecane in the liquid phase with molecular oxygen at a temperature of 90°–150° C."

[1] The appealed claims were considered together before the Board and in the briefs before us; hence we will treat them likewise.

The prior art references relied on as a basis for the rejection are as follows:

Moell et al. [Moell], 2,927,135, March 1, 1960.

Badische Anilin et al. [France], 1,070,846, February 24, 1954.

Dougherty et al. [Dougherty], 2,615,921, October 28, 1952.

The parties do not disagree as to the teachings of the above references. Dougherty discloses the oxidation of C_4 to C_{20} hydrocarbons with oxygen under pressure and at a temperature in the range of 230° to 450° F. The specification in Dougherty provides:

> The hydrocarbons that are oxidized in accordance with our process are those hydrocarbons that are liquid at the reaction conditions. These hydrocarbons preferably contain from 4 to 20 carbon atoms per molecule, and they include aromatics, aliphatics, cycloaliphatics, aralkyls and alkaryls. Typical examples of these hydrocarbons are butane, pentane, hexane, heptane, octane, cyclobutane, cyclopentane, cyclohexane, methylcyclohexane, cycloheptane, benzene, toluene, xylene, ethylbenzene, tertiarybutylisopropyl benzene, diisopropylbenzene, cyclohexylbenzene, propylbenzene and butylbenzene. * * *

Moell and French disclose the oxidation of cyclooctane with oxygen.

It is readily apparent that the process defined by the appealed claims is analogous to each of the processes disclosed by the references. Appellants do not argue otherwise. Rather, appellants argue that considering the claimed process as a whole, including the starting material, it would be unobvious to substitute cyclododecane for cyclooctane or cycloheptane.[2] In support of this argument, appellants have submitted certain references:

Ziegler et al., Annalen der Chemie, vol. 513, pp. 43–64 (1934) [Ziegler].

Prelog, Jour. Chem. Soc. (London, 1950), pp. 420–428.

According to appellants, Ziegler

> * * * describes a series of comparative experiments with the members of a homologous series of ring compounds containing from 5 to 20 carbon atoms showing that as a group there is a rather sharp divergence in properties as between the C_9–C_{12} members and the others, both higher and lower.

[1] In application Ser. No. 44,836, filed July 25, 1960. No claims have been allowed.

[2] Appellants appear to argue that the invention defined by the appealed claims is a new and useful process within the meaning of 35 U.S.C. 101 and not a new use of a known process. See 35 U.S.C. 100. We will consider the issue raised under 35 U.S.C. 103 on that basis.

As to the Prelog publication, appellants state:

> * * * This paper likewise describes a series of comparative tests with ring compounds containing from 5 to 20 carbon atoms. These data, while different in certain respects from those obtained in the earlier work of Ziegler et al., nevertheless carry forward and confirm the finding that a sharp and unpredictable discontinuity in the chemical and physical properties of the C_9–C_{12} ring compounds exists.

The references of record may be summarized as follows: Dougherty, Moell and French teach the general process steps claimed by appellants. Moell and French teach specifically the utilization of cyclooctane, C_8H_{16}, as a starting material. Dougherty discloses the oxidation of C_4–C_{20} hydrocarbons and teaches specifically cycloheptane, C_7H_{14}, as a starting material. Ziegler and the Prelog publication teach generally, without relation to the process claimed here, that a sharp and unpredictable discontinuity in the chemical and physical properties of the C_9–C_{12} ring compounds exists.

The question here is whether, considering the differences between the subject matter as a whole and the prior art, the subject matter would be obvious to one of ordinary skill in the art under the conditions stated in 35 U.S.C. 103. The subject matter as a whole includes the claimed process in relation to the starting material.

In view of both the general and specific teachings of the prior art relied on by the Patent Office, we think appellants' claimed process would be obvious to one of ordinary skill in the art. The more *general* teachings of the references cited by appellants fall short of dispelling the prima facie case of obviousness of the claimed process in view of both the general and specific teachings cited by the Patent Office.

[2] Appellants have not come forward with any showing which would suggest that the claimed process would not have been obvious to one of ordinary skill in this art. In the final analysis, the person of ordinary skill in the art is required to evaluate and weigh the teachings of all the references as a whole. The general teachings of references relied on by appellants are not such that one of ordinary skill in the art would consider the claimed process to be unobvious.

Appellants argue that our decision in *In re Mills*, 47 CCPA 1185, 281 F.2d 218, 126 USPQ 513, is persuasive authority for holding the invention in this appeal is unobvious. The Solicitor in reply argues that Mills may be distinguished on the ground that in Mills a *composition* was claimed while here the claim is to a *process*.

[3] In Mills we rejected any doctrine of "legal presumption of obviousness." In analyzing the deficiencies of the prior art teachings relied on as establishing the composition claimed as obvious we stated:

> On the record before us, to reach the conclusion reached by the Board, we are required in some way to bridge the factual gap between the Lewis disclosure of the C_8 to C_{12} alkyl sulfates and applicant's claim for use of the C_1 alkyl sulfate with respect to a specific property, i.e., the inhibiting of caking in a detergent composition containing an alkyl aryl sulfonate detergent. The Board and the Examiner have substituted what the Board terms a "legal presumption" for factual data, which is missing from the record, and without which a proper decision as to obviousness cannot be made.

We think the factual gap found in the prior art teachings in Mills has been filled here. The references in support of the rejection teach analogous processes employing specific reactants having 7 or 8 carbon atoms in the ring and also disclose generally that reactants possessing 4 to 20 carbon atoms in the molecule may be employed. The principles

in Mills are applicable here and the art of record conforms to those principles.

[4] Here, as in *In re Lunsford* (PA 7512), 53 CCPA —, — F.2d —, — USPQ —, decided concurrently herewith, we regard the use of prior art teachings under 35 U.S.C. 103 as a two-way street, available to both parties. We are required to evaluate the references *as a whole* regardless of the party offering the references. In *Lunsford*, we refused to ignore specific teachings which we believed would be given greater weight than general teachings by one of ordinary skill in the art. We evaluated the references against the invention as a whole as required by 35 U.S.C. 103 and gave effect to the uncontraverted specific teachings which were contrary to the position of the Patent Office. Here, we think that the specific teachings offered by the Patent Office show the obviousness of the claimed process to the satisfaction of one of ordinary skill in the art.

[5] The decision of the Board is therefore *affirmed*.

AFFIRMED.

U.S. Court of Customs and Patent Appeals

IN RE IVAR JEPSON

No. 7575. Decided March 17, 1966

[53 CCPA—; 357 F.2d 406; 148 USPQ 736]

1. REJECTION—BASIS—WORDS AND PHRASES—"UNPATENTABLE OVER"—35 U.S.C. 102 AND 103.

"The term 'unpatentable over,' standing alone, means only that the claims are rejected in view of the reference and each case must be examined to ascertain the precise grounds of rejection [whether under 35 U.S.C. 102 or 103]."

2. SAME—SAME—STATUTORY GROUNDS OF REJECTION SHOULD BE STATED—35 U.S.C. 132.

"It must be said, however, that there is no justifiable reason that a case should appear in this court absent a statement of the position of the Patent Office as to the statutory grounds of rejection. It is contrary to statute (35 U.S.C. 132) and involves a needless waste of time of the appellant and the Solicitor's Office, briefing and arguing the question; and of the court's time, deciding the question."

3. PATENTABILITY—PARTICULAR SUBJECT MATTER—"LAWN SPRINKLER."

The decision of the Board of Appeals, refusing certain claims in an application entitled "Lawn Sprinkler" as unpatentable over the prior art, is reversed.

APPEAL from the Patent Office. Serial No. 188,407.

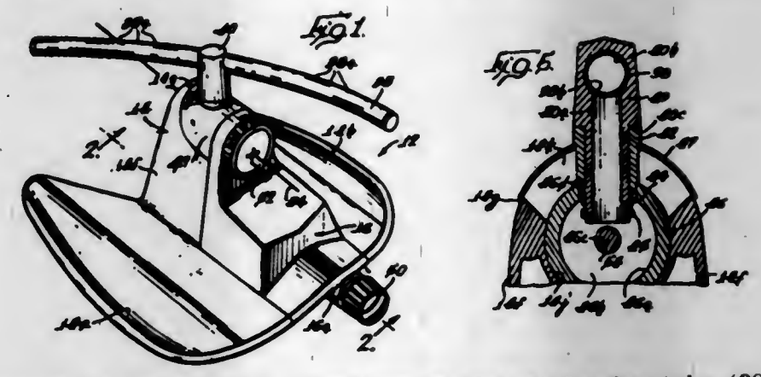
REVERSED.

Neil A. Rose, Homer M. Rose, George R. Clark (*Homer R. Montague* of counsel) for appellant.

Joseph Schimmel (*Jere W. Sears* of counsel) for the Commissioner of Patents.

Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, *Jr., Associate Judges*, and Judge WILLIAM H. KIRKPATRICK, *United States Senior District Judge for the Eastern District of Pennsylvania*

SMITH, *J.*, delivered the opinion of the court.



This appeal presents two issues for determination: first we must decide, in the light of the arguments presented to this court, the opinions of the Board of Appeals, and the record, whether the appealed

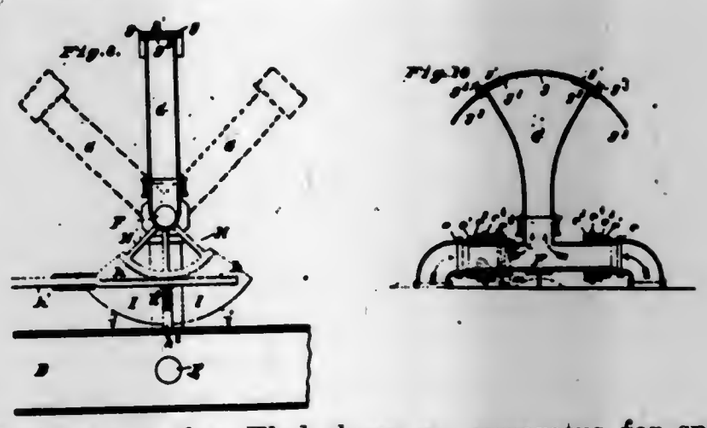
claims[1] stand rejected on 35 U.S.C. 102 or 103; and second, whether the rejection may be sustained.

We hold on the first issue that the rejection is under the terms of 35 U.S.C. 103 and on the second issue that it cannot be sustained.

The Invention and the Prior Art

The invention defined by the appealed claims is an oscillating water sprinkler for watering lawns. Claim 1, quoted by the Board, describes the invention when considered with Figs. 1 and 5 herein reproduced:

1. An oscillating sprinkler comprising an elongated spray tube (38), carrier means (46, etc.) for said spray tube pivotal about a horizontal axis (54), a water motor (inside housing) operable to oscillate said carrier about said axis, means (40, 42) mounting said spray tube on said carrier for selective manual positioning (47) at various angles to said axis, and means (40, 46, etc.) defining a water conduit for supplying water to said spray tube, said last-mentioned means being water sealed (40, 42, 46) at any of said various angles of positioning of said spray tube.



According to appellant,

The present invention provides means for varying the length and width of the spray pattern while at the same time utilizing a rigid spray tube. This variation in the width of the spray pattern is accomplished by rotating the spray tube about an axis which, in the preferred embodiment, is perpendicular to the axis about which it oscillates. As a result of this rotation, the spray tube is not always parallel to the axis of oscillation as in the conventional oscillating sprinkler.

The appealed claims stand rejected in view of the teaching of one patent:

Flad, 288,222, Nov. 13, 1883.

The teachings of Flad, describing an "Apparatus for Sprinkling Streets," are best understood by considering portions of Figs. 8 and 10 of that reference:

The parties agree that Flad shows an apparatus for sprinkling streets wherein rack *h* causes oscillation of nozzle G (Fig. 8) and

[1] In application Ser. No. 188,407, filed April 18, 1962, entitled "Lawn Sprinkler." The Examiner allowed three claims. Claims 1–9 are here on appeal.

curved plates g^2 may be moved for adjustment of the width of the spray pattern. The Board concerned itself with a single structural feature of Flad. It observed that if the nozzle of Flad, which Flad stated was "screwed" to hollow shaft F, was rotated the *width* of the spray pattern could be controlled in proportion to the amount of rotation without utilizing the curved plates g^2.

The Rejection

The Board in its decision reversed the rejection of the Examiner. It then stated:

> Under the provisions of Rule 196(b) claims 1 to 9 are rejected as unpatentable over the Flad patent. * * *

The Board did not elaborate further on its rejection of "unpatentable over" and, so far as relevant here, considered the appealed claims together.

Appellant, interpreting the Board's decision in his petition for rehearing, stated:

> While the rejection seems to tacitly admit that there is no actual disclosure or contemplation in the Flad patent of rotating the nozzle G with respect to the hollow shaft F, the position is taken that Flad "provides a means which mounts to spray tube on the carrier F for selective manual positioning." The gist of the rejection appears to be that there is no invention involved in providing an adjustable connection between the spray nozzle and the oscillating carrier.

The Board, in its decision on rehearing, stated in answer:

> Appellant states * * * that our rejection involves "providing" an adjustable connection in Flad. This is in error since our rejection is based on the fact that a threaded connection is of itself an adjustable connection and the claims read directly on Flad without anything being "provided" therein.

The Board also stated the rejection was proper despite the "different structure" shown in the reference in view of the structure appellant "broadly claimed."

Appellant argues that while he suspected the basis of the Board's new rejection was section 103 after the Board's first decision, the language ("the claims read directly on Flad") used by the Board in its second opinion clearly establish that section 102 was intended.

The Solicitor's arguments in rebuttal are fourfold: First, it is argued that "The Board's rejection of claims 1–9 'as unpatentable over the Flad patent' signifies a section 103 rejection," citing in support thereof the *dissenting* opinion in *In re Hughes*, 52 CCPA 1355, 345 F.2d 185, 145 USPQ 467, "particularly footnote 5. [sic, footnote 2?]" We are unconvinced by this argument or the citations in support thereof. The majority opinion in *Hughes* rejected a like argument and even the dissenting opinion in *Hughes* does not support this proposition. Moreover, the Solicitor's argument here that "unpatentable over" *per se* means section 103 is contrary to the position argued by the Solicitor in *In re Molnar*, PA 7590, presently pending before this court. In *Molnar* it is urged that "unpatentable over" *per se* means *both* sections 102 and 103, citing *In re Foster*, 52 CCPA 1808, 343 F.2d 980, 145 USPQ 166. [1] The term "unpatentable over" standing alone, means only that the claims are rejected in view of the reference and each case must be examined to ascertain the precise grounds of rejection.

Second, it is argued that appellant had adequate notice of the statutory ground of rejection, meaning section 103, and his remedy, if any,

was by way of Rule 196(b), citing the following principle from *Hughes*, supra, at 145 USPQ 469:

> * * * And if the new ground of rejection is properly identified as such, the applicant is in no way prejudiced, for he has the benefit of the adequate procedural safeguards of Rule 196(b).

The above principle is applicable where new grounds of rejection are *properly identified as such*. This argument is of no help in surmising what statutory ground of rejection the Board intended.

Third, it is argued as follows:

> Before the Patent Office, at least, this lack of concern over statutory sections is common. Many practitioners realize that success in establishing some difference over a given reference merely invites consideration of a larger question, viz. whether or not "the differences . . . are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art. . . ." Hence, the more comprehensive section 103 question is oftentimes argued, rather than leave the job half done.

Apparently this argument has two aspects: first, it is offered in candor and honesty to explain the practice before the Patent Office; and second, it seeks to establish that appellant argued the "section 103 * * * question rather than leave the job half done." We think it would be directly contrary to the express terms of 35 U.S.C. 132, to condone such a "lack of concern" if it does exist and, further, would be contrary to our decision in *Hughes*, supra, to *assume* that appellant argued section 103.

Finally, it is argued as follows:

> * * * Contrary to appellant's position * * * the aforesaid portion of the Board's statement concerning readability of the claims on Flad should not be broadly construed, out of context and in a literal sense. * * * There remain acknowledged and manifest differences which belie any reasonable inference that the Board was characterizing its rejection here as being under 35 U.S.C. 102.

Proceeding in the proper manner to determine the statutory ground of rejection intended, from the records and briefs before us, and considering the oral argument, we are convinced that the Board intended section 103. As we find that this rejection may not be sustained we need not consider the possible prejudice to appellant arising from the failure of the Patent Office to comply with 35 U.S.C. 132. [2] It must be said, however, that there is no justifiable reason that a case should appear in this court absent a statement of the position of the Patent Office as to the statutory grounds of rejection. It is contrary to statute (35 U.S.C. 132) and involves a needless waste of time of the appellant and the Solicitor's Office, briefing and arguing the question; and of the court's time, deciding the question.

The Merits of This Appeal

Appellant's position is clear: the subject matter defined in the italicized portion of appealed claim 3, set forth below, differs from Flad and would not be obvious in view of Flad.

> 3. An oscillating sprinkler comprising an elongated spray tube, carrier means for said spray tube pivotal about a horizontal axis, power means drivingly connected to oscillate said carrier means about said axis, a water conduit extending from said spray tube transversely of the length of said spray tube, and *means mounting said water conduit on said carrier means for rotation about an axis perpendicular to said horizontal axis to vary the size of the spray pattern of said sprinkler, said means mounting said water conduit including a rotary water seal and retaining means for holding said spray tube in any selected rotary position with respect to said carrier means.*

Appellant explains:

The italicized portion of the claim represents the significant aspect of the claim by means of which it defines patentably over the prior art. Owing to the fact that Appellant's invention in its broadest aspect involves the addition of the spray pattern width adjustment means to a conventional oscillating sprinkler, the elements of claim 3 which are not italicized above are admittedly conventional and old in the art of oscillating sprinklers. The other claims on appeal are similar in reciting more or less conventional oscillating sprinkler structure and including in the combination the novel mounting of the spray tube which provides the heretofore unknown width adjustment of the spray pattern.

Each and every one of the claims on appeal recites the structure permitting this adjustment between the spray tube and the oscillating means supporting the spray tube. * * *

The Solicitor argues:

* * * There is no warrant for assuming Flad did not appreciate that a normal pipe joint connection between carrier F and nozzle G would afford suitable positioning of the latter. On the other hand, he [Flad] was apparently unaware of its possible use in varying the width of the spray pattern in appellant's manner, relying instead on slide plates g' therefor. This is of no consequence here, since an ordinary threaded pipe joint between his carrier F and nozzle G could be used to effect a width adjustment in appellant's manner. This was recognized by the Board (R-59). "A mechanical patent is anticipated by a prior device of like construction and *capable of performing the same function*," *Carnegie* v. *Cambria*, 185 U.S. 403, 424 * * *.

We do not think that the Flad device, as interpreted by the Solicitor, is of like construction which performs the same function as appellant's device nor does it make obvious "a rotary water seal and retaining means for holding said spray tube in any selected rotary position with respect to said carrier means," as defined in claim 3. We think it is too strained an argument to maintain that an adjustable width spray pattern may be obtained in the Flad device, by initially ignoring the teachings of Flad, and construing a "screwed" connection to mean "a rotary water seal and retaining means." See *In re Thornhill*, 49 CCPA 1179, 305 F.2d 463, 134 USPQ 181.

Considering the differences between the subject matter sought to be patented and the teachings of the *single* prior art reference of record, we do not find that the subject matter *as a whole* would have been obvious at the time the invention was made to a person having ordinary skill in this art. 35 U.S.C. 103.

[3] The decision of the Board is reversed.

REVERSED.

KIRKPATRICK, *J.*, dissenting.

I cannot agree with the decision of the majority as to the non-obviousness of the invention. The majority opinion points out that the sprinkler nozzle of Flad is attached by a threaded connection to his oscillating carrier, and it appears to me quite obvious that, if the nozzle is turned on its thread, the width of the spray pattern will vary. The fact that Flad preferred other means to vary the width of the pattern does not affect the obviousness of this physical fact.

Given this disclosure, providing a joint which permits the rotation of the nozzle, means to make the joint water-proof and means to keep it in the desired position, produces no new functions with respect to the parts individually nor any new or surprising result of the parts assembled as a whole. The Supreme Court in *Graham* v. *John Deere Co.*, February 21, 1966, has set forth the tests for obviousness under 35

U.S.C. 103 which, when applied to the facts here, should, I believe, result in the affirmance of the Board.

U.S. Court of Customs and Patent Appeals

IN RE HAROLD W. ADAMS

No. 7611. Decided March 17, 1966

[53 CCPA —; 356 F.2d 998; 148 USPQ 742]

1. APPEAL TO U.S. COURT OF CUSTOMS AND PATENT APPEALS—JUDICIAL NOTICE OF COMMON-PLACE CONSUMER ITEMS.

"Under the circumstances of this case, which includes the availability of Aghnides' aerator nozzles for 13 years before the Mencacci cooler was disclosed, not only as presumptively available prior art by virtue of the issued patent but, we judicially notice, as commercially available and very common-place consumer items, we deem it very significant that Adams was the first to suggest, as far as the record shows, the use of aerated streams in a water spray cooler for cans or other rounded objects."

2. PATENTABILITY—PARTICULAR SUBJECT MATTER—"HEAT TRANSFER METHOD."

The decision of the Board of Appeals, refusing certain claims in an application entitled "Heat Transfer Method" as unpatentable over the prior art, is reversed.

APPEAL from the Patent Office. Serial No. 81,082.

REVERSED.

Almon S. Nelson for appellant.

Joseph Schimmel (*Fred W. Sherling* of counsel) for the Commissioner of Patents.

Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, Jr., *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK, *United States Senior District Judge for the Eastern District of Pennsylvania*

RICH, *Acting Chief Judge*, delivered the opinion of the court.

This appeal is from the decision of the Patent Office Board of Appeals affirming the rejection of claims 11–15 of application Serial No. 81,082, filed January 6, 1961, for "Heat Transfer Method." No claims have been allowed. The sole issue is the obviousness of the invention under 35 U.S.C. 103.

The invention is exemplified by reference to the cooling of cans of food as they emerge in a continuous stream from a cooker in which the food has been cooked in sealed cylindrical cans. Cooling takes place in apparatus upon which appellant has improved, the basic machine being described in the principal reference relied on to support the rejection, U.S. Patent No. 2,794,326, entitled "Method and Apparatus for Cooling Canned Goods," issued June 4, 1957, to Mencacci, assignor to Food Machinery and Chemical Corporation, San Jose, California. Appellant Adams, according to his affidavit of record, is a staff research chemist employed by the "Canning Machinery Division of FMC Corporation at San Jose, California." At argument it appeared that the Mencacci patent and the present application are in common ownership.

A brief description of the Mencacci cooler will aid in understanding appellant's admittedly novel method since one of the principal ways of practicing it, as described in the application, is by modifying the Mencacci apparatus and the method it carries out.

The application describes the involved cooler as of "the well known reel and spiral type * * *." It is a large horizontal cylindrical ma-

chine having within the supporting framework an exterior helical track for cans inside of which is a reel, coextensive with the helix, having can-holding compartments formed by longitudinal angle bars. Cans are fed in at one end and drop into the compartments on the reel and as the reel rotates the helical tracks cause the cans supported on the reel to move in a helical path from one end of the cooler to the other. The helical track pushes them along the compartments on the reel and the angle bars which form the compartments push the cans around the track as the reel rotates. At the bottom portion of each revolution the cans roll on the track so that their contents are stirred up which helps to dissipate heat from the inside.

From the drawings of appellant's application and Mencacci it would appear that two or three dozen cans would be present in each turn of the helix and that there might be fifty or sixty turns. One or two thousand cans would therefore be going through the cooler at the same time. As they progress from the hot to the cold end, they are cooled by the application of water. It is in the mode of this application that the invention resides.

In the Mencacci cooler water is sprayed onto the cans from spray nozzles, said to produce "jets" of water, the nozzles being attached to headers which extend along the top of the cooler. It would seem that one nozzle is used for each revolution of the helical track. The headers are arranged in three groups or cooling zones. The used water is caught in the bottom of the cooler in these zones and is recirculated by pumps in a selective way so that, for instance, the water at the cold end of the cooler, which becomes warmed in cooling the cans, is reused in the middle zone where the cans are hotter and the water from that zone is reused at the hot entrance end so that the hotter the cans the warmer is the water sprayed on them. Thus the temperature differential between the cans and the water is about the same in each zone. It is said that an excessive differential might damage the cans. In addition to the above-described sprays, which impinge upon the upper sides of the cylindrical cans at the top of the machine, Mencacci has header pipes coaxial with the reel, in the center of the cooler, provided with nozzles which spray water "radially in substantially all directions," which water impinges on the surrounding cans as they traverse their helical paths.

Appellant's application, referring to known coolers, evidently of the Mencacci type, says that the water is sprayed onto the containers "by fan type sprays or the like, as the cans pass continuously through the cooler."

Appellant has substantially increased the efficiency of coolers of the above type, by 26% he alleges in his specification, through the seemingly simple expedient of replacing the fan spray nozzles with a ubiquitous little device, the no-splash water aerator common to household kitchen sinks for a generation and now even more common in the modern washbasin. The broad statement of his invention is:

> In accordance with the present invention, it has been discovered that replacement of the fan-type spray nozzles with aerating or foam nozzles greatly improves the cooling efficiency of the above cooler.

The Patent Office says this invention is obvious, citing an Aghnides patent, No. 2,811,340, issued October 29, 1957, the same year the Mencacci patent issued, but also relying more heavily on an earlier

Aghnides patent, No. 2,210,846, issued August 6, 1940, and mentioned in the "Aghnides patent of record." [1]

Both Aghnides patents relate to and describe various forms of the now commonplace water aerating attachment for faucets and it is not seen that we need describe them further other than to make clear that what they do is to entrain in the stream of water issuing from the faucet a multitude of air bubbles and break up the air-water mixture into fine streams by means of screens, thus producing "white water" with no-splash characteristics. We believe most everyone is familiar with this phenomenon as described in the passage from the Aghnides patent not "of record" before the Board on which the Patent Office now particularly relies as the most significant prior art teaching, reading:

> When my device is functioning, the water, due to the thorough admixture of air, has characteristics which are surprisingly different from those of water as ordinarily discharged from a faucet. For example, if one's hand is put in the course of the water, the water will flow evenly and uniformly over the surface and will wet the entire surface without splashing.

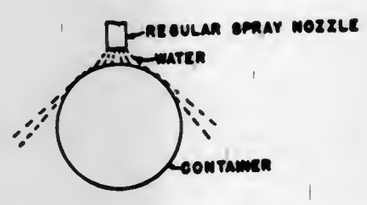
This suprising result was disclosed to the Patent Office in December 1937, in a corresponding Belgian application in 1934 (according to the patent heading), and to the world in the issued U.S. patent in 1940. Thirteen years later, June 26, 1953, Mencacci applied for his patent on the can cooler employing jet spray nozzles and six and a half years after that appellant filed his application teaching how to improve its efficiency by 26%, primarily by using Aghnides' aerator on it instead of sprays. It is now contended that that improvement has always been obvious by reason of certain "axiomatic" principles. We disagree.

Illustrative of the claims on appeal is claim 13, which reads:

> A method of cooling containers having rounded exterior surfaces consisting of the steps of
>
> moving the containers along a helical path generated about a horizontal axis,
>
> directing cooling water tangentially of said path and downward at spaced points along said helical path toward the exterior surfaces of the containers as they move downwardly,
>
> introducing air into said water prior to the contact of water with the containers to form a foam coolant having qualities which minimize splashing and encourage the even spreading of the foam upon contact with the containers to more effectively follow the contour of the containers and wet the containers,
>
> and forming coatings of said foam in heat-transfer relation substantially entirely around the exterior surfaces of the containers.

The meaning of this claim will best be appreciated by reference to sketches in Adams' affidavit explaining the difference in action of a regular jet spray and a foam spray when projected at a rounded exterior surface such as a food can.

FIG. 1



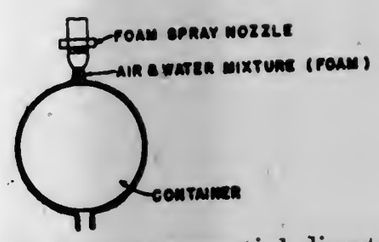


FIG. 2

What appellant means in his claims by the tangential direction of the water streams will be understood from his description of the

[1] According to appellant's brief, the Examiner had also relied on a third Aghnides patent, No. 2,633,343. We have not seen this patent.

apparatus in which he places two water headers above the cooler, one at 30° to the right of the vertical axis, as viewed from one end, and the other 60° to the left, or 90° apart. The aerator nozzles thereon are positioned to direct streams downwardly and along paths substantially tangent to the reel on opposite sides of the cooler. Of course the cans are moving beneath the streams as the reel revolves, and are wetted once on coming up and again on going down.

In the application Adams says:

> Although it is not completely understood why the foam spray improves the cooling rate, the above tests and visual observations indicate that the air entrained in the cooling water cushions the impact of water upon the cans thereby greatly minimizing the splashing of water from the cans and also causing the water to follow the contour of the cans to wet substantially the entire surface thereof.

There are two significant facts with respect to the references. Mencacci says nothing whatever about using aerated water for cooling. Aghnides says nothing whatever about using any of his nozzles or the aerated streams produced thereby for cooling or for heat exchange.

The Examiner in his answer said the only real issue is whether the Mencacci and Aghnides patents "can be combined in rejecting the claims." This quite common but relatively meaningless statement does not state the real issue at all and it is not now and never has been clear what the expression "can be combined" is supposed to mean. The real and only issue under 35 U.S.C. 103 is whether the invention as a whole would have been obvious to those skilled in the art at the time Adams made it in view of the state of the art as we are able to glean it from the references cited. Of course *all* of the references may be used to show what the art knew, and in that sense "combined" but the fact remains that neither reference contains the slightest suggestion to use what it discloses in combination with what is disclosed in the other.

[1] Under the circumstances of this case, which includes the availability of Aghnides' aerator nozzles for 13 years before the Mencacci cooler was disclosed, not only as presumptively available prior art by virtue of the issued patent but, we judicially notice, as commercially available and very commonplace consumer items, we deem it very significant that Adams was the first to suggest, as far as the record shows, the use of aerated streams in a water spray cooler for cans or other rounded objects.

The Patent Office presents a number of hindsight arguments. It says Adams was not the first to *use* foam for *heat transfer* as fire departments and fire extinguisher users have been squirting foam on fires for years and housewives have been pouring aerated hot water on cold plates in the kitchen sink for years, in both of which operations heat transfer is *inherent*. Of course it is inherent, otherwise appellant's invention would not work. But patentability here does not hinge on inherency. It depends on the unexpected and unsuggested increase in heat transfer *efficiency*. No reference suggesting this has been produced, only ex post facto explanations as to why anyone should have been able to see that it would be more efficient to use aerated water. But even Adams, with a college degree in chemistry and a doctorate in food technology eight years before he made his invention, explained, after the completion of his invention, that it was not quite clear why the improved efficiency results. The Examiner made no attempt to explain why it would be obvious, other than to say aerating or foaming *rinse* water is commonplace. The Board opined that "it is axiomatic that heat transfer will be improved by subjecting articles to be cooled to a stream of cooling liquid with minimum waste by splashing and a stream which is so formed that the contact between the articles and the stream particles is increased." It felt using Aghnides nozzles to reduce splashing and increase contact would be an obvious change in a heat transfer method but we regard this as mere hindsight analysis of appellant's teaching with no basis at all in the absence of access to his teachings. It seems to us that one of the primary objects of Mencacci was to *splash* water on his cans. In his cooling method, as carried out in his cooler, the wetting is not continuous but intermittent and an important part of the cooling method as described in the Mencacci patent is in the use of air, produced by a blower, to evaporate liquid from the cans after wetting them. He says:

> The cool air thus supplied displaces the warm air within the chamber and accelerates the dissipation of heat from the cans by both *convection* and *conduction*. * * * The fresh air supplied by the fan therefore promotes *evaporation* of moisture on the can surfaces, and thereby increases to a very considerable degree the amount of heat which is absorbed from each can in the process of vaporization of the moisture. Dissipation of heat by each of *the three principles of heat loss* by the cans and their contents is still further expedited by the tumbling * * *. [Emphasis ours.]

This evaporation is a function of the machine throughout the cooling process and the machine was designed to wet the cans from all sides, the water dripping from the cans being recirculated. We see nothing to suggest any need for an improved wetting of the cans. We find no teaching, axiomatic or otherwise, to suggest the greater efficiency which Adams has discovered.

Finally, the Solicitor adds the argument that the *superiority* of appellant's heat transfer is *inherent* in the use of foam. Again we observe that, of course, it is. But the art does not suggest the use of foam in heat transfer of any kind and there is not the slightest suggestion that anyone *knew* of the existence of this inherent superiority until Adams disclosed it. After all, Bell's telephone was "inherently" capable of transmitting speech, De Forest's triode was "inherently" capable of amplification, and, to come down to date, so was the tiny transistor which is rapidly supplanting it. Two of our decisions are cited as supporting the erroneous notion that "subject matter cannot be patented on the basis of an inherent property." We think the proposition thus broadly stated and as applied here is so transparently erroneous as not to require discussion.

We deem it unnecessary to deal with the differences in scope and the broadest claim as effectively distinguishes from the references as any of the others.

[2] The decision of the Board is reversed.

REVERSED.

U.S. Court of Customs and Patent Appeals

WALDES KOHINOOR, INC. *v.* ASSOCIATED SPRING CORPORATION

No. 7602. Decided March 24, 1966. Petition for rehearing denied May 5, 1966

[53 CCPA —; 357 F.2d 404; 149 USPQ 68]

1. TRADEMARK—CONFUSING SIMILARITY—"TRU-TRAC" FOR SPRINGS AND "TRUARC" FOR RETAINING RINGS.

"Here we are confronted with a situation where the goods of the parties are substantially similar and sold to the same class of purchasers through

the same channels of trade, with use on the part of the appellant over a long period of time involving the expenditure of a large sum of money in establishing its mark. In our view, the mark TRU-TRAC is sufficiently similar to the mark TRUARC in sound, appearance and over-all impression so that the simultaneous usage in trade of the respective marks is likely to cause confusion within the meaning of section 2(d) of the Trademark Act of 1946. Any doubt as to likelihood of confusion should be resolved in favor of the first user and against the newcomer."

APPEAL from the Patent Office. Opposition No. 42,799.

REVERSED.

Arthur H. Siedel for appellant.

David S. Schrivener for appellee.

Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, JR., *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK, *United States Senior District Judge for the Eastern District of Pennsylvania*

ALMOND, *J.*, delivered the opinion of the court.

Waldes Kohinoor, Inc., appeals from the decision of the Trademark Trial and Appeal Board dismissing its opposition [1] to the application of Associated Spring Corporation to register "TRU-TRAC" for springs [2] asserting use since May 22, 1961. Appellant (opposer) is the registrant of the mark "TRUARC" for retaining rings for locking, securing, or positioning moving parts, such as shafts, gears and bearings [3] and for tools, namely, grooving tools, and pliers, applicators, and dispensers for retaining rings.[4] Only appellant took testimony. There is no issue relating to priority of use.

Under the provisions of Trademark Rule 2.123(c), appellee (applicant) submitted copies of a number of third-party registrations for marks which either comprise the terms TRU-ARC and TRU-TRAC, or include TRU as a prefix, or ARC or TRAC as suffix portions. In substance, these registrations cover goods such as various hand tools, items of hardware and machinery.

The record supports the finding of the Board that since long prior to appellee's asserted date of first use, appellant has used the mark TRUARC on the goods recited in its registrations; that it had extensively advertised its TRUARC retaining rings in nationally known and circulated trade publications as well as in catalogs and at trade shows; that sales of TRUARC rings and tools therefor have averaged three million dollars per year during the past five years, and that said rings are, in effect, springs, since they have a spring action as an essential characteristic. The record also shows that customers, in placing orders for retaining rings, sometimes mistakenly write appellant's trademark as TRU-ARC or as TRU ARC.

Appellee contended before the Board, as it does here, that there is a difference in the goods of the parties because its springs are sold in a tightly wound coil form and the goods would move through different channels of trade and be used for different purposes. The Board noted, however, that the goods recited in the application are springs per se, and that appellee admitted in its answer to the notice of opposition that a retaining ring is a specific form of spring and further admitted that both parties manufactured retaining rings and

[1] Opposition No. 42,799, filed April 26, 1963.
[2] Serial No. 146,779, filed June 13, 1962.
[3] Reg. No. 402,923, issued August 24, 1943.
[4] Reg. No. 595,877, issued September 28, 1954.

are therefore competitors in that field of manufacture. The Board concluded, and we agree, that in view of the above:

* * * and in the absence of any evidence to support applicant's claim as to the limited nature of its goods, it must be held that the goods of the parties would move through the same trade channels to the same purchaser for the same or related uses.

The only issue here is likelihood of confusion within the meaning of section 2(d) of the Trademark Act of 1946 (15 U.S.C. 1052).

A majority of the Board, one member dissenting, concluded that confusion or mistake would not be likely to occur. The majority reasoned that the competing marks were readily distinguishable whether considered as one word, two words or in hyphenated form and that the term TRUARC is highly suggestive of a desired characteristic of appellant's goods and could not, therefore, be accorded the broad scope of protection applicable to entirely arbitrary terms. It considered both marks highly suggestive as applied to springs but did not believe such marks convey the same or similar meanings as applied thereto.

We are, however, inclined to agree with the views stated and the conclusion reached by the dissenting member of the Board that while appellant's mark may be in some manner suggestive as applied to its goods, there is nothing in the record to show that it is in any way lacking in trademark significance. He pointed out that none of the third-party registrations, relied on by appellee to establish the weakness of appellant's TRUARC mark, were for retaining rings or springs and hence irrelevant for this purpose. He noted, as do we, the extensive sales and advertising disseminations with unsolicited references in trade publications as indicative of the fact that the wark TRUARC has achieved a considerable measure of commercial recognition as identifying appellant's retaining rings or springs. He pointed, we think significantly, to the fact that more than twenty years had elapsed after appellant's adoption and use of TRUARC before appellee, a competitor, adopted the mark TRU-TRAC for similar goods, and that there is no evidence of adoption or use of marks similar thereto by others in the trade here involved.

Comparing the marks TRU-TRAC and TRUARC in their entireties, we are in agreement with the dissenting member of the Board that:

* * * they are substantially similar in appearance, each comprising two syllables, of which the initial syllable is identical, and considering that the suffixes have three identical letters and both end in a hard "c" sound, they also are somewhat alike in sound. In view of these similarities, and considering that purchasers of springs or retaining rings do not ordinarily have the opportunity for a side-to-side comparison of the marks under which such goods are sold, it is not unreasonable to assume that persons familiar over the years with "TRUARC" retaining rings or springs, who on occasion, as the record discloses, have written opposer's mark as "TRU-ARC" or "TRU ARC," might well upon encountering other springs under the mark "TRU-TRAC" mistakenly assume that they originate with the same producer * * *.

[1] Here we are confronted with a situation where the goods of the parties are substantially similar and sold to the same class of purchasers through the same channels of trade, with use on the part of the appellant over a long period of time involving the expenditure of a large sum of money in establishing its mark. In our view, the mark TRU-TRAC is sufficiently similar to the mark TRUARC in sound,

appearance and over-all impression so that the simultaneous usage in trade of the respective marks is likely to cause confusion within the meaning of section 2(d) of the Trademark Act of 1946. Any doubt as to likelihood of confusion should be resolved in favor of the first user and against the newcomer. *American Grease Stick Co.* v. *Chemplast*, 52 CCPA 1103, 341 F.2d 942, 944, 144 USPQ 676, 677.

The decision of the Trademark Trial and Appeal Board is reversed.

REVERSED.

SMITH, *J.*, dissenting.

The cumulative effect of the specific differences in the marks and in the goods on which they are used when considered in the light of the reasonably expected sophistication of the purchasers leads me to the conclusion that there is no likelihood of confusion in the present case. The marks themselves possess only a common similarity in prefix such as is found in other marks used with various kinds of goods. Viewed as wholes, the marks in issue have distinctive differences as well as similarities in meaning. In my opinion the differences in the technical meanings attributable to the suffix portions of the marks when considered with the specific goods to which they are applied would be more likely to accentuate these differences than it would their similarities. The technically oriented purchasers of such goods would not be likely to confuse the marks or the goods.

I would therefore affirm the decision of the majority of the Trademark Trial and Appeal Board to dismiss the opposition.

U.S. Court of Customs and Patent Appeals

IN RE EDWARD S. BLAKE AND WILLIAM C. HAMMANN

No. 7555. Decided April 7, 1966

[53 CCPA —; 358 F.2d 750; 149 USPQ 217]

1. PATENTABILITY—AFFIDAVIT UNDER RULE 131—SUPPLEMENTARY AFFIDAVITS FILED SUBSEQUENT TO BOARD'S DECISION.

"The Solicitor urges this court not to consider the affidavits filed subsequent to the Board's decision. Under the facts of this case, we are unable to agree with the Solicitor. The affidavits filed subsequent to the Board's decision did not contain any additional material averments or factual evidence. Rather, the affidavits consisted of original compilation sheets on which was written the data recited in the earlier affidavits. Thus, the Board was not faced with the task of considering evidence which had not been considered by the Examiner and by the Board itself in its original decision. Moreover, at no time did the Examiner criticize the affidavits for their lack of showing that the data was not obtained prior to Diamond's filing date. This matter was raised for the first time by the Board. Additionally, the earlier filed affidavits contained averments that the data set forth therein was obtained prior to Diamond's filing date."

2. SAME—SAME—REDUCTION TO PRACTICE—TESTS.

"This court has made it clear that whether or not testing of an invention is required to establish utility, and if so, the nature and extent of such testing, depends on the facts of the particular case. No a priori rules can be formulated to meet the exigencies of each case. Thus, we reject the Solicitor's contention that testing, presumably in or closely simulating the intended environment, is an *absolute* requirement when the inventor's aim is to produce a new product superior to a then-existing product."

3. SAME—SAME—SAME—SAME—PROOF OF DISCLOSED UTILITY.

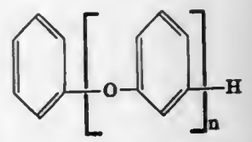
"The evidence necessary to prove a particular utility depends, inter alia, on the nature of the invention sought to be patented. In this case, the utility sought to be proved is that the claimed compounds are suitable as high-temperature functional fluids. This utility, though not specified in the claims, is mentioned in appellants' specification and was contemplated by applicants at the time of their alleged reduction to practice prior to the filing date of Diamond. Thus, the ultimate issue in this case is whether or not the evidence is such that one of ordinary skill in the art would be satisfied to a reasonable certainty that the subject matter necessary to antedate the reference possessed the alleged utility. Stated in this manner, testing is not an arbitrary requirement but is merely one form of evidence relevant to the issue of proof of utility. If testing of the kind insisted on here is found to be a requirement in a particular case, it is because one of ordinary skill in the art would not otherwise be satisfied to a reasonable certainty that the subject matter in question possessed the requisite utility."

APPEAL from the Patent Office. Serial No. 766,685.

REVERSED.

John D. Upham for appellants.

Joseph Schimmel (*Jack E. Armore* of counsel) for the Commissioner of Patents.



Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, JR., *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK, *United States Senior District Judge for the Eastern District of Pennsylvania*

ALMOND, *J.*, delivered the opinion of the court.

This is an appeal from the decision of the Patent Office Board of Appeals affirming the rejection of claims 1, 3–10 and 12–17 in appellants' application Serial No. 766,685, filed October 13, 1958, entitled "Functional Fluid Compositions." Appellants have withdrawn the appeal as to claims 7, 9, 10, and 13–17, leaving claims 1, 3–6, and 12 for our consideration.

Claim 1 is generic and reads as follows:

1. A meta-linked, unsubstituted poly(m-oxyphenylene)benzene defined by the structural formula

wherein *n* is an integer of at least 3, and mixtures of the aforesaid poly(m-oxyphenylene)benzenes.

Claims 3–6 define species encompassed by claim 1, while claim 12 defines unsubstituted poly(m-oxyphenylene)benzenes having the structural formula set forth in claim 1 where *n* is an integer from 3 to 6. Like claim 1, claim 12 also includes mixtures of compounds of the structure set forth in the respective claims.

According to appellants' specification, the claimed compounds are high-temperature functional fluids suitable for use as synthetic lubricants for jet engines, hydraulic fluids for supersonic aircraft and missiles, and coolants for electronic equipment.

The claims stand rejected as being fully met by Diamond, United States Patent No. 2,940,929, filed June 26, 1958, and issued June 14, 1960.

Diamond relates to lubricating compositions especially designed for use at elevated temperatures and under oxidizing conditions. The compositions comprise broadly:

* * * a major proportion of polyphenyl ethers and minor proportions sufficient to stabilize said ethers against oxidation at temperatures in excess of about

450° F., said additive material being basic and neutral indium salts of fatty acids, thiafatty acids, and of alkylated benzoic acids * * *.

The polyphenyl ethers may have from 3 to 8 phenyl radicals per molecule. The phenyl radicals may be substituted with either a tertiary butyl or alpha-cumyl radical or unsubstituted. Diamond specifically discloses bis(m-phenoxyphenyl) ether and m-bis(m-phenoxyphenoxy)benzene, the compounds of appealed claims 3 and 4, respectively. Diamond also contemplates mixtures of unsubstituted and substituted polyethers. Further discussion of Diamond with regard to mixtures will be undertaken, infra.

In an effort to overcome Diamond, appellants submitted two series of affidavits under Rule 131, one series by Hammann and the other by Blake, the joint applicants in the case at bar. The corresponding affidavits of the joint applicants are substantially identical. The Hammann affidavits of April 16, 1962, and February 4, 1963, and the Blake affidavits of April 17, 1962, and February 7, 1963, were filed prior to the original decision of the Board of Appeals on March 31, 1964.

The affidavits of April 16 and April 17, 1962, accompanied by Exhibits I and II, allege that "certain subject matter of the above-identified application was conceived and reduced to practice in this country prior to or under a U.S. Government contract for the 'Development of High Temperature Base Stock for Hydraulic Fluids and Lubricants' prior to June 26, 1958"; that Exhibits I and II are copies of portions from Hammann's research notebooks; that Exhibits I and II show, respectively, the preparation of bis(m-phenoxyphenyl) ether and m-bis(m-phenoxyphenoxy)benzene; that both compositions "were observed to be colorless fluids at room temperature useful as functional fluids"; and that a progress report completed prior to June 26, 1958, indicated that a major manufacturer of jet engines has a great interest in the all-meta unsubstituted aromatic ethers, wherefore the above compositions were synthesized in an attempt to reduce prospective costs.

The Examiner criticized the foregoing affidavits stating that the exihits "are not legible and therefore should be accompanied by typewritten copies." In response to this objection, supplemental affidavits were filed February 4 and February 7, 1963, accompanied by typewritten copies of Exhibits I and II.

The supplemental affidavits contain the following averments:

Deponent [Blake] further states that the products of Exhibits I and II were evaluated prior to June 26, 1958, under his and/or Dr. William C. Hammann's direction and/or supervision for thermal decomposition points * * * and for viscosity in centistokes (cs.) at several temperatures, with the following results:

Exhibit I.—The bis(m-phenoxyphenyl) ether * * * sample was found to be a light-yellow colored liquid having a refractive index (n_D^{25}) of 1.6194, a thermal decomposition point above 700° F. and a viscosity respectively at 100°, 210°, 400° and 700° F. of 67.708, 6.29, 1.37, and 0.473 centistokes. The sample was observed to still be a liquid after storage for more than one (1) year.

Exhibit II.—The m-bis(m-phenoxyphenoxy)benzene * * * sample was found to be a colorless liquid having a refractive index (n_D^{25}) of 1.6300, a thermal decomposition point of 792° F. and a viscosity respectively at 100°, 210° and 400° F. of 343.62, 12.948 and 2.087 centistokes.

The Examiner held that the foregoing affidavits were insufficient to overcome Diamond for the following reasons:

(1) The affidavits and exhibits are limited to 2 species, however, as previously noted the Diamond reference discloses a range of polyphenyl ethers and the instant claims are directed to more than 2 species.

(2) The said affidavits do not cover the mixtures of polyphenyl ethers as disclosed in Diamond and instantly claimed.

(3) The affidavits do not contain an adequate showing of utility of the compounds. It is not evident how the mere disclosure of properties for the two species disclosed in the affidavits establishes utility as functional fluids. It is clear from *Wilkinson et al.*, 1962 C.D. 689, that an adequate showing of utility is necessary in an affidavit under Rule 131 and particularly when, as in the instant case, the reference discloses utility for the compounds.

The Board made the following holdings with regard to the three reasons advanced by the Examiner:

The first point raised by the Examiner is clearly not applicable to claims 3 and 4 which are drawn to the species disclosed in the affidavits and accompanying exhibits. We are further of the opinion that in the instant case the two species prepared by appellants are sufficiently representative of the generic class of compounds claimed to warrant claiming the class. Therefore, we will not sustain point 1.

We will sustain the second point raised by the Examiner. This criticism of the affidavits applies only to those claims drawn to mixtures, namely claims 10, 12, 13, 15, 16 and 17. We deem the limitation to a mixture to be a pertinent limitation disclosed in Diamond. Therefore, the affidavits are insufficient to remove Diamond in that they do not disclose this limitation. * * *

An establishment of utility requires testing the compounds in the specific use for which they are designed or laboratory tests may be made which must simulate actual service conditions with sufficient clearness to render it reasonably certain that the subject matter will perform its intended function in actual service. We do not consider that merely determining the thermal decomposition points and viscosity at certain temperatures of two of the compounds claimed constitutes such tests as to warrant the conclusion that there has been a reduction to practice of the subject matter claimed for the purposes in view. * * * We further fail to find in the affidavits submitted any factual evidence to show that the thermal decomposition points and viscosities mentioned were actually determined prior to the filing date of the Diamond patent. * * *

Subsequent to the Board's decision, and coincident with the filing of a petition for rehearing, appellants filed supplemental affidavits apparently in response to the Board's statement that factual evidence was lacking that the data in the earlier filed affidavits was obtained prior to Diamond's filing date.

In disposing of the petition, the Board adhered to its original decision without commenting on the newly filed affidavits.

[1] The Solicitor urges this court not to consider the affidavits filed subsequent to the Board's decision. Under the facts of this case, we are unable to agree with the Solicitor. The affidavits filed subsequent to the Board's decision did not contain any additional material averments or factual evidence. Rather, the affidavits consisted of original compilation sheets on which was written the data recited in the earlier affidavits. Thus, the Board was not faced with the task of considering evidence which had not been considered by the Examiner and by the Board itself in its original decision. Moreover, at no time did the Examiner criticize the affidavits for their lack of showing that the data was not obtained prior to Diamond's filing date. This matter was raised for the first time by the Board. Additionally, the earlier filed affidavits contained averments that the data set forth therein was obtained prior to Diamond's filing date.

As to the merits of the utility requirement in the affidavits, it was the Board's view that testing of the claimed compounds, either in the specific environment for which they were designed or under laboratory conditions sufficiently simulating such environment, was necessary to establish utility and that determining thermal decomposition points and viscosity at certain temperatures did not suffice.

Appellants agree with the Board to the extent that a showing of utility is necessary when, as here, the reference discloses a utility for the subject matter being used to reject the claims. It is appellants' position, however, that the information known to the inventors concerning the claimed compounds was sufficient to make their utility obvious to themselves and others having ordinary skill in the functional fluid art.

[2] This court has made it clear that whether or not testing of an invention is required to establish utility, and if so, the nature and extent of such testing, depends on the facts of the particular case. No a priori rules can be formulated to meet the exigencies of each case. Thus, we reject the Solicitor's contention that testing, presumably in or closely simulating the intended environment, is an *absolute* requirement when the inventor's aim is to produce a new product superior to a then-existing product.

[3] The evidence necessary to prove a particular utility depends, inter alia, on the nature of the invention sought to be patented. In this case, the utility sought to be proved is that the claimed compounds are suitable as high-temperature functional fluids. This utility, though not specified in the claims, is mentioned in appellants' specification and was contemplated by applicants at the time of their alleged reduction to practice prior to the filing date of Diamond. Thus, the ultimate issue in this case is whether or not the evidence is such that one of ordinary skill in the art would be satisfied to a reasonable certainty that the subject matter necessary to antedate the reference possessed the alleged utility. Stated in this manner, testing is not an arbitrary requirement but is merely one form of evidence relevant to the issue of proof of utility. If testing of the kind insisted on here is found to be a requirement in a particular case, it is because one of ordinary skill in the art would not otherwise be satisfied to a reasonable certainty that the subject matter in question possessed the requisite utility.

As we stated above, the utility which appellants must establish is that their claimed compounds are suitable as high-temperature functional fluids. With regard to such utility, appellants' specification states:

> The present critical requirements for high-temperature functional fluids are extremely restrictive. Thus, the functional fluid may be required as a synthetic lubricant for jet engines, as a hydraulic fluid for supersonic aircraft and missiles, as coolants for electronic equipment, etc., wherein the fluid is often required to function at extreme temperature ranges up to 800° F. and higher and down to normal atmospheric temperatures. These requirements pose the very difficult problem of finding suitable compositions which are thermally stable at the very high temperatures, but are still fluid at the lower temperatures. The fluids must also possess adequate temperature-viscosity properties and suitable lubricity, i.e., the fluids must not get too thin at the very high temperatures and/or too thick at the lower temperatures, and must possess adequate lubricating characteristics over the range of temperatures to which the system is subjected.

In addition to the characteristics for functional fluids set forth in the foregoing portion of appellants' specification, it is also stated that functional fluids must be "substantially free from corrosive action." With these characteristics in mind, we now turn to an analysis of the evidence of record bearing on the issue of utility.

First to consider is the requirement that the composition be liquid at low temperatures. This requirement appears met by the fact that the compounds bis(m-phenoxyphenyl) ether and m-bis(phenoxyphenoxy)benzene were observed to be colorless oils at room temperature as is demonstrated by the fact that their refractive indices could be and were measured at 25° C. (n_D^{25}) of 1.6194 and 1.6300, respectively. As to the latter compound, further evidence on this point is supplied by the fact that its pour point was determined to be about 50° F.

The second requirement concerns the thermal stability of the composition at elevated temperatures. We believe this requirement is met by the fact that the thermal decomposition points for bis(m-phenoxyphenyl) ether and m-bis(m-phenoxyphenoxy)benzene were measured and determined to be above 700° F. for the former and 792° F. for the latter.

The third requirement is that the composition must have adequate temperature-viscosity and lubricity properties. We think this requirement is also met as to both compounds in question. As to bis-(m-phenoxyphenyl) ether, the viscosity at 100° F., 210° F., 400° F. and 700° F. was measured and determined to be, respectively, 67.708, 6.29, 1.37, and 0.473 centistokes. As to m-bis(m-phenoxyphenoxy) benzene, the viscosity at 100° F., 210° F., and 400° F. was measured and determined to be, respectively, 343.62, 12.948, and 2.087 centistokes. The Patent Office has not challenged the adequacy of this data to establish the requisite lubricity and viscosity-temperature properties for high-temperature functional fluids, and we perceive no reason to do so.

The fourth requirement is that the composition must be noncorrosive. While the Rule 131 affidavits are silent as to this specific property, there is of record several pages of the text Kirk and Othmer, Encyclopedia of Chemical Technology (1957). Pages 392 and 557–569 of this text were presented to the Board and the Solicitor has expressly indicated no objection to their consideration in this appeal. On page 392, there appears the following:

> *Dowtherm A* (see *diphenyl; phenolic ethers*) is a trade-marked name for a eutectic mixture of 73.5% diphenyl ether (diphenyl oxide) and 26.5% diphenyl (biphenyl). The mixture solidifies at 54° F.; the recommended working range is 450–725° F. Since decomposition at higher temperature levels is by thermal cracking, the rate of decomposition is dependent on temperature; the equipment should therefore be properly designed so that excessive film temperatures will not be encountered.
>
> Dowtherm A is noncorrosive, and therefore equipment for its use may be fabricated of carbon steel. * * *

With regard to this passage from the encyclopedia, appellants' state:

> Appellants also submit that lower polyphenyl ethers which are outside the scope of their invention and claims, e.g. wherein *n* in appellants' generic formula * * * would be 1, have long been known to those skilled in the art as the principal component of the heat-transfer fluid sold under the trademark "Dowtherm A." This commercial functional fluid product is a eutectic mixture of approximately 75% diphenyl ether and 25% of biphenyl, is a noncorrosive fluid solidifying at about 54° F. and is employed over a working range of from about 450° to 725° F., i.e., the chemical structure of the benzenoid rings joined through an ether linkage was known to have a high degree of thermal stability and to be relatively chemically inert prior to appellants' invention. * * *

We see no reason to doubt appellants' assertions on this point; certainly the Patent Office has not provided us with any reason. Appellants' compositions do not contain any different functional groups

from those present in "Dowtherm A." This closeness in structure is, in our view, persuasive that one of ordinary skill in the art would be satisfied to a reasonable certainty that the claimed compositions were noncorrosive.

From the foregoing, we think it clear that sufficient evidence was presented to satisfy one of ordinary skill in the art to a reasonable certainty that the subject matter necessary to antedate the Diamond reference (here the compositions of claims 3 and 4) possessed the alleged utility.

There remains for consideration the Board's decision affirming the rejection of claims drawn to mixtures of polyphenyl ethers. Initially, there is a dispute as to whether the Board's decision applied to appealed claims 1 and 12 or merely to claim 12. This dispute arises because the Board failed to mention claim 1 in passing on the issue regarding mixtures. However, the Examiner's answer clearly stated that this aspect of the rejection applied, inter alia, to claims 1 and 12.

With regard to mixtures, Diamond states:

> The unsubstituted polyphenyl ethers have been found to be outstandingly stable but may be improved in their operating life at temperatures above 400° F. by the presence of the subject classes of additives as described herein. However, the major use of the present invention is with respect to the two other types of polyphenyl ethers, namely, those containing tertiary butyl substituents, alpha-cumyl substituents or both. Mixtures of the unsubstituted polyphenyl ethers with the tertiary butyl or alpha-cumyl substituted ethers is contemplated.

As to the purpose for utilizing mixtures of substituted and unsubstituted polyethers, Diamond states:

> When utilizing mixtures of unsubstituted polyphenyl ethers with the tertiary butyl or alpha-cumyl substituted polyphenyl ethers, it is preferred that the composition contain from 10 to 90% of unsubstituted ethers containing 2–6 phenyl radicals per molecule together with 90–10% by weight based on the total composition of the substituted polyphenyl ethers as defined above. The principal function of the unsubstituted polyphenyl ethers is to enhance the outstanding high-temperature stability which this class of compounds has been found to exhibit. The substituted polyphenyl ethers as outlined above impart low melting points and in mixture with the unsubstituted polyphenyl ethers causes the melting point of the entire composition to be substantially lower than that of the unsubstituted polyphenyl ethers themselves.

The above-quoted passages from Diamond amply support appellants' contention that "* * * Diamond does not disclose mixtures restricted to the unsubstituted all-meta linked polyphenyl ethers," as called for by appealed claims 1 and 12. Thus, it was unnecessary for appellants to show mixtures of their claimed polyethers in a Rule 131 affidavit. *In re Stempel*, 44 CCPA 820, 241 F.2d 755, 113 USPQ 77.

The Board's decision is reversed.

REVERSED.

3 Claims. (Cl. 2—12)

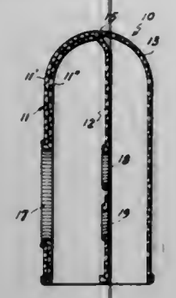
1. A plurality of nesting, flat-cut one piece flexible sun visors consisting of the same material and each comprising in their flat position a wide eye-shading front piece having a front edge in the shape of a flattened curve having a width adapted to be wider than the forehead of the intended wearer, said front piece having narrower backwardly extending outwardly flaring arms, suitable for attachment to each other and sufficiently long to overlap at the back of the head of the wearer, the inside edge of the arms of each surmounting sun visor conforming to the outside edge of the next adjacent sun visor.

3,271,779
METHOD OF MAKING AN UNDERCOLLAR
John P. Dougherty, Teaneck, N.J., assignor to Monsanto Company, a corporation of Delaware
Filed Dec. 16, 1963, Ser. No. 330,969
1 Claim. (Cl. 2—98)

A method for manufacturing an undercollar for maintaining the shape of a deformable material in a collar comprising the steps of:

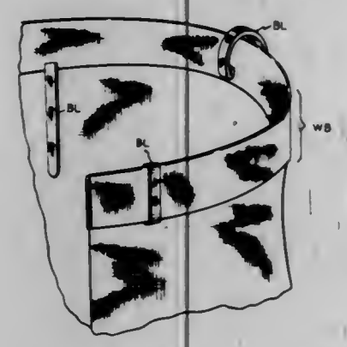
(a) placing battings composed of a plurality of loose fibers disposed in a randomly oriented relationship on both faces of a foundation scrim composed of interlocking fibers formed in a web;
(b) needle-punching said battings into said web thereby locking said battings to said web and forming a coherent non-woven fabric;
(c) fusing said fibers together at their points of contact by subjecting said non-woven fabric to a bonding agent which is a solvent to the fibers of said batting and said scrim;
(d) drying and curing said bonded, non-woven fabric;
(e) subjecting said fabric to desired textile finishing operations; and
(f) cutting undercollars to desired dimensions from said fabric by die stamping.

3,271,780
TIE LOCATING DEVICE
Edgar K. De Jean, 102 N. Harrison, Salem, Ind.
Filed Oct. 22, 1964, Ser. No. 405,655
3 Claims. (Cl. 2—146)



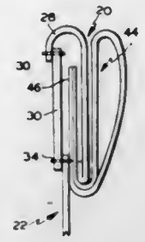
3. The method of providing for a customized fitting of a necktie comprising the steps of mounting an elongated strip on the undersurface of one end of the tie, aligning a predetermined point on the strip with a predetermined extrinsic point, tying the tie in the conventional manner, comparing the length of the tie ends, untying the tie and repeating the above steps, utilizing a vertically adjusted point on the strip, if necessary, until the larger end of the tie is of the same length as or slightly longer than the small end of the tie, and providing an indelible mark on the strip at the last used predetermined point thereon.

3,271,781
CAP CONSTRUCTION
Sheldon Sontag, Brooklyn, and Albert B. Peck, Tarrytown, N.Y., assignors to Peck Manufacturing Company, Inc., New York, N.Y., a corporation of New York
Filed Apr. 15, 1965, Ser. No. 448,293
13 Claims. (Cl. 2—202)



1. A convertible head covering comprising first and second superposed panel members forming a tubular body portion, a third panel member disposed intermediate said first and second panel members and selectively disposable in abutting facing relationship with either of said first and second panel members, said first panel member hav-

ing a relatively large face opening therein for exposing a substantial portion of the wearer's face when disposed in overlying abutting facing relation therewith and one of said remaining panel members having at least one

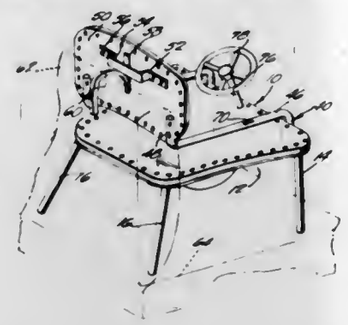


aperture which is small in relation to said face opening in said first panel member for effecting selective and limited exposure of at least one facial element when said last mentioned panel member is disposed in overlying abutting facing relation with the wearer's face.

3,271,782
TROUSER WAISTBAND CONSTRUCTION
Charles R. Mallett, Box 483, Raceland, La.
Filed Jan. 21, 1964, Ser. No. 339,305
5 Claims. (Cl. 2—236)

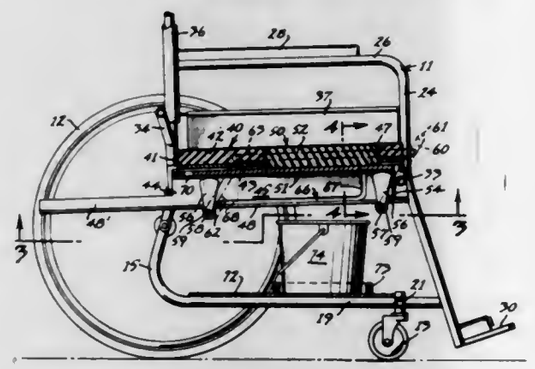
1. Trousers that can be used with or without a belt comprising in combination:
(a) a waistband section around the uppermost portion of said trousers,
(b) said waistband section being defined by at least two layers of material,
(c) said two layers of material being joined together along upper and lower circumferential lines that are vertically spaced apart,
(d) said two layers forming a space therebetween having a substantial vertical height,
(e) a plurality of openings located at spaced intervals adjacent said lower circumferential line which provides access from the exterior of said trousers into said space,
(f) a plurality of narrow elongated belt loops disposed around the top of said trousers,
(g) the inner end of each belt loop being attached to spaced apart points interior of said openings around the upper interior portion of said trousers,
(h) the outer end of each belt loop being loose and being movable from the interior side to the exterior side of the trousers,
(i) said outer end of each belt loop having sufficient length and rigidity so that it can be inserted through one of said openings into said space.

3,271,783
TROUSER AND BELT LOOP ARRANGEMENT
Charles R. Mallett, P.O. Box 483, Raceland, La., and Coy F. Glenn, P.O. Box 58, Amory, Miss.
Filed Mar. 30, 1964, Ser. No. 355,591
2 Claims. (Cl. 2—236)

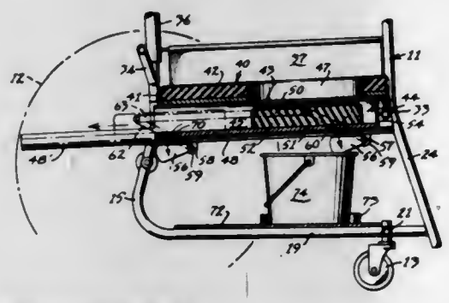


1. Trousers that can be used both with and without a belt comprising in combination:
(a) a waistband section secured to the uppermost portion of said trousers, said waistband section being defined by at least two layers of material,
(b) the lower circumferential portion of said waistband section being joined to the upper edge portion of the main body of the trouser material by stitching that is disposed along a generally circumferential seam line,
(c) the circumferential seam line holding the lower edge of the outermost layer of said waistband in place being interrupted at spaced apart intervals thus providing a plurality of exteriorly accessible openings,
(d) said openings being wide enough to accommodate a belt loop member,
(e) a plurality of removable belt loop members located at spaced intervals around said waistband section,
(f) said belt loop members being associated with the waistband section in a non-permanent manner so that each belt loop can be associated with and removed from said waistband section in a matter of seconds,
(g) each belt loop member comprising (1) a closed loop portion consisting solely of layers of textile material and (2) an elongated stiff portion attached to said closed loop portion,
(h) the elongated stiff portions of said belt loops extending inwardly and upwardly through said plurality of exteriorly accessible openings so that they remain positioned under the outer layer of cloth forming said waistband section,
(i) the closed loop portions of said belt loops extending upwardly from said exteriorly accessible openings on the outside of said waistband in a position generally parallel to said elongated stiff portions and separated therefrom by the outer layer of cloth forming said waistband.

3,271,784
CONVERTIBLE COMMODE CHAIR
Geneat Medley Harvey Peffley, Rte. 2, Covington, Ohio
Filed May 13, 1964, Ser. No. 367,014
1 Claim. (Cl. 4—134)

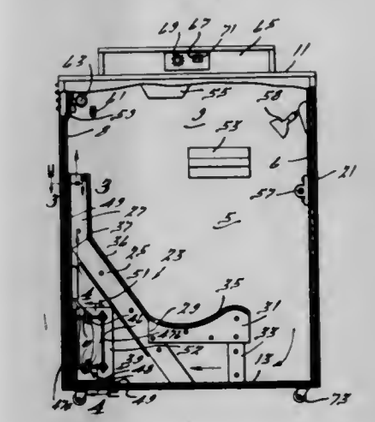


In a chair including a pair of front legs, a pair of rear legs, and a horizontally disposed seat panel having spaced parallel side edges, said panel extending over the adjacent ends of said front and rear legs, said seat panel having an opening centrally thereof, there being a recess extending about said opening and the upper face of said seat panel, a toilet seat seated in said recess, said toilet seat having an opening therethrough, means embodying a sheet of metal shaped to form a bowl receiving socket, said sheet depending from said seat panel and adapted to support an opened top toilet bowl below said opening, a seat and seat cover conformably shaped to said seat panel normally

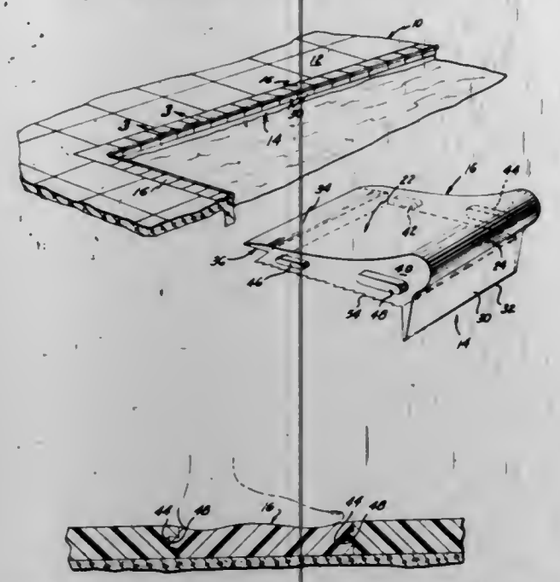


resting upon and hingedly engaged to swing upward of said seat panel and in covering relation wtih respect to said toilet seat and clippingly engaged to be secured to said seat panel, a horizontally disposed U-shaped support disposed adjacent each of said seat panel side edges, one leg of said support being secured to the underside of said panel and the free end portion of the other leg of said support extending vertically, a seat back secured to said

other leg free end portions, a strap member bent to have an offset midportion secured by the end portions thereof to one face of said seat back so that the offset portion with the adjacent portion of said seat back one face forms a slot, an inverted U-shaped hanger element adapted to be disposed in straddling relation with respect to the upper end portion of an automobile seat, and an upright bar connected to one leg of said element, said bar being insertable into and withdrawable from said slot.



3,271,785
CONVERTIBLE WHEEL CHAIR AND COMMODE
Robert F. Du Bose, 611 Ronnie Road, Madison, Tenn.
Filed Dec. 30, 1964, Ser. No. 422,306
3 Claims. (Cl. 4—134)

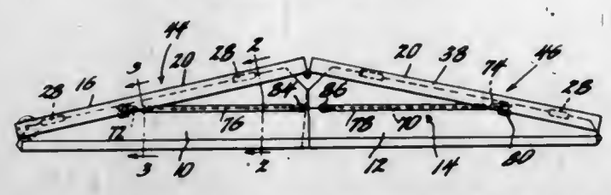


1. A chair comprising:
(a) a frame having a front and a rear,
(b) a primary seat member fixed in said frame,
(c) said primary seat member having an opening therethrough,
(d) a secondary seat member comprising a base and a plug mounted on said base,
(e) said plug being adapted to fill said opening flush with said primary seat member when said secondary seat member is in raised closed position,
(f) a pair of elongated runners mounted on said frame spaced beneath said primary seat member and on opposite sides of said opening for slidably supporting said base for longitudinal movement between a first lowered position within the vertical projection of and beneath said opening and a second lowered inoperative position behind and removed from said vertical projection, said plug being beneath said primary seat member in said first lowered position and during its longitudinal movement therefrom,
(g) cam means for engaging said base to vertically move said secondary seat member between said first lowered position and said raised position,
(h) first handle means operatively connected to said cam means and accessible to an occupant of said chair for operating said cam means,
(i) second handle means operatively fixed to said base for moving said secondary seat member longitudinally of said runners between said first lowered position and said second lowered position,
(j) a receptacle having an open top, and
(k) means mounted on said frame for supporting said receptacle in vertical alignment with said opening so that said top is beneath the plane of said runners.

3,271,786
PORTABLE SAUNA CABINET
William M. Joy, 1615 N. River Road, St. Clair, Mich.
Filed Feb. 7, 1964, Ser. No. 343,286
12 Claims. (Cl. 4—160)

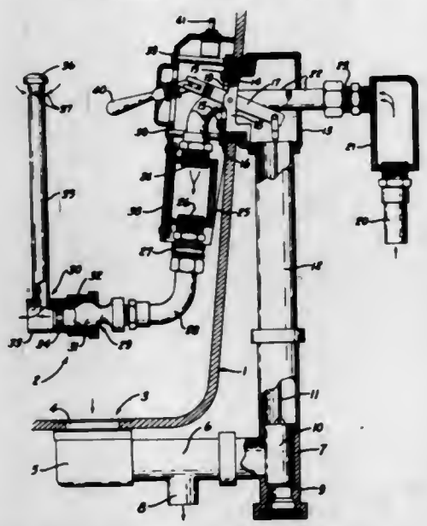
1. A portable, self-contained heating cabinet for the therapeutic treatment of a human comprising:
a plurality of wall members defining an interior chamber within said cabinet assembly,
means for supporting a human within the interior chamber,
vertical means supported spaced from one of said walls and cooperating therewith to form a vertical chimney like chamber in pneumatic communication with said interior chamber, and
a heating chamber having electrical heating means contained therein for convection heating air in said heating chamber,
said heating chamber being positioned below said chimney like chamber and in pneumatic communication with both said interior chamber and said chimney like chamber,
establishing a flow of air from said interior chamber, through said heating chamber and through said chimney like chamber.

3,271,787
RESILIENT SWIMMING POOL COPING
Arthur L. Clary, 4 Lewis Drive, San Dimas, Calif.
Filed Apr. 6, 1964, Ser. No. 357,353
10 Claims. (Cl. 4—172)



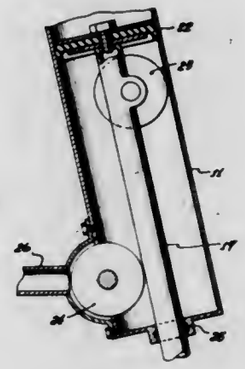
1. Coping for the edge of a swimming pool, said coping comprising a plurality of individual coping blocks formed of a resilient spongy material, said blocks being configured to provide coping along the edge of the pool, each of said blocks having an arcuate upper surface, a rounded front portion adjacent to the pool water and a rear portion tapering rearwardly, and means on the undersides of the respective coping blocks for securing the blocks to the decking structure of the pool edge.

3,271,788
TRACKLESS SWIMMING POOL COVER
Emil A. Bender, P.O. Box 52, Bakersfield, Calif.
Filed June 26, 1964, Ser. No. 378,120
8 Claims. (Cl. 4—172)



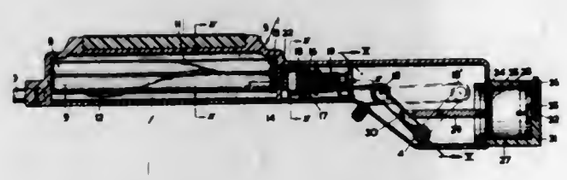
1. In a trackless swimming pool cover system having a series of hingedly connected panels, means on the supporting end of each of the panels, a panel carrier mounted on a wheel arrangement and having the transverse dimension thereof slightly greater than said length dimension of the pool, hook means on the end of said series of panels remote from the panel carrier when the series of panels are in covering position, latch means for being secured to the pool deck about the said pool and for receiving said hook means when it is desired to offload the panels from the carrier as well as for securing firmly an end of the series of panels in place when in their covering position, and a scoop assembly positioned on the forward edge of said carrier and having an inclined surface disposed to engage the panels and to remove the hook means from the latch means when said inclined surface of said scoop assembly makes an overpass of said latch means, said latch means including mounted thereon a roller disposed to rotate about a generally vertical axis; said panel carrier having a lateral edge disposed in a tapered relation for engaging said roller of said latch means for adjusting the alignment of the panel carrier to a corrected position as it engages said roller, and slide bar means to stop the panel carrier in a position adjacent the latch means.

3,271,789
SWIMMING POOL COVER
Emil A. Bender, P.O. Box 52, Bakersfield, Calif.
Filed June 26, 1964, Ser. No. 378,124
5 Claims. (Cl. 4—172)



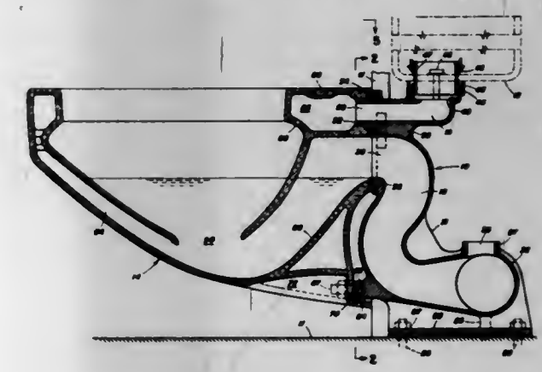
1. A swimming pool cover comprising a plurality of elongated panel members extending transversely of the pool and hingedly connected to each other in accordion-fold arrangement defining alternate hip and valleys when in an extended position, a pair of resilient cables with its ends connecting proximate ends of adjacent panel members, a pair of generally triangularly configured protective shields for each end of said hips and each protective shield of said pair having one side thereof in abutting engagement with the other of said pair, having another side hingedly engaging the ends of the panel members proximate to said resilient cables, and having the remaining side thereof for extending toward the ground for providing substantial contact therewith when the pool cover is in its extended position, a tubular member mounted on each of said protective shields for holding one of said cables in position adjacent said protective shields so that as the panel members are folded from their extended position, the protective shields fold upwardly against the underside of the panel members to allow the pool cover to conform to its closed position.

3,271,790
THERAPEUTIC BATH FLUID CIRCULATING APPARATUS
Richard C. Schneider, 804 NE. 15th Ave., Fort Lauderdale, Fla., and Douglas C. Steltz, 13385 Kenmar Court, Brookfield, Wis.
Continuation of application Ser. No. 307,636, Sept. 9, 1963. This application Aug. 3, 1965, Ser. No. 476,893
7 Claims. (Cl. 4—180)



1. A hydrotherapeutic apparatus, a tub to contain water and having a waste drain opening in the bottom surface and having an opening spaced upwardly of said bottom surface, conduit means connected to the drain opening and communicating with the inlet of a pumping means for conducting water from the tub to said pumping means, a nozzle assembly located within the tank and including a discharge nozzle and having means for mixing air with the water being discharged by said discharge nozzle, and second conduit means providing communication between the outlet of said pumping means and said nozzle assembly, said second conduit means extending through said opening of the tub.

3,271,791
BATHTUB ELEVATING SEAT
Forest M. Sarff, Los Angeles County, Calif. (19109 Newhouse St., Saugus, Calif.)
Filed July 10, 1964, Ser. No. 381,849
2 Claims. (Cl. 4—185)

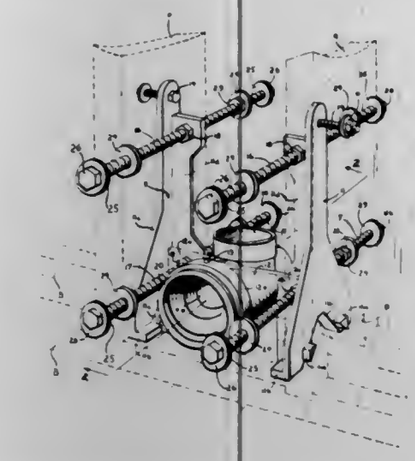


1. An elevating seat for a bathtub including: a pair of cylinders, means to securely hold said cylinders adjacent to said bathub, pistons within said cylinders, movable seals mounted on each piston to seal between each said piston and each said cylinder, piston rods attached at one end to said pistons and at the other end extending outwardly from said cylinders, a roller secured to each piston rod to movably hold said piston a desired distance from said cylinder, a roller secured to the lower inside end of each cylinder to movably hold said piston rod a desired distance from said cylinder, a seal mounted to seal between said cylinder and said piston rod, a seat movably attached to said other outside end of said piston rod, hydraulic power means to move said piston upwardly of said cylinders to raise said seat and means to connect said power means to a source of water and to control said power means.

3,271,792
SANITARY TOILET SEAT
Gerardus Marinus Tromp, 1132 Van Alkemadelaan, The Hague, Netherlands
Filed July 3, 1963, Ser. No. 292,706
7 Claims. (Cl. 4—247)

1. A toilet seat adapted to be pivoted about a substantially horizontal axis between a substantially vertical and a substantially horizontal position relative to a toilet bowl, said seat being formed with two hollow seat cushions, each housing a web of paper, a strip of which being adapted to be drawn over the seat cushion, clamped and cut off on the other side of the seat cushion by a mechanism comprising two rolls, at least one roll being adapted to be rotated by means of the swinging movement of the seat, through a coupling engaging in one rotational direction between the roll and a spindle driven by the swinging movement of the seat, by means of a flexible pull member, one end of which is secured to the body of the seat, the flexible pull member being guided successively over a first sheave having a fixed position relative to the bowl and a second sheave having a fixed position relative to the seat body, the other end of the flexible pull member wound about the spindle and secured thereto, one roll being provided with at least one rib extending substantially the length of the said one roll, the other roll being provided with a groove corresponding with the rib on the said one roll.

3,271,793
BATHROOM STRUCTURE AND FIXTURE
Gilbert McMurtrie and Robert William Nagel, Louisville, Ky., and Edward Walter Forth, New Canaan, Conn., assignors to American Radiator & Standard Sanitary Corporation, New York, N.Y., a corporation of Delaware
Filed July 22, 1963, Ser. No. 296,571
2 Claims. (Cl. 4—252)



1. A water closet structure comprising a water closet bowl having a rear end substantially vertical mounting face, said bowl having an upper flushing water inlet opening through the mounting face and a water outlet below said inlet also opening through the mounting face, a carrier bodily supporting said closet bowl close to floor level and having a bottom horizontal mounting plate for rigid attachment to a floor, said carrier being generally upstanding and having an upwardly facing top flange adjacent the top of said bowl for the mounting and support of a flush tank, a generally vertical forward face on said carrier adapted to abut with said rear end mounting face of the bowl, bolt means detachably rigidly interconnecting said bowl and carrier with said faces in abutting relation, said carrier having a substantially horizontal flushing water inlet passage leading from said top flange in direct communication with said upper inlet of the bowl, said carrier having a serpentine syphoning leg immediately rearwardly of the bowl including a top forwardly facing opening in direct communication with said bowl outlet, and a lower end horizontal generally T-shaped discharge head on said carrier including a horizontal transverse sleeve connected at its forward side and near its midpoint with the bottom of the syphoning leg, either end of said sleeve adapted for connection with a soil pipe while the opposite end is suitably closed, said T-shaped head being immediately above the mounting plate of the carrier and adjacent the bottom of the bowl.

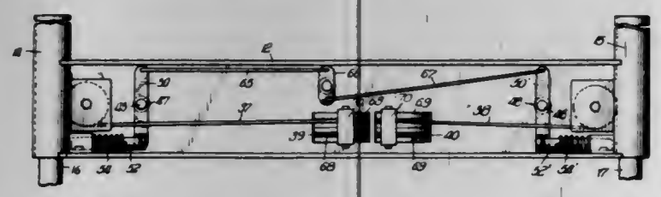
3,271,794
PLUMBING FIXTURE CARRIER

George J. Flegel, Michigan City, Roger L. Mielbeck, La Porte, and Richard D. Dirks, Michigan City, Ind., assignors to Josam Manufacturing Co., Michigan City, Ind., a corporation of Delaware

Filed Jan. 13, 1964, Ser. No. 337,337
13 Claims. (Cl. 4—252)

1. In a carrier structure for support of a plumbing fixture of the wall-hung type and having a discharge connection to a drainage line within a building wall,

a pair of spaced carrier upright members entirely within the wall structure secured to respective spaced vertical parallel surfaces within and supported on horizontally spaced portions within the wall structure;



each upright comprising as an integral structure a vertically extended portion adapted to be secured against a corresponding said vertical surface of the wall structure and having a lower portion widening out to provide at the bottom a widened base for support on horizontal structure within the wall structure, said extended portion having a bolt hole through an upper part thereof for an anchor bolt securing the same to a respective said vertical surface and also having a pair of horizontally spaced lugs projecting from said lower portion outwardly into the wall structure at said respective vertical surface, a second vertically extending portion projecting perpendicularly from the first and having therethrough a vertically spaced pair of apertures;

and fixture mounting stud bolts received in and secured to the uprights at respective said apertures.

3,271,795
HI-LOW FRAME FOR HOSPITAL BED

William A. Hillenbrand, Franklin Township, Francis J. Burst and William D. Drew, Batesville, Ind., assignors to Hill-Rom Company, Inc., Batesville, Ind., a corporation of Indiana

Original application June 15, 1964, Ser. No. 374,974. Divided and this application June 10, 1965, Ser. No. 462,803
7 Claims. (Cl. 5—63)

1. A hospital bed comprising:

(a) a rectangular frame including cross members at the head and foot ends of the frame;

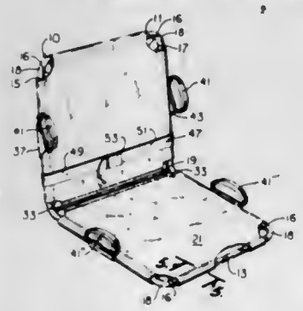
(b) a post fixed on each end of each cross members;

(c) a leg telescoped into each post for supporting the bed upon a floor;

(d) a spring frame supported above said frame and normally disposed parallel thereto;

(e) power means for raising and lowering said posts and frame upon said legs;

(f) a plunger journaled in each post at one end of the frame;



(g) manual means for moving said plungers into slots in the associated legs that are aligned with the plungers when the posts are in elevated positions on the legs;

(h) and means for holding said plungers engaged in the slots while said power means lowers the other end of the frame to move the spring frame downwardly from horizontal into a downwardly inclined position.

3,271,796
STRETCHER CHAIR

Avis M. Dillman, 911 W. 3rd, Indianola, Iowa

Filed June 22, 1964, Ser. No. 376,702
7 Claims. (Cl. 5—82)

1. In a chair for carrying a person in a sitting position,

a frame having elongated spaced apart side members and spaced apart end members extending therebetween,

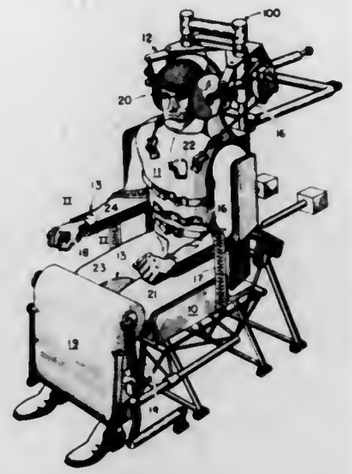
a cross brace secured to and extending between said side members along their length parallel to said end members,

said frame having each of its side members bent adjacent the juncture of said side members with said cross brace to form a substantially U-shaped horizontal frame member and a substantially U-shaped inclined frame member extending upwardly therefrom,

a substantially rectangular cover on said frame having a seat portion with top and bottom surfaces mounted on said horizontal frame members and having a back portion with front and back surfaces mounted on said inclined frame member,

a first strap secured to the bottom surface of said seat portion adjacent one side thereof extending diagonally thereacross and thence diagonally upwardly of said back portion; said first strap having its upper end extending outwardly of one of said side members at a point between said cross brace and one of said end members,

a second strap secured to the bottom surface of said seat portion adjacent the other side thereof extending diagonally thereacross and thence diagonally upwardly across the back surface of said back portion; said second strap having its upper end extending outwardly of the other side member at a point between said cross brace and said one of said end members,



a third strap secured to and extending across the bottom surface of said seat portion between said cross brace and the other end member and parallel thereto; said third strap having each of its ends extending outwardly of said side members,

and a handle means secured to the upper ends of each of said first and second straps and to each of the ends of said third strap.

3,271,797
IMPACT PROTECTIVE DEVICE

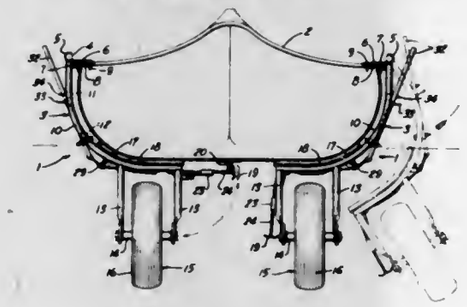
William C. Boyce, Dallas, Tex., assignor to Ling-Temco-Vought, Inc., Dallas, Tex., a corporation of Delaware

Filed Dec. 6, 1962, Ser. No. 242,824
7 Claims. (Cl. 5—348)

1. A pad comprising:

an open-celled, foamed, flexible, plastic body having first and second faces connected by edge surfaces;

a rigid, fluid-impervious backing covering and bonded to substantially all the area of the foamed body first face;



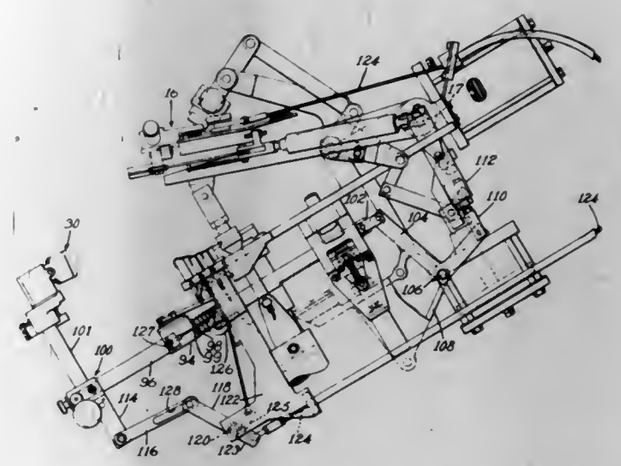
a pliable, fluid-impervious skin covering and bonded to substantially all the area of the foamed body second face and edge surfaces and sealingly attached to the fluid-impervious material to form therewith a fluid-impervious enclosure containing the foamed body;

and a liquid filling the foamed body.

3,271,798
DEVICE FOR LAUNCHING, LANDING AND PORTAGING A BOAT

Max A. Zoretic, P.O. Box 23, Ely, Minn.

Filed Aug. 6, 1964, Ser. No. 387,948
8 Claims. (Cl. 9—1)



1. In combination with a boat having a keel strip disposed adjacent the longitudinal centerline of the hull, a wheel assembly to be attached to the boat to aid in launching, landing and transporting the boat, said wheel assembly comprising a supporting frame pivotally attached to and extending downwardly from the gunwale of the boat along the hull and the lower end of said supporting frame extending inwardly beneath the hull toward the longitudinal centerline of the hull, wheel means carried by the lower end of the supporting frame and located in a vertical plane between a vertical plane passing through said centerline and the vertical plane passing through said gunwale, and locking means extending laterally from the wheel means toward said centerline and disposed to engage the keel strip on said boat.

3,271,799
ADHESIVE ACTIVATOR FOR SHOE LASTING MACHINES

Arthur R. Hubbard, Beverly, Mass., assignor to United Shoe Machinery Corporation, Boston, Mass., a corporation of New Jersey

Filed June 9, 1965, Ser. No. 462,602
14 Claims. (Cl. 12—12)

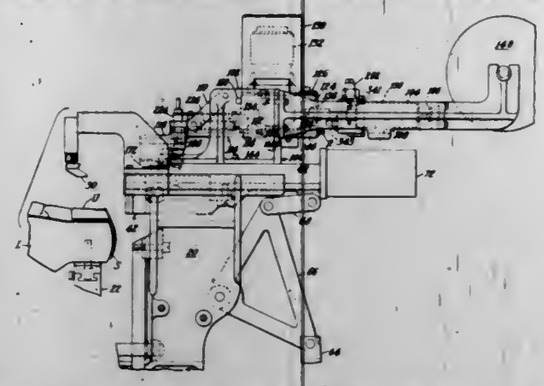
1. In a shoe lasting machine having wipers arranged to wipe the margin of an upper on a last inwardly over the bottom of an insole coated with heat activatable adhesive for securing the upper margin to the insole bottom at the ball region of a shoe,

a support for the shoe including a member engagable with the forepart of the insole, and

means for heat activating the adhesive at marginal portions of the insole bottom at opposite sides of the ball region comprising,

substantially continuous heated surfaces arranged to engage said marginal portions at opposite sides widthwise of the insole, said surfaces each being formed by flexible plates having overlapping ends and disposed to conform substantially to the lengthwise contour of the ball region of the insole bottom,

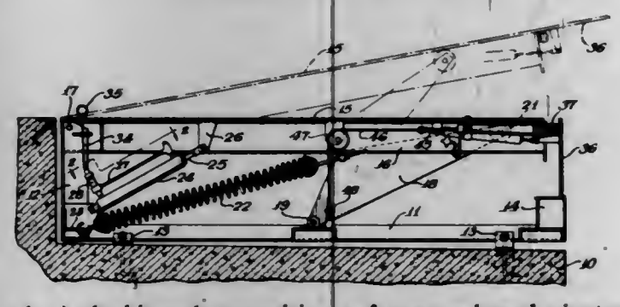
and means carrying each of said plates for movement lengthwise of the shoe into greater or lesser overlapping relationship and relative to the toe end of the ball region for extending and shortening said surfaces according to the size of said shoe.



3,271,800
SHOE MACHINES

Jules N. Allard, Tyngsboro, Mass., assignor to United Shoe Machinery Corporation, Boston, Mass., a corporation of New Jersey

Filed May 25, 1965, Ser. No. 458,616
15 Claims. (Cl. 12—12.5)



13. In a shoe machine having means for supporting a shoe comprising a last with an insole and upper materials assembled thereon, in an inclined position with its toe end lowermost, a molding band, wipers and power operated mechanism for actuating said band and wipers, means for applying adhesive to the heel end of an insole of a shoe on the supporting means, said means comprising a U-shaped nozzle having an operating surface formed with a U-shaped groove, said nozzle being disposed with its operating surfaces substantially parallel to, and being movable into contact with, the heel end of the insole of a shoe on the supporting means with the ends of its groove lower-

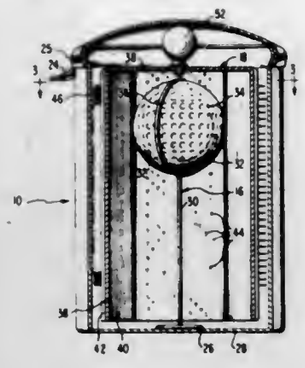
most, means for extruding adhesive into the groove and thence onto the heel end of the insole of the shoe while the nozzle is in contact therewith, and means associated

with each end of the groove in the nozzle for collecting and retaining adhesive not withdrawn from the groove and applied to the insole.

3,271,801
DOCKBOARD
Donald P. Dieter, Chicago, and Harris P. Moyer, Deerfield, Ill., assignors to Unarco Industries, Inc., Chicago, Ill., a corporation of Illinois
Filed Dec. 3, 1963, Ser. No. 327,755
5 Claims. (Cl. 14—71)

1. A dockboard comprising a frame, a board pivoted at one end on a horizontal axis to the frame, resilient means urging the other end of the board upwardly, a lip pivoted to the other end of the board to move from a dependent position to a raised position forming an extension of the board, a first extensible hydraulic unit connecting the lip and the board to raise the lip when the unit is extended, a second hydraulic unit including relatively movable parts, a fluid connection from the first hydraulic unit to the second hydraulic unit, means connecting the parts of the second hydraulic unit respectively to the board and the frame so that the second hydraulic unit will be operated by raising of the board to force fluid from the second unit through the fluid connection into the first unit to extend it, a check valve in the fluid connection opening toward the first unit, and manual means to open the check valve to permit flow of fluid from the first unit to the second unit.

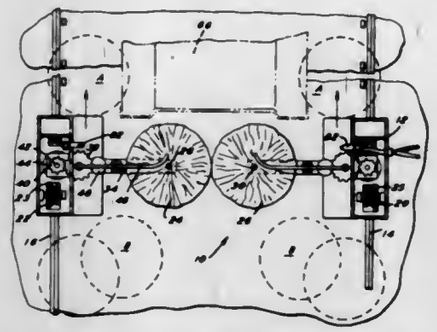
3,271,802
GOLF BALL WASHER
Woodrow F. Thompson, Highway 80 W., Forest, Miss.
Filed July 30, 1965, Ser. No. 475,967
13 Claims. (Cl. 15—21)



1. A portable golf equipment cleaning unit comprising:

(a) a casing having an inner surface;

(b) a golf ball holding means disposed in said casing at approximately the center thereof, and adapted to loosely hold a golf ball;



(c) means for holding a plurality of golf ball cleaning bristles disposed in said casing around said golf ball holding implement;

(d) means allowing relative reciprocating movement between said golf ball cleaning bristle holding means and said golf ball holding means, whereby said bristles will clean a golf ball held in said holding implement; and

(e) a plurality of auxiliary cleaning bristles secured to one of said relatively reciprocable means for cleaning golf shoes, golf clubs, golf bags or other golfing equipment.

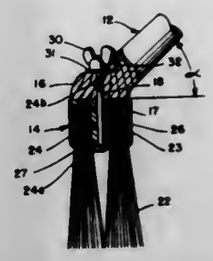
3,271,803
VEHICLE WASHING APPARATUS
John F. Cirino, Churchville, and Charles Brenner, Overbrook Hills, Pa., assignors to Universal Robot Inc., Bala Cynwyd, Pa., a corporation of Pennsylvania
Filed Oct. 11, 1965, Ser. No. 494,452
7 Claims. (Cl. 15—21)

7. Apparatus for washing a vehicle comprising a reciprocatory substantially U-shaped housing, a pair of arms mounted on each of the legs of said U-shaped housing for oscillation about a vertical axis, a rotatable brush mounted on each of said pairs of arms for rotation about a vertical axis, means biasing said pairs of arms toward each other so that said rotatable brushes are in engagement with a vehicle, motor means for oscillating said arms to a position wherein said brushes are out of engagement with the vehicle, and position responsive means carried by said housing for actuating said motor means.

3,271,804
SPONGE MOP AND WRINGER
Raymond C. Tillinghast, Memphis, Tenn., assignor to Gem, Incorporated, Byhalia, Miss., a corporation of Mississippi
Filed Apr. 26, 1965, Ser. No. 450,646
2 Claims. (Cl. 15—119)

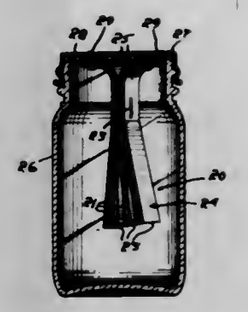
2. In a mop, a pair of plates hingedly connected together, a spring member operatively connected to said plates for urging said plates into coplanar position, sponges affixed to said plates, a curved connector secured to one of said plates, a shaft connected to said connector, a bracket

connected to the other of said plates, a lever pivotally connected to said bracket and said lever having an inclined cam surface, a manually movable slide slidably mounted on said shaft, a pin connected to said slide for selective



engagement with said lever cam surface, said lever having a rounded shouldered end portion, and said shaft having an indented recess portion for selectively receiving said shouldered portion.

3,271,805
TOOTHBRUSH HAVING A REMOVABLE BRUSH HEAD
Leslie F. Sawyer, Winter Park, Fla., assignor to Colonial Silver Company, Inc., Orlando, Fla., a corporation of Florida
Filed Apr. 24, 1964, Ser. No. 362,273
4 Claims. (Cl. 15—176)

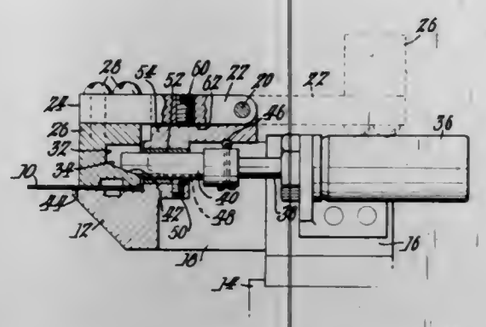


1. A toothbrush comprising a hollow handle, a brush head holding device fixed to one end of the handle, said brush head holding device having an end wall fixed to said one end of the handle, a base plate extending axially forwardly of the handle from one edge of the end wall, a flange at the outer end of the base plate having a rearwardly extending projection thereon, and a tongue extending forwardly from the end wall generally parallel to the base plate and having a fixed end portion extending rearwardly through an opening in said end wall and into the handle, the tongue being secured to portions of said end wall surrounding its opening for fixing the tongue against axial movement and for sealing the handle to prevent bacterial growth therein, and a separate brush head comprising a base seated on the base plate and having a longitudinally extending socket receiving the tongue, the base having one end engaging the end wall of the holding device and its opposite end being recessed to receive the projection on the flange, said base plate of the holding device being flexible for bending the base plate away from the tongue to permit the brush head to be inserted into and removed from the holding device.

3,271,806
BRUSH
Heinz Helmken, 2921 S. 12th Ave., Broadview, Ill.
Filed May 27, 1964, Ser. No. 370,434
1 Claim. (Cl. 15—176)

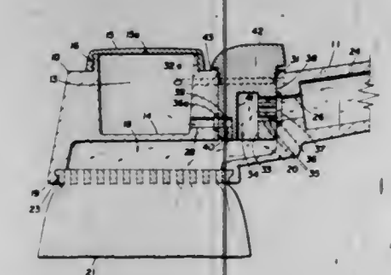
A brush comprising an elongated handle having a head-engaging planar circular surface at one end angularly disposed to the longitudinal axis of said handle and provided with a concentric through aperture normal to said surface; and a brush-head including a cylindrical metal sleeve open at both ends, a plurality of bristles extending axially out one end of said sleeve, a screw extending concentrically through said sleeve and extending axially out the other end of said sleeve, potting material filling said sleeve securing said bristles and imbedding a portion of said screw, said screw extending through said aperture in said handle, and nut means on said screw securing said brush-head to said handle at an angle to the longitudinal axis thereof.

3,271,807
DEVICES FOR USE IN APPLYING SURFACE TREATING LIQUIDS
Samuel Cabot, Boston, Mass.
(241 Perkins St., Jamaica Plain 30, Mass.)
Filed Apr. 1, 1963, Ser. No. 269,615
1 Claim. (Cl. 15—223)



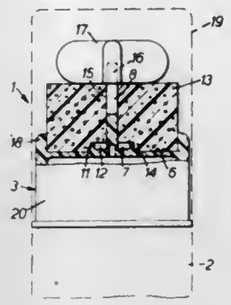
A device for applying a surface treating material, such as paints, varnishes, and the like, said device comprising a plurality of flexible paper sheets, each having a surface-engaging end in the form of a torn edge, means interconnecting said sheets in mutually reinforcing relationship with their surface-engaging ends lined up, one behind another, said means interconnecting said sheets above said ends to form a capillary surface between adjacent free end portions of said sheets.

3,271,808
POWER OPERATED DOCTOR BLADE HOLDER
Roger E. Bedard, Auburn, Mass., assignor to Lodding Engineering Corporation, Auburn, Mass., a corporation of Massachusetts
Filed June 8, 1964, Ser. No. 373,377
11 Claims. (Cl. 15—256.5)



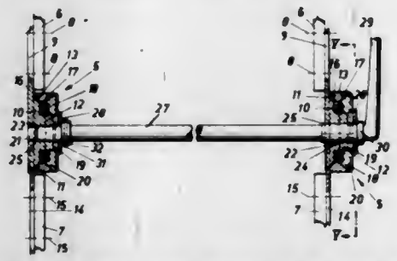
1. A doctor blade holder for a doctor blade comprising an elongated bar, means supporting the bar, a supporting surface on the bar against which the doctor blade is to be clamped, a member to cooperate with said supporting surface for clamping the doctor blade between the member and the surface, said member being movable to and

from said clamping surface, means for moving the member from a blade-release position to a blade-clamping position, said means including a fluid-operated cylinder, a rod actuated thereby, cooperating cam means between the rod



and the member operative to urge the member to blade-holding position upon motion of the rod under influence of the fluid-operated cylinder, said rod having a retracted, inoperative position completely free of the member.

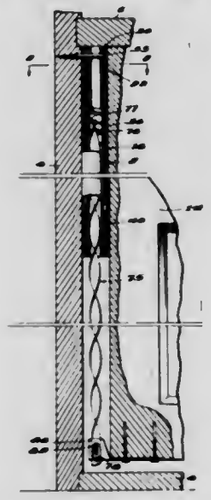
3,271,809
FOUNTAIN BRUSH WITH A SOAP RESERVOIR AND VALVE
Janusz Morawski, Toronto, Ontario, Canada, assignor to Ernest Vincent Matura, barrister-at-law, in trust
Filed Mar. 23, 1964, Ser. No. 354,061
14 Claims. (Cl. 15—526)



1. A fountain brush device for use in washing with water and with mixtures of soap and water and comprising: a body portion defining a soap well therewithin and including a skirt with a brush secured therebelow to define a mixing compartment, said brush defining egress from said compartment; a handle secured to said body to define a first conduit along the length thereof said first conduit being in communication with a valve recess defined by said handle by means of a first passageway of reduced cross-section, said valve recess communicating with said mixing compartment and said body defining a second passageway to provide communication from said well to said valve recess; a valve member rotatably located within said valve recess to project thereabove; an interior wall within said valve member to define a cavity therewithin in communication with said mixing compartment, said valve member defining a plurality of comparatively small diameter holes to register with said passageway in said handle to provide communication between said first conduit and said cavity upon said valve member being rotated; and, a portion of said valve member defining a second conduit in communication with said compartment to register with said second passageway, said second conduit being spaced circumferentially from said plurality of holes an amount less than 180 degrees, whereby upon said second conduit being in registration with said second passageway and said soap thereby passing through, said first passageway will be in partial registration with said plurality of holes, thereby to reduce flow of water therethrough.

3,271,810
DISPENSERS FOR LIQUID, POWDER OR THE LIKE MATERIALS
Joseph Peter Raffe, London, England, assignor to Reckitt & Colman (Overseas) Limited, Yorkshire, England, a British company
Filed July 6, 1964, Ser. No. 380,227
Claims priority, application Great Britain, July 4, 1963, 26,626/63
12 Claims. (Cl. 15—539)

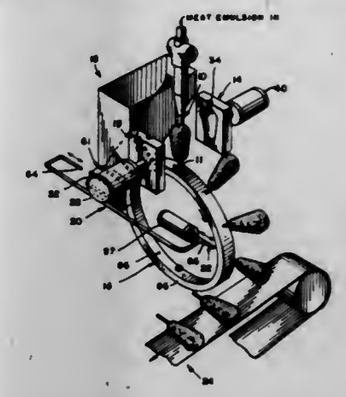
1. A dispenser head comprising a closure element for a container of flowable material, a rod member integral with said closure element and upstanding therefrom to project outwardly of the container, a sealed dispensing hole extending through said closure element and part way into said rod member, a thin-walled region of weakness defined in said rod member by said hole which enables said rod member to be readily broken off from said closure element to unseal said hole, a sponge-form applicator secured on said closure element to apply the material and through which said rod passes completely, and an end of said rod thus projecting from said applicator whereby the said rod can be broken off and withdrawn.



3,271,811
HINGE CONNECTION BETWEEN THE BACK AND THE SEAT OF A CHAIR AND SIMILAR ARTICLES OF FURNITURE
Stig Axel Rune Flodell, Vastra Frolunda, Sweden, assignor to Karl Anders Davidson, Orkelljunga, Sweden
Filed Jan. 30, 1964, Ser. No. 341,261
Claims priority, application Sweden, Feb. 5, 1963, 1,226/63; Jan. 23, 1964, 818/64
7 Claims. (Cl. 16—140)

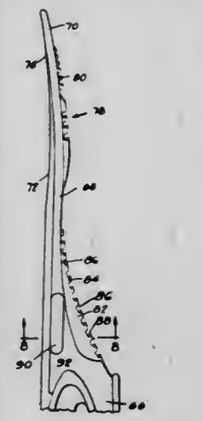
1. In a hinge connection between the back portion and the seat portion of a chair or a similar article of furniture, in particular the front seat of a car, bearing supports each having a conical surface and an arm connected to said seat portion, a bearing housing rotational in relation to said bearing support and having an arm connected to said back portion of said article of furniture, and a bearing washer with a conical surface, said bearing housing further provided with two conical surfaces turned from each other, said bearing support having its conical surface resting against one of said conical surfaces of said bearing housing, the other conical surface of said bearing housing resting against the conical surface of the bearing washer, said bearing washer having a central aperture with a non-circular cross section fitting a central stud shaped in a corresponding way on said bearing support,

said hinge connection further comprising a lever on a screw capable of pressing said bearing washer, said bearing housing and said bearing support axially against each other with their conical surfaces contacting each other, a helical spring attached with one end to said stud, the other end of said spring attached to the said bearing housing, said spring adapted to fold said back portion in forward direction.



3,271,812
WINDOW SASH BALANCES
Phil Skolnik, 13131 Almeda Road, P.O. Box 45558, Houston, Tex.
Filed Mar. 13, 1964, Ser. No. 351,639
10 Claims. (Cl. 16—197)

1. A sash balance for use with a window sash, said balance comprising an elongated casing having a longitudinal axis and including aperture means in one end thereof, said aperture means having an axis transverse to said longitudinal axis, a coil spring one end of which is fixed in another end of said casing, spring anchor means fixed to another end of said spring, a spiral rod, means operatively associating said spiral rod with said spring anchor means so that longitudinal movement of said rod relative to said spring anchor means causes rotary movement of said spring anchor means, and bearing means in said aperture means transverse to said longitudinal axis of said casing, said bearing means longitudinally restraining but rotatably mounting said spring anchor means.



3,271,813
DEVICE FOR MOLDING MEAT PRODUCTS
Louis E. Gernandt and William J. Oestreich, Eau Claire, Wis., assignors to Armour and Company, Chicago, Ill., a corporation of Delaware
Filed Nov. 27, 1964, Ser. No. 414,364
4 Claims. (Cl. 17—1)

1. An apparatus for molding soft plastic materials such as ground meat about a stick handle, comprising a frame, a wheel mounted for rotation in relation to said frame, means for driving said wheel to rotate intermittently to three stations and for locking said wheel firmly against movement in each station, said wheel being provided with apertures spaced equally around and extending through the wheel, said aperture being of substantially the same diameter as said stick handles to permit a tight gripping of said sticks, means at the first of said stations for forcing one end of a stick handle snugly into each of said apertures, two mold halves at the second of said stations located transversely of and adjacent the plane of said wheel, nozzle means at said second station located between and extending into said mold halves when together for dispensing a metered amount of soft plastic material into said mold halves around said stick, each of said mold halves comprising a mold base including a mold cavity communicating with a first channel for receiving the end of said nozzle means, and with a second channel for receiving the other end of said stick handle, a flexible resilient diaphragm covering the entire

mold face, and means for holding said diaphragm tautly over said mold face, means for moving said mold halves together around said stick and said nozzle means at the second station and for moving the mold halves apart, and means at the third of said stations for ejecting said stick from said apertures.

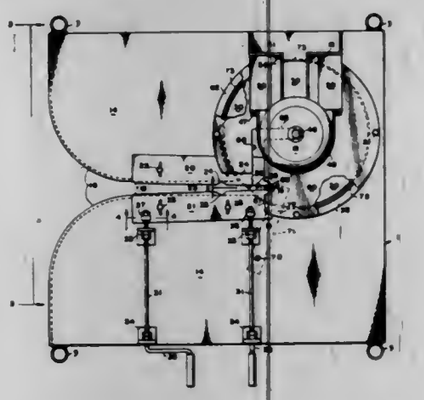
3,271,814
INSTRUMENT FOR DEVEINING AND SHELLING SHRIMP
Thomas S. Gorton, Jr., Cambridge, Mass., assignor to Riverside Inc., Boston, Mass., a corporation of Massachusetts
Original application May 18, 1961, Ser. No. 110,955, now Patent No. 3,178,765, dated Apr. 20, 1965. Divided and this application Nov. 17, 1964, Ser. No. 411,884
15 Claims. (Cl. 17—7)

6. An instrument for deveining and removing the shell from shrimp having a handle portion and an operating tool portion, the forward portion of the tool portion being slightly arcuate in shape and concaved downwardly and the remaining portion of the tool portion being straight, said tool portion having an upper cutting surface extending forwardly from the handle portion.

3,271,815
POULTRY HEAD REMOVER
Eldon Ray Hooley, P.O. Box 246, Creswell, Oreg.
Filed July 10, 1964, Ser. No. 381,795
1 Claim. (Cl. 17—12)

In a poultry processing machine for severing the head of a bird from its neck at the base of the skull while the neck is in longitudinal tension as the bird is advanced

along a rectilinear path of travel suspended from a conveyor, the improvement comprising:



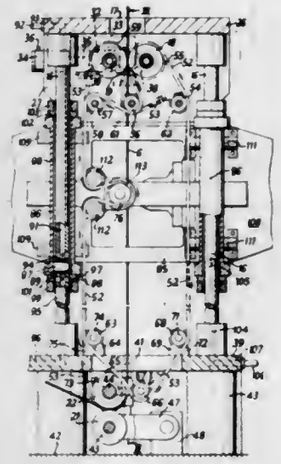
a horizontally disposed table top having a forward end and rearward end,

a horizontally disposed power driven cutting knife rotatably mounted relative to the table top and having a cutting edge on the same horizontal plane as the table top,

said table top having a slot extending from its forward end toward its rearward end,

a pair of opposing flat plates mounted upon the table top in angular spaced relation to each other to provide a passageway converging toward the rearward end of the table top with the rearward end of the plates terminating in overlapping relation to said cutting knife with minimal clearance therebetween,

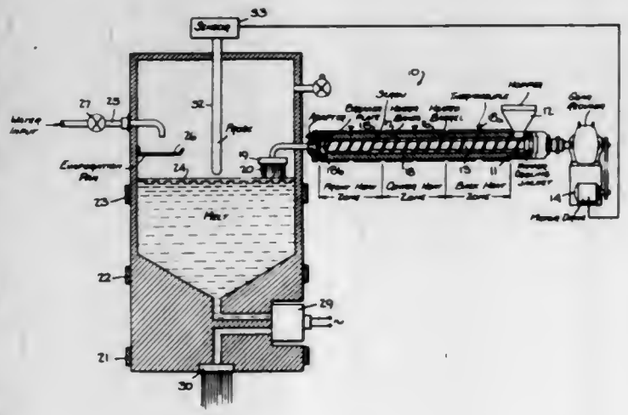
the opposing edges of said plates being smooth surfaced throughout their length having a pair of opposing notches intermediate their ends and thereat dividing said converging passageway into a first zone and second zone,



whereby the neck of a bird being dealt with will be put in gradually increasing tension as it is drawn uninterruptedly through the convergence of said first zone upwardly toward and into sliding contact with the underside of said plates until the skull reaches said notches where the neck tension is momentarily released to position the skull for firm sliding engagement with the underside of the plates with the neck in greater tension in being drawn through said second zone and into the cutting knife, and whereby decapitation will occur precisely at the base of the skull,

a guard for the cutting knife superimposed upon said table top and having a notch therein superjacent the converged ends of said plates to resist movement of the neck out of said converged ends of the plates, and

a stabilizing plate for said cutting knife secured to the underside of said table top with one end thereof in underlying contact with the cutting knife whereby to prevent dragging of any residual skull, neck or flesh particles between the cutting knife and the table top beyond said converging ends of said plates.



3,271,816
APPARATUS FOR MOULDING ARTICLES FROM PLASTIC MATERIALS
Jack M. Schneider, Kingswood, England, assignor to Calmec (Manufacturing) Limited
Filed Apr. 16, 1965, Ser. No. 448,759
Claims priority, application Great Britain, Apr. 22, 1964, 16,731/64; Oct. 21, 1964, 42,903/64
21 Claims. (Cl. 18—4)

1. Apparatus for moulding articles from thermoplastic material comprising an elongated supporting structure which, when disposed close to the outlet of an extrusion apparatus, provides a path along which material emerging from said outlet can be driven, means for driving material emerging from said outlet along the said path, said driving means including means which are adapted to engage material emerging from said outlet and to draw material into said path at a rate which is adjusted relative to the rate of supply of material from said extrusion apparatus so that material of predetermined thickness is supplied to said path, tool means reciprocably mounted on said supporting structure, means for causing said tool means to engage a section of heated material close to said outlet, means for advancing said engaged tool

means along said path in a direction away from said outlet, said tool means effecting a forming operation on the material while in engagement therewith, means coupling said tool advancing means to said material driving means so that said tool means is advanced at a rate substantially equal to the rate of travel of material along said path, means for releasing said tool means from said section of material after travel through a predetermined distance, whereby said section of material retains its formed shape, and means for rapidly returning said tool means along said path to its initial position for engagement with a succeeding section of material.

3,271,817
NYLON MELT-SPINNING APPARATUS
Maurice S. Kanbar, 105 E. 15th St., New York, N.Y.
Filed May 27, 1963, Ser. No. 283,236
6 Claims. (Cl. 18—8)

1. Apparatus for spinning polyamides, comprising:

(a) a melt extruder having a predetermined maximum capacity and including variable speed means to operate said extruder in a range extending from a minimum rate to a rate in accordance with said predetermined maximum capacity, an input and an output,

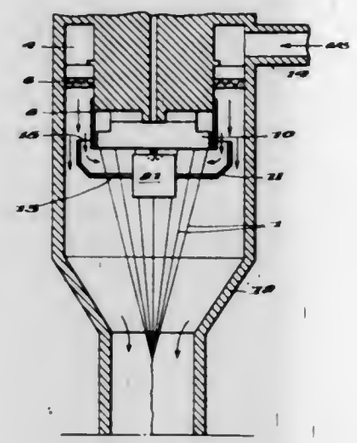
(b) means to feed polyamide flake into the input of said extruder,

(c) means to heat the flake within said extruder to a temperature level sufficient to melt same whereby said polyamide emerges from the output of said extruder in molten form,

(d) a steam treatment chamber,

(e) means coupling the output of said extruder to said chamber to introduce a stream of molten polyamide therein which collects as a melt pool,

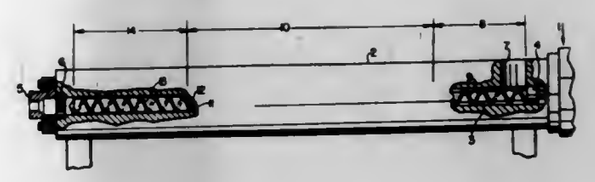
(f) means to feed water into said chamber above said pool,



(g) means to apply heat to said chamber at a temperature level maintaining the molten condition of said pool and vaporizing said water to form steam subjecting said pool to steam pressure,

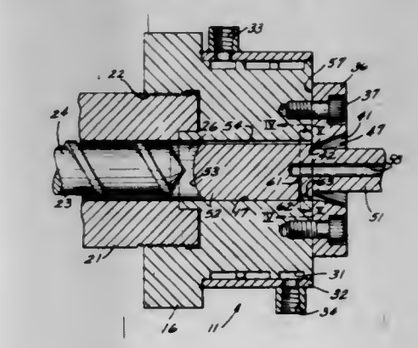
(h) means to regulate said steam pressure in said chamber to maintain a predetermined steam pressure level therein,

(i) a spinneret, and



(j) a metering pump intercoupling said chamber with said spinneret to pass said molten polyamide therethrough to form polyamide filaments, said pump being operable at different rates, the highest of which removes less of said molten polyamide from said chamber than said melt extruder is capable of introducing therein at its maximum capacity.

3,271,818
QUENCHING APPARATUS
James Clarence Bryan, Waynesboro, Va., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Mar. 17, 1965, Ser. No. 440,532
3 Claims. (Cl. 18—8)



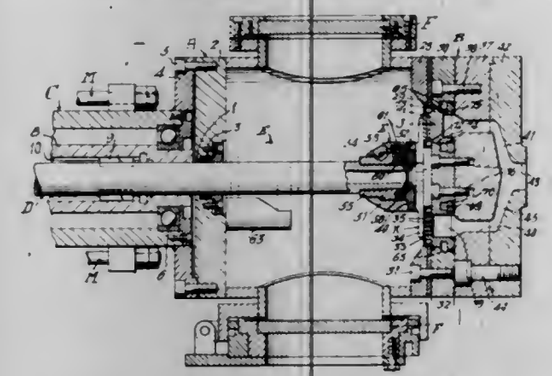
1. In an apparatus for the dry spinning of filaments comprising a spinneret assembly having a plurality of filament-producing orifices arranged in a generally circular pattern, wall means encircling said spinneret assembly and positioned coaxially thereof to define a spinning cell, said wall means being spaced from said spinneret assembly in the region thereof to define an annular passageway for providing a cocurrent stream of heated gas to the spinning cell to evaporate solvent from extruded filaments; the improvement comprising the combination of (a) an obstruction positioned at the center of said circular pattern of orifices to restrict the cross-sectional area of the spinning cell for a substantial distance along the path of filament travel, and (b) a gas-deflecting band positioned internally and coaxially of said wall means and spaced therefrom to divide the flow of gas in said annular passageway, said band having an inwardly flared lip to direct a portion of said gas to the filaments immediately upon their extrusion from the orifices.

3,271,819
EXTRUDER
Frederick K. Lacher, Akron, Ohio, assignor to NRM Corporation, a corporation of Ohio
Filed Feb. 26, 1962, Ser. No. 175,754
3 Claims. (Cl. 18—12)

1. An extruder comprising a cylinder having an inlet for introduction of plastic and like material; a feed screw rotatable in said cylinder having a helical flight effective, upon rotation of said feed screw, to advance material through said cylinder for plasticizing during the course of its flow; said feed screw having successive feed, transition, and metering sections in the direction of advance of the material; said flight, in said feed and transition sections, defining a first helical channel through which material is advanced from said feed section into said transition section and, in said transition and metering sections, defining a second helical channel through which material is advanced from said transition section through said metering section; said channels having restricted communication with each other in said transition section for buildup of pressure in said first channel and for flow of refined material from said first channel into said second channel; said first channel being of progressively decreasing axial width and progressively decreasing radial depth in said transition section; and said second channel being of progressively increasing axial width and progressively decreasing radial depth in said transition section.

3,271,820
PELLETIZER WITH STEAM EJECTION OF PELLETS
James W. Hendry, Scottsburg, Ind., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Filed Aug. 6, 1964, Ser. No. 387,833
9 Claims. (Cl. 18—12)

1. In a mechanism for making pellets of plasticizable material, the combination comprising:

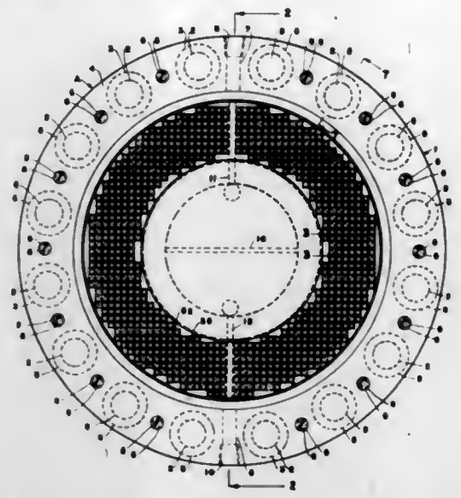


a chamber and feed means for forcing material through said chamber toward one end thereof;

die means at said one end of said chamber having an opening therein for receiving material thereinto from said chamber;

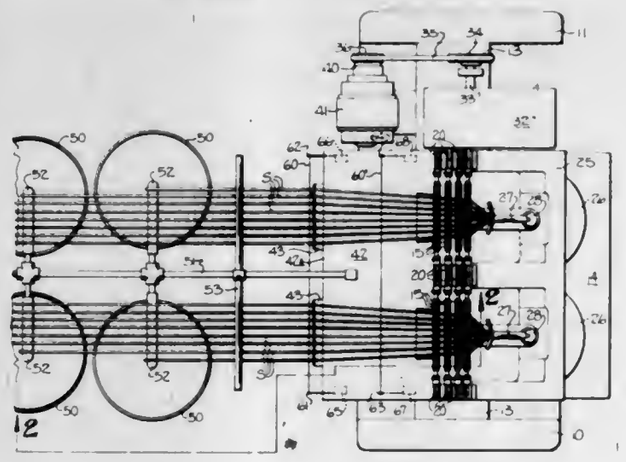
rotatable means independent of said feed means for interrupting the flow of material into said opening; and

ejection means including means forming a passage and rotatable with said rotatable means to register an end of said passage with said opening for ejecting previously received material from said opening, and means for directing a pressure fluid into said passage and toward said opening.



3,271,821
UNDERWATER PELLETIZER
Louis F. Street, Hampton, N.J., assignor to Frank W. Egan & Company, Somerville, N.J., a corporation of New Jersey
Filed July 24, 1964, Ser. No. 384,881
7 Claims. (Cl. 18—12)

1. Apparatus for pelletizing thermoplastic materials comprising a housing, an extrusion die in said housing having a flat face through which extends a plurality of extruding orifices, a drive shaft journaled in said housing with its axis of rotation perpendicular to the face of said die, a cutter head adapter on said shaft and a cutter head having a universal connection to the end of said cutter head adapter rotatable therewith and tiltable thereon and movable relative to said cutter head adapter longitudinally thereof, a plurality of cutting blades mounted on said cutter head and extending outwardly beyond the periphery thereof and adapted to slide over and in contact with said face of the die upon rotation of said drive shaft to cut material extruded from said orifices, yielding means pressing said cutter head toward said die to maintain constantly yielding contact of the blades with said die face, and means limiting movement of said cutter head toward the die face comprising a shoulder on said cutter head and a shoulder on said cutter head adapter, both of said shoulders being disposed at the side of said universal connection opposite said die face, said shoulders abutting each other under the influence of said yielding means upon movement of the cutter blades out of contact with the die face and being held in spaced apart relation to each other so long as said cutter blades are held in contact with said die face by said yielding means.



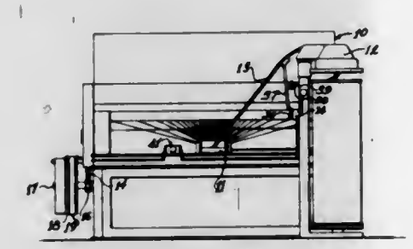
3,271,822
CARBIDE FACING FOR EXTRUSION DIES
Del H. Rhino, Rogers, Ark., assignor to United-Greenfield Corporation, Chicago, Ill., a corporation of Delaware
Filed Jan. 15, 1965, Ser. No. 425,722
6 Claims. (Cl. 18—12)

2. An extrusion die comprising a die-body having a forwardly presented face and provided with a plurality of extrusion ports which terminate at the forwardly presented face, and a plurality of discrete wafers formed from a different and substantially harder material than the die-body, the wafers being brazed to the forward face and having extrusion apertures which register with the terminal portions of the extrusion ports, whereby extrusion

material in a plastic state will pass in order through the extrusion ports, through the extrusion apertures, and out of the die in an extruded configuration.

3,271,823
STOP MOTION FOR TEXTILE FIBER DRAFTING MACHINE
Joe R. Whitehurst, Bessemer City, N.C., assignor to Ideal Industries, Inc., Bessemer City, N.C., a corporation of North Carolina
Filed Nov. 29, 1963, Ser. No. 326,780
9 Claims. (Cl. 19—.25)

1. In a drawing frame having sets of fiber drafting rolls through which a plurality of side-by-side fibrous textile strands are adapted to be passed from a strand supply source, drive means for imparting movement to said drafting rolls, guide means disposed between said drafting rolls and the strand supply source and engageable with the moving textile strands to guide the strands along a predetermined path into said drafting rolls, and actuator means operable to stop said drive means and rotation of said drafting rolls, the combination therewith of strand actuated stop motion means operatively connected to said actuator means and comprising



(a) an elongated detector element comprising a pliable strand positioned in advance of said drafting rolls and extending in a substantially straight condition transversely beneath and normally out of engagement with the moving strands as the same move along said predetermined path toward said drafting rolls,

opposite ends of said pliable strand being positioned closer together when a moving textile strand moves a certain distance below said predetermined path and engages the pliable strand and exerts a pulling force thereon, and wherein said pliable strand is a monofilament nylon line having a diameter of about 15 thousandths of an inch, and wherein the moving textile strands have a diameter on the order of one-half inch,

(b) means supporting opposite ends of said detector element and including a movable support for at least one end of said detector element, said movable support being movable in response to a force being applied to said detector element by any of the strands, and

(c) switch means operatively connected to said movable detector element support and to said actuator means and being operable in response to movement of said movable detector element support to operate said actuator means and stop rotation of said drafting rolls.

3,271,824
STOP MOTION FOR CARDS
Elmer D. South, Columbus, Ga., assignor to Swift Manufacturing Company, a corporation of Georgia
Filed Jan. 16, 1964, Ser. No. 338,033
1 Claim. (Cl. 19—.22)

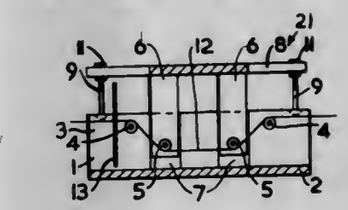
In apparatus for stopping the carding operation of a card upon interruption of the running of its sliver in a predetermined path between its calender rolls and coiler, said card having a driven element, a driving element and a movable member disposed to engage said driving element with said driven element upon movement of said movable member in one direction whereby the carding operation is carried on and disposed to disengage said driving element and said driven element upon movement in another direction whereby the carding operation is stopped, the improvement which comprises:

(a) a sliver engaging lever provided with an adjustable counter-balance thereon mounted in position to engage the sliver between the calender rolls and the coiler and move laterally in response to the resistance of the sliver to lateral deflection decreasing so that the sliver moves out of said predetermined path between the calender rolls and the coiler,

(b) a normally open switch element mounted in position to be closed by said sliver engaging lever upon lateral movement of said sliver engaging lever,

(c) an electrical solenoid operatively connected to said movable member whereby upon energizing said solenoid said movable member moves in said another direction to disengage said driving element and said driven element and thereby stop the carding operation,

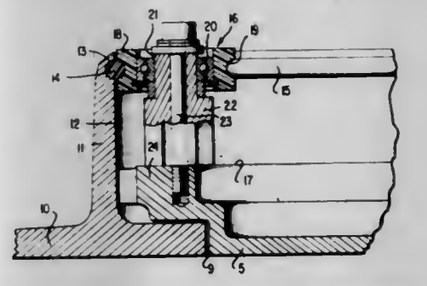
(d) a spring member urging said movable member toward said one direction whereby the carding operation is carried on while said solenoid is deenergized,



(e) an electrical circuit having said normally open switch therein and disposed to supply electrical current to said solenoid upon closing said normally open switch,

(f) an electrically actuated signal device in said circuit disposed to emit a signal when said normally open switch is closed,

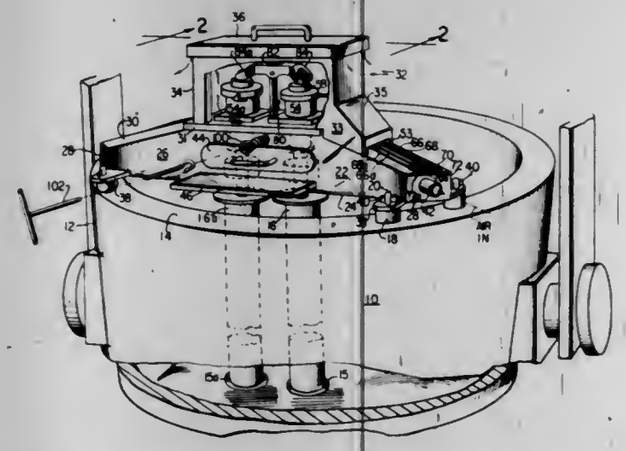
(g) a normally closed switch element in said circuit having a laterally projecting member disposed to move in a horizontal plane at an elevation to be opened by a knee of an operator whereby said solenoid is deenergized which said normally open switch is closed, and



(h) a spring member urging said laterally projecting member outwardly to close said normally closed switch immediately upon release of said laterally projecting member.

3,271,825
METHOD OF CONDITIONING GLASS FIBER STRANDS
William Joseph Dennis, Guelph, Ontario, Canada, assignor to Fiberglas Canada Limited, Toronto, Ontario, Canada
Filed Oct. 3, 1963, Ser. No. 313,632
6 Claims. (Cl. 19—65)

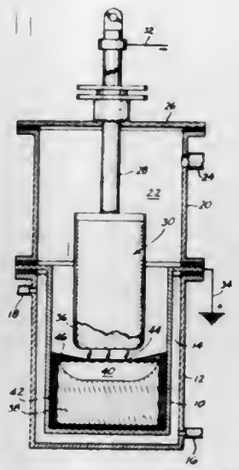
1. A method of tensioning and spreading filaments of a sized glass fiber strand to improve permeability thereof for subsequently applied liquid material, said method comprising the steps of feeding the strand under tension along a first linear path, deviating said strand from said first linear path into a second linear path by moving said strand in a first arcuate path 1/8 to 3/16 inch in diameter and engaging said strand along said first arcuate path with a smooth continuous surface, deviating said strand from said second linear path into a third linear path by moving said strand in a second arcuate path 1/8 to 3/16 inch in diameter and engaging said strand along said second arcuate path with a smooth continuous surface, moving said surfaces at the same speed as said strand to avoid creation of excess heat and thereby effecting a separation of the filaments in the strand to obtain maximum permeability therein.



3,271,826
TEXTILE COILER TUBE GEAR MOUNTING
Harold P. Jackson, McDonough, Ga., assignor, by mesne assignments, to Ideal Industries, Inc., Bessemer City, N.C., a corporation of North Carolina
Filed Feb. 27, 1964, Ser. No. 347,828
3 Claims. (Cl. 19—159)

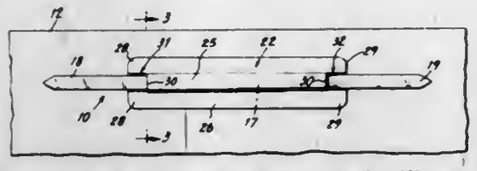
1. A textile coiler comprising a stationary spectacle having a vertically extending spectacle ring, a tube gear rotatable about a vertical axis, resilient annular track means on the inner surface of said spectacle ring projecting radially inward therefrom toward said vertical axis, a plurality of rollers mounted on the upper surface of said tube gear near the outer periphery thereof for

rotation therewith and for rotation about their respective axes, each roller having a groove in the rim portion thereof engaging said track means to support said tube gear for rotation with respect to said spectacle and to maintain said tube gear against axial or radial movement with respect to said spectacle while accommodating slight misalignment therebetween, and each roller mount including eccentric means for adjusting the roller radially with respect to said tube gear to position said tube gear accurately with respect to said spectacle ring.



3,271,827
STOPPER ROD ACTUATING DEVICE
Richard S. Crowell, Bloom Township, Ill., and Thomas A. Cuscino, Baldwin, Pa., assignors to United States Steel Corporation, a corporation of Delaware
Filed Apr. 22, 1964, Ser. No. 361,673
3 Claims. (Cl. 22—85)

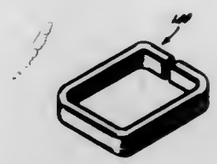
3. For a bottom pour ladle containing molten metal having at least one discharge nozzle in the bottom, a hollow supporting beam extending over the ladle between two predetermined points on the rim thereof and secured to said rim, stopper rod means comprising one stopper rod assembly for each discharge nozzle depending from said supporting beam, hydraulic means comprising a fluid actuated cylinder operatively connected to each stopper rod assembly and supported by said supporting beam, and means for circulating air through said hollow supporting beam to cool said hydraulic means and related mechanism.



3,271,828
CONSUMABLE ELECTRODE PRODUCTION OF METAL INGOTS
Stephen Matheson Shelton, Henry Gordon Poole, and Frank Roy Wagy, Albany, Oreg., assignors to Oregon Metallurgical Corporation, Albany, Oreg., a corporation of Oregon
Filed Sept. 20, 1963, Ser. No. 310,425
3 Claims. (Cl. 22—200)

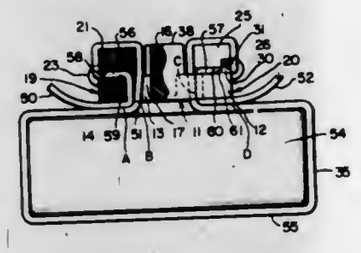
1. In a consumable electrode method of forming metal ingots from a metal body and a flux, wherein an ingot mold is supported beside a metal body in a position to collect a pool of molten metal arc fused off from said body, the method comprising establishing a controlled non-atmospheric environment extending from the metal body to the ingot mold, with said environment established, arc-fusing off successive portions of said metal body by passing an electric arc from said body to said ingot mold with said arc producing a heat zone extending from the body to the mold; concurrently with the arc-fusing of said body, adding progressively successive increments of flux to said heat zone with such flux melting and floating on said molten pool; concurrently with the progressive addition of such flux, continuously removing the flux from the heat zone by distributing the flux while molten and with the flux separated from the metal to regions spaced outwardly of the heat zone, to leave an area on the surface of the molten pool contacted by the arc which tends to remain free of flux; and while arc

fusing off the metal and distributing the flux, maintaining the controlled non-atmospheric environment which extends from the metal body to the ingot mold, which environment embraces said area on the surface of the molten pool which tends to remain free of flux.



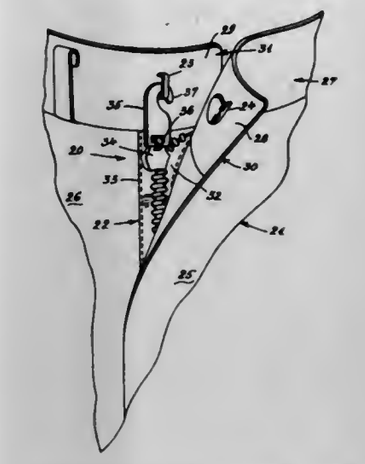
3,271,829
FASTENER MEANS
Joseph T. Corey, Williamsville, N.Y., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Apr. 15, 1965, Ser. No. 448,525
2 Claims. (Cl. 24—153)

1. A device for fastening papers or the like to a backing member, said device comprising
(a) an elongated strip member disposed on the backing member and having spaced and parallel longitudinally extending upper and lower straight edges,
(b) said strip member having an intermediate portion and spaced prong end portions extending from said intermediate portion,
(c) an elongated overlay member disposed over the intermediate portion of said strip member with said prong portions projecting beyond the transverse side edges of said overlay member,
(d) said overlay member having spaced and parallel longitudinally extending marginal portions each arranged on the backing member in substantially coplanar relationship with said strip member and each disposed adjacent a said longitudinal straight edge thereof,
(e) adhesive means provided on the underside of said overlay member securing said overlay member to the intermediate portions of the strip member and said marginal portions thereof to the backing member, and
(f) positioning arms on opposite ends of said marginal portions projecting beyond the transverse edges of the overlay member with adjacent arms of said marginal portions each positioning therebetween one of said prong portions to prevent transverse movement of said prong portions on said backing member,



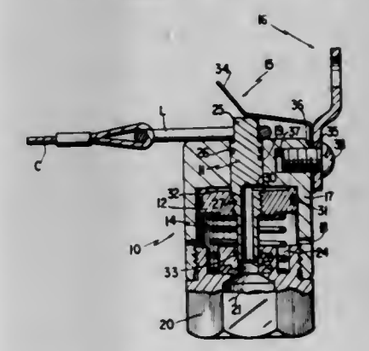
(g) said prong portions disposed in coplanar relationship with said positioning arms and adapted to be bent toward or away from said backing member.

3,271,830
BUCKLE FORMING STOCK
Ragnar W. Winberg, 115 W. Elder Ave., Floral Park, N.Y.
Original application Mar. 10, 1960, Ser. No. 14,047, now Patent No. 3,111,156, dated Nov. 19, 1963. Divided and this application Sept. 19, 1963, Ser. No. 310,090
4 Claims. (Cl. 24—163)



3. A buckle body formed from a length of buckle-forming stock comprising an elongated core strip including a main core section and a clinching section extending along one side edge thereof, and an elongated facing strip of a width in excess of said core strip and including a main facing section medially of said facing strip and confronting one face of said main core section and auxiliary facing sections along opposite sides of said main facing section, one of said auxiliary facing sections being wrapped about said clinching section and folded back to extend over the opposite face of said core strip, the other of said auxiliary facing sections being folded back to extend over said opposite face of said core strip, said clinching section being folded back against said opposite face of said main core section and said auxiliary facing sections extending between said folded back clinching section and said main core section to clinch said facing strip about said core strip to form said length of buckle-forming stock, said length of buckle-forming stock being bent into the polygonal form to form said buckle body.

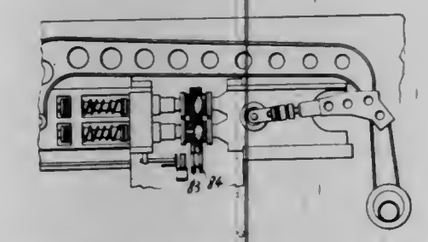
3,271,831
BUCKLE MEANS
Walter J. Litwin, 4465 N. Forest View, Chicago, Ill.
Filed Apr. 20, 1964, Ser. No. 361,090
8 Claims. (Cl. 24—200)



1. A buckle comprising a planar flexible plastic structure comprising a center section, a pair of end clamp bars, and a pair of hinge means each hingedly connecting each clamp bar to a respective opposite end of the center section, said center section comprising a body portion having a pair of end bars adjacent to and generally parallel with the respective clamp bars, said body portion having an intermediate reaction bar generally parallel with the end bars and defining belt passages therewith, said clamp bars being spaced transversely from the respective end bars in the open position of the buckle and being adapted to be swung over and toward said end bars with a belt looped thereabout and drawn through the respective belt passages to hold the belt between the clamp and end bars.

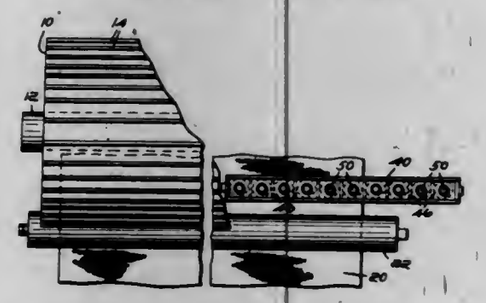
3,271,832
LOCKING SLIDE FASTENER
Francis J. Yankers, 26 Hix Ave., Newton, N.J. 07860
Filed May 5, 1965, Ser. No. 453,264
10 Claims. (Cl. 24—205.11)

1. In a garment, the combination of a pair of flaps, an opening formed between said flaps, one of said flaps overlapping the other of said flaps to form an overlapping flap and an underlapping flap, and a slide fastener assembly secured to said flaps, said slide fastener assembly comprising a slide fastener unit, a loop and a hook, wherein said slide fastener unit comprises a pair of slide fastener elements, a locking slide for securing said slide fastener elements together, a pull tab hingedly secured at one end to said locking slide and hooking means carried by said pull tab for hooking to said loop, wherein one of said slide fastener elements and said loop are secured to the front side of said underflap and the other of said slide fastener elements and said hook are secured to the rear side of said overflap, the opening of said loop lying on an axis substantially perpendicular to the longitudinal axis of said slide fastener assembly, and said hooking means being so formed as to be moveable into said loop and engageable therein.



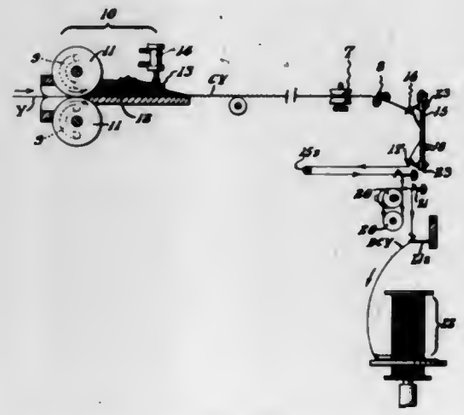
3,271,833
PRESSURE OPERATED RELEASE DEVICE
Benjamin Wendroff, Teaneck, N.J., assignor to Specialties Development Corporation, Belleville, N.J., a corporation of New Jersey
Filed Nov. 20, 1964, Ser. No. 412,787
4 Claims. (Cl. 24—230)

1. A pressure operated release device comprising a body formed with a cylinder having an opening in one end thereof, a piston slidably mounted in said cylinder having a stem secured thereto, means in said cylinder for admitting fluid medium under pressure into said cylinder to effect operation of said piston from one position to another position, said stem being extended through and outwardly of said opening when said piston is in one position to support a link connected to a cable and being retracted within said opening when said piston is



in another position to release the link, and a resilient guard attached at one end on said body having a section positioned across said opening and engaged by the free end of said stem when extended to hold the link captive while said stem is extended.

3,271,834
MACHINES FOR STAMPING TABLETS OF SUBSTANCES HAVING A PASTY CONSISTENCY
Carlo Mazzoni, 10/12 Viale Trentino, Busto Arsizio, Varese, Italy
Filed May 21, 1965, Ser. No. 457,695
Claims priority, application Italy, May 23, 1964, 11,423/64; Oct. 19, 1964, 22,405/64
12 Claims. (Cl. 25—7)

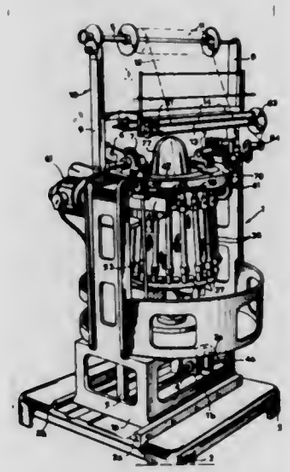


1. A machine for stamping tablets from substances having a pasty consistency which comprises:
(A) interacting die halves operable to compress the substance, and to eject the excess quantity of said substance therefrom;
(B) at least one revolving box defining a plurality of apertures; said apertures defining channels; said revolving box having an inside wall;
(C) rotating means to rotate said revolving box on an axis parallel to the die halves;
(D) said revolving box connected in operable position with respect to said die halves so that the excess substance ejected by said die halves upon compression thereof, is translated into said channels defined by the apertures of said revolving box to the inside wall of said revolving box, said excess substance adhering to said inside wall;
(E) means to eject the formed tablets from said die halves into the apertures of said revolving box, the excess substance causing the tablets to adhere to the apertures when the die halves are withdrawn from each other;
(F) means for discharging the stamped tablets from the apertures of said revolving box.

3,271,835
FABRIC TENSIONING DEVICE FOR SHEARING MECHANISMS
Wilfred N. Hadley, Springfield, Vt., assignor to Hadley Company, Inc., Springfield, Vt., a corporation of Vermont
Filed Feb. 27, 1964, Ser. No. 347,758
4 Claims. (Cl. 26—15)

1. In a cloth shearing machine, a rotatably mounted cylinder having a plurality of spaced shearing blades extending longitudinally thereof at its periphery, a ledger knife disposed longitudinally of the cylinder and having one longitudinal margin in shearing relation with the blades, means for supporting in full width and conducting longitudinally at predetermined tension through the machine to and past the ledger knife and blades a strip of fabric to be sheared, a series of juxtaposed elements disposed in alignment forwardly of the ledger knife and extending transversely of the strip to a limited extent less than the full width thereof and in contact with one face of the strip at one marginal portion thereof, and common housing means supporting the elements for limited independent movement toward and in fabric tensioning contact with said face whereby said elements remove slack from said marginal portion and hold the strip taut as it passes to the ledger knife and shearing blades.

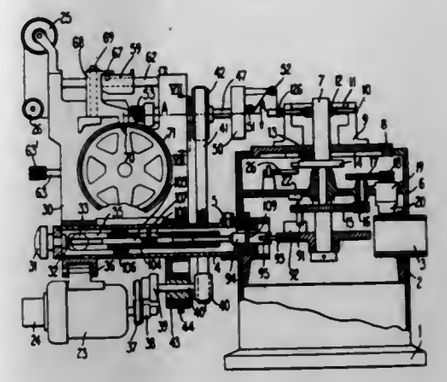
3,271,836
METHOD OF MAKING DISTORTED CRIMPED YARN
Nathan Rosenstein, West Hartford, Conn., assignor to Spunize Company of America, Inc., Unionville, Conn., a corporation of Connecticut
Filed Apr. 6, 1965, Ser. No. 445,998
3 Claims. (Cl. 28—72)



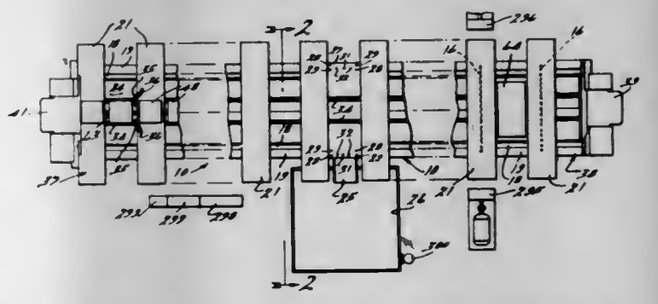
1. In a method of making distorted crimp synthetic thermoplastic yarn the steps which comprise
folding said yarn upon itself and subjecting it to pressure while folded, thus forming the yarn with a multiplicity of successive V-shaped crimps of unequal lengths which are slightly flattened at the apices of the V's
drawing the crimps while under tension over an edge, and controlling said tension to an amount for physically distorting the apices of the V-shaped crimps by wiping action under tension into portions of greater width than the diameter of the uncrimped portion of the yarn.

3,271,837
METHOD OF MANUFACTURING STOCKINGS FROM TWO-COMPONENT FILAMENTS
Tin Yam Au and Earl Herbert Olson, Wilmington, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed Sept. 25, 1964, Ser. No. 399,401
3 Claims. (Cl. 28—74)

1. A process for manufacturing a stocking knit from a nylon two-component crimpable filament whose two components are of fiber-forming molecular weight and have dissimilar shrinkage values, comprising in order the steps of (1) knitting a stocking from the said two component filament, (2) relax-steaming said stocking at a temperature of from about 215° F. to 250° F. with substantially saturated steam for a period of at least about one minute, (3) dyeing the said stocking and (4) postboarding the said stocking in a steam chest at a temperature of from about 230° F. to 255° F. for a period of at least about 30 seconds, whereby the stocking exhibits a stress retention of at least about 60% in the knee and ankle region subsequent to said postboarding.



3,271,838
MACHINE FOR CUTTING TUBULAR FABRIC
Luigi Pisani and Giuseppe Spaltini, both of Cilavegna, Pavia, Italy, assignors to S.p.A. Virginio Rimoldi & C., Milan, Italy, and Officina Meccanica Pisani & Spaltini, Cilavegna, Pavia, Italy
Filed May 18, 1965, Ser. No. 456,622
Claims priority, application Italy, May 21, 1964, 11,140/64; Apr. 14, 1965, 9,237/65
15 Claims. (Cl. 29—2.16)

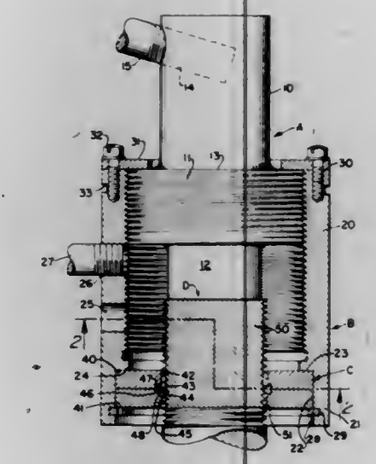


1. Machine for cutting upon the bias an endless band from a tubular, more particularly knitted fabric, comprising a top frame rotating about a vertical axis and supporting a horizontally extending roll of tubular fabric, from which the fabric is unrolled and is slipped after resuming its tubular form over an underlying rotary member comprising a plurality of articulated arms arranged to form an upwardly tapering conical frustum and supporting at their bottom ends radially orientated rollers idly rotating about horizontal axes, means for varying the inclination of said conical frustum, a plurality of arms articulated by their top ends to the base of the rotary frame, extending downwardly in a substantially parallel relationship to the arms forming the rotating conical frustum, against which they are held close by the action of resilient means, said arms articulated to the top frame supporting at their bottom ends rollers rotatable about horizontal axes, tangential to the circular development of the fabric slipped over the conical frustum and cooperating with the rollers on the internal rotary member, means for rotating at an adjustable speed the outer rollers in order to feed the fabric downwardly and a circular cutter cooperating with a backing roller, both supported by stationary supports, for cutting an endless band from the bottom edge of the tubular fabric.

3,271,839
CONTINUOUS COIL WINDING MACHINE
Giuseppe Camardella, Via E. Biondi 1, Milan, Italy
Filed Sept. 30, 1965, Ser. No. 491,801
Claims priority, application Italy, Oct. 3, 1964, 21,342/64
18 Claims. (Cl. 29—33)

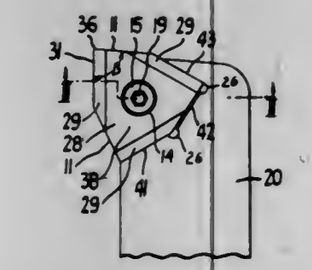
1. Continuous coil winding machine adapted for mass production of entirely finished coils on supports or in air, and provided with a carousel conveying the coils, a series of finishing stations, in which the coil, conveyed by the carousel, will be operated and an easily interchangeable control cam, one of said stations comprising a wire guide associated with a control device for the rotation of the wire guide, adapted to ensure the displacement of the latter in the direction of its rotating axis under the control of said cam, said control device having a rotary but axially stationary hollow driving shaft, driving means to set in rotation said driving shaft, a driven shaft associated with the wire guide and disposed inside the driving shaft both said shafts being provided with longitudinal grooves on the opposite faces, inside which rolling means engage, having key function for the rotating motion drive.

3,271,840
AUTOMATIC MACHINING DEVICE
Frank A. Solski, Bloomfield Hills, Mich., and Lyman K. Shepard, Upper Saddle River, N.J., assignors to Standard Tool & Manufacturing Company
Filed Mar. 19, 1963, Ser. No. 266,264
10 Claims. (Cl. 29—33)



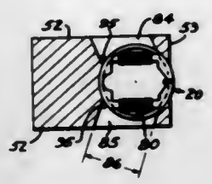
1. In a machine, a base structure made of a plurality of like sections having a cooling trough thereon, a plurality of bridge members disposed transversely of said structure and spaced the same predetermined interval apart, trough means about the edge of said bridge members having discharge ends located above said base structure trough, a series of pallets, rail members on said bridging members disposed parallel to said base structure for supporting said pallets at said intervals, means for simultaneously advancing said pallets to said intervals, means independent of said advancing means for locating and clamping said pallets after each advancement, and means on at least some of said bridge members for performing a machining operation on a workpiece supported by said pallets.

3,271,841
TOOL FOR BROACHING SPLINE NOTCHES INTO BOLT OR SHAFT THREADS
Frederick W. Rohé, 5191 S. Bradford, Placentia, Calif., and Charles S. Phelan, Tustin, Calif.; said Phelan assignor to said Rohé
Filed June 8, 1964, Ser. No. 373,333
11 Claims. (Cl. 29—95.1)



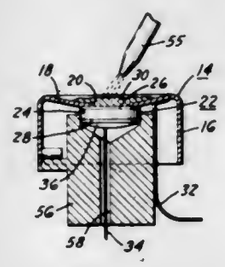
1. In a tool for broaching spline notches in threads of a threaded element, in combination: a sleeve having an

internal thread extending inwardly from one end thereof and having a socket in its other end; an annular broach plate secured in said socket; and a ram having a male threaded part coupled in said internal thread and means on the outer end of said threaded part for transmitting axial pressure to said sleeve so as to effect a broaching pass of said broach plate over threads of a threaded element supported in opposed axially aligned relation to



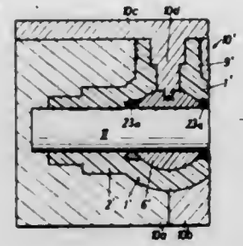
said broach plate, said ram further including a stop on the inner end of said threaded part, engageable with the end of said threaded element to limit the axial extent of said pass, said ram being rotatable in said sleeve with a threading action for adjusting the depth of said stop within the sleeve, thereby to vary the extent of said pass as limited by said engagement of the stop against the threaded element.

3,271,842
EXCHANGEABLE TOOL BIT
Robert Breuning, Hauptstrasse 58, Besigheim (Neckar), Germany
Filed May 25, 1964, Ser. No. 369,913
Claims priority, application Germany, July 16, 1960, B 58,624; Aug. 20, 1960, K 41,512
10 Claims. (Cl. 29—96)



1. An exchangeable tool bit adapted to be attached to a tool holder, comprising, in combination, a plate of hexagonal contour having an upper face and a lower face substantially parallel to each other and six side faces of substantially equal length and extending between said upper and lower faces substantially perpendicular thereto, said side faces intersecting said upper and lower faces along upper and lower edges, respectively, every second one of said upper edges and every second one of said lower edges being formed as a cutting edge, said plate of hexagonal contour having three substantially equal corner angles of a magnitude between 82° and 88° and defined each by a pair of two adjacent ones of said side faces, and means for attaching said plate to a tool holder.

3,271,843
METHOD OF MAKING A MAGNETIC RECORDING HEAD
Charles L. Vice, Pasadena, Calif. (85 Gresham Lane, Atherton, Calif.)
Filed Sept. 27, 1962, Ser. No. 226,542
8 Claims. (Cl. 29—155.5)



1. A method for making a magnetic recording head assembly of the type which includes a body support having a face and an outer wall and with a magnetic core secured therein, comprising: boring a hole into the body near the face and parallel thereto, the radius of the hole being smaller than the distance of the center of the hole from the face; undercutting a groove into the wall of defining the hole from within said hole and substantially concentric thereto, the depth of the groove being greater than the difference between the radius and said distance, so that the groove forms an opening in the face; forming an entry port through the outer wall of the body into the groove; providing said core gap in the opening and the core seated in the groove, with at least a portion of the periphery of said core having an arc of radius substantially equal to that of the groove, and having a pair of parallel sides spaced apart by a distance less than the width of the entry port; inserting said core through the entry port with the said parallel sides aligned therewith, then rotating the core in position in the groove; and securing the core to the body in the groove.

3,271,844
METHOD OF MAKING HEAT SENSOR UNIT
Robert W. Smith, Flint, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed July 15, 1963, Ser. No. 295,145
3 Claims. (Cl. 29—155.63)

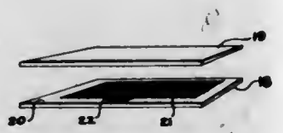
2. In a method for manufacturing sensor units the steps comprising, forming a thermistor element, forming a support element having a dished surface with a central opening therethrough, locating a portion of said thermistor element in engagement with the thermistor support element around the opening therethrough, spray metalizing the juncture between the support element and the thermistor element, and filling the support element opening and the dished surface by spray metalizing to form a substantially planar surface on the dished surface adapted to be located in direct heat transfer contact with an object whose temperature is to be sensed by the thermistor element.

3,271,845
METHOD OF MANUFACTURING ROTARY VALVES
Rudolf Breher, Hausberge an der Porta, Germany, assignor to Friedrich Stubbe, Vlotho (Weser), Germany
Filed Jan. 23, 1962, Ser. No. 168,105
Claims priority, application Germany, Feb. 11, 1961, St 17,453; Sept. 6, 1961, St 18,290
4 Claims. (Cl. 29—157.1)

1. A method of manufacturing a rotary valve having a molded housing of synthetic material formed integrally with connecting branches and a rotary member having a spindle rotatably mounted in said housing, comprising the steps of

prefabricating a rotary member with a passage therethrough,

prefabricating sealing rings of plastic material,



mounting said rotary member and said sealing rings on a core extending through and beyond both ends of the passage of said rotary member with said sealing rings tightly engaging said rotary member,

inserting said rotary member jointly with said core and said sealing rings into a confined space of an inner configuration complementary to the outer configuration of said housing, said core being adapted to form passages for said connecting branches,

molding said housing within said confined space around said rotary member and around said core and said sealing rings, and

removing the finished product from said confined space and removing said core from said rotary member, said housing and said sealing rings after said synthetic material of said housing has set.

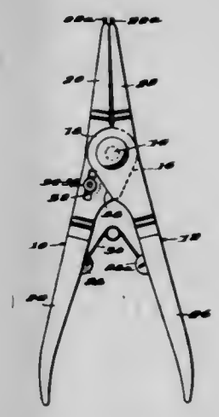
3,271,846
MULTI-LAYER LAMINATES AND METHOD OF MANUFACTURING HOLLOW ARTICLES THEREFROM
Calvin F. Buechele, Louisville, and John R. Westwood, Erlanger, Ky., assignors to Reynolds Metals Company, Richmond, Va., a corporation of Delaware
Continuation of application Ser. No. 177,688, Feb. 7, 1962. This application Nov. 10, 1965, Ser. No. 510,442
12 Claims. (Cl. 29—157.3)

1. In making hollowed products by selective expansion of areas of a multi-layer laminate, the process which comprises

supporting in a die a multi-layer laminate characterized by having adjacent layers peelably bonded together at the interface therebetween including at least a substantial part of said interface in the areas thereof to be expanded,

introducing fluid under pressure between said adjacent layers where the bond is,

breaking said bond in an increment of the area to be expanded,



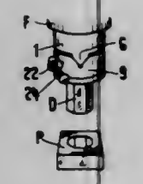
progressively working and expanding the thus separated portion of at least one of said layers into said die by the pressure of said fluid while said layers in an adjacent increment of said area to be expanded are restrained from peeling by said bond,

continuing to progressively break said bond in successive increments of the area to be expanded, along the direction in which the fluid flows,

and to work and expand the thus separated successive portions of at least one of said layers,

whereby there is accomplished said selective expansion without exposing the separated portions of said laminate, along the boundaries of said area to be expanded, to the full load of expansion pressure.

3,271,847
ADJUSTABLE STOP MEANS FOR PLIERS
Melvin Millheiser, Rockaway, N.Y., assignor to Waldes Kohinoor, Inc., Long Island City, N.Y., a corporation of New York
Filed Feb. 2, 1965, Ser. No. 429,757
6 Claims. (Cl. 29—229)



1. A pliers for assembling and disassembling split spring retaining rings comprising, in combination, a pair of lever arms having hub-like portions intermediate their ends and being pivotally connected for relative angular motion by a pivot passing through said hub portions, the ends of the arms extending to one side of said hub portions terminating in tips adapted to be inserted in the apertures conventionally provided in the free ends of said split retaining rings to be assembled and disassembled and the ends of the arms extending to the other side of said pivot mounting handles, spring means operatively associated with said handles for normally maintaining same in said spread-apart position, and stop means for limiting the maximum permissible spacing of said tips comprising a set screw-slide nut combination adjustable along a longitudinal slot provided in the hub portion of one lever arm and adapted to be secured in a desired position of adjustment therealong, and abutment-edge means on the hub portion of the other lever arm normally spaced from the set screw but adapted to abut said set screw and thereupon to prevent relative angular motion of said hubs and working tips in one direction, the construction and arrangement being such that said set screw-slide nut combination and said abutment edge means is encompassed within the dimensional confines of said hub portions.

3,271,848
PROCESS AND APPARATUS FOR DETACHABLY FIXING A DEVICE ON A MACHINE AND INSTALLATION FOR PUTTING THIS PROCESS INTO PRACTICE

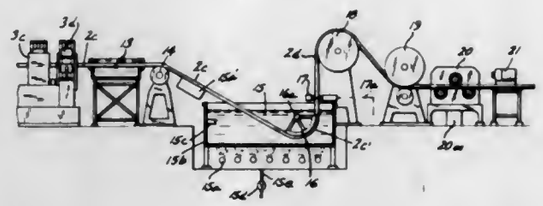
Louis Montandon, Loveresse, Bern, Switzerland, assignor to Boillat S.A., Reconvilier, Switzerland

Filed Aug. 15, 1963, Ser. No. 302,384
Claims priority, application Switzerland, Aug. 25, 1962, 10,131/62; June 1, 1963, 6,905/63
19 Claims. (Cl. 29—407)

1. A process for removably fixing a device on a machine in a prescribed position, comprising providing a pair of complementary brackets, said pair of brackets including a male bracket having trued prisms on its one end face with the trued prism surfaces inclined relatively to the general plane of said free end face and a female bracket having trued prismatic grooves of a shape complementary to the said trued prisms on its one end face and inclined relatively to the general plane of said one end face, fixing the one of said brackets to the machine in a perfectly specified position relatively to the machine and with its said end face fully accessible, fixing said device on the other of said brackets in a perfectly specified position relatively to said other bracket and with said end surface of said other bracket fully accessible, interconnecting said brackets with their complementary end faces engaging each other without clearance, the relative position of said brackets being thereby perfectly specified in three dimensions, the position of said device on the machine being thus perfectly predetermined by fixing it on said other bracket in a perfectly specified position and by interconnecting said brackets in a perfectly specified relative position.

3,271,849
IRIDIUM-SHEATHED WIRE FOR ELECTRON TUBES

Edward George Price, Chiswick, London, England, assignor to The International Nickel Company, Inc., New York, N.Y., a corporation of Delaware



No Drawing. Filed Nov. 8, 1963, Ser. No. 322,541
Claims priority, application Great Britain, Nov. 26, 1962, 44,639/62
3 Claims. (Cl. 29—420.5)

1. A process for making iridium-sheathed wire especially adapted for use as grid wire in a high power electron tube comprising compacting and sintering iridium powder into a tube having outside and inside diameters in a ratio from 5:3 to 2:1, a Vickers Diamond Penetration hardness of 220 to 310 and a sintered density from 16 grams per cubic centimeter to 20 grams per cubic centimeter, providing a rod of metal characterized by tensile strength of 5000 pounds per square inch to 12,000 pounds per square inch and selected from the group consisting of sintered tungsten, swaged molybdenum containing up to about 0.5% titanium and swaged and drawn molybdenum containing up to about 0.5% titanium, fitting said metal rod into said iridium tube to make a filled tube, hot swaging said filled tube at about 1450° C. to about 1550° C. and then hot drawing the filled tube at about 500° C. to about 750° C. to wire.

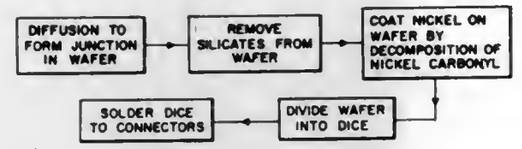
3,271,850
PROCESS AND APPARATUS FOR THE PRODUCTION OF PLATED PIPE

Heinrich Menne and Wolfgang Weinreich, Paderborn, Germany, assignors to Benteler-Werke A.G., Schloss Neuhaus, Germany

Filed Oct. 2, 1963, Ser. No. 313,246
Claims priority, application Germany, Oct. 4, 1962, B 69,083
32 Claims. (Cl. 29—460)

1. A process for the production of internally plated small-caliber metallic pipe, comprising the steps of advancing a continuous length of metallic pipe endwise along an elongated path, an intermediate portion of which path is disposed at a level below the portions which are located upstream and downstream of said intermediate portion; feeding a nonferrous plating metal into the interior of the pipe upstream of said intermediate portion of the path so that the plating metal advances toward said intermediate portion; and heating that section of the pipe which advances along said intermediate portion of the path to a temperature which is sufficient to maintain the plating metal in molten condition whereby the plating metal forms in the interior of said pipe section a pool and automatically coats the pipe so that the pipe emerging from said intermediate portion of the path is plated along the internal surface thereof.

20. An apparatus for the production of plated small-caliber metallic pipe, comprising means for producing a continuous length of pipe; means for advancing the pipe end-wise along an elongated path an intermediate portion of which path is disposed at a level below the portions which are located upstream and downstream of said intermediate portion; means for feeding a plating metal into the advancing pipe at a point upstream of said intermediate portion so that the metal advances toward said intermediate portion; and means for heating that section of the pipe which advances along said intermediate portion so that the plating metal melts to form a pool of molten plating metal which remains in said intermediate portion of the path and to automatically coat the internal surface of the pipe.



3,271,851
METHOD OF MAKING SEMICONDUCTOR DEVICES

Robert G. Hays, Scottsdale, Ariz., assignor to Motorola, Inc., Franklin Park, Ill., a corporation of Illinois

Continuation of application Ser. No. 251,421, Jan. 14, 1963. This application June 7, 1965, Ser. No. 461,936
7 Claims. (Cl. 29—492)

1. A process for making an ohmic connection between a semiconductor element of silicon and a metal member, including the steps of, treating a silicon semiconductor element to remove oxides and silicates by at least one treatment selected from the group consisting of sand blasting and washing in a solution containing hydrofluoric acid, depositing a flash film of nickel from gaseous nickel carbonyl on a surface of the semiconductor element to a thickness of between 1 and 20 microinches, subsequently dividing said element into semiconductor die units, assembling individual ones of said die units with solder and metal connector members, and soldering said members to said die units by heating and then cooling

the assemblies to melt and solidify the solder with said nickel plating being sufficiently thin to act as a wetting

agent for the solder to facilitate soldering to the silicon die units.

3,271,852
METHOD AND COMPOSITION FOR EXOTHERMIC BRAZING OF METAL JOINTS

Roger A. Long, San Diego, Calif., assignor to Whittaker Corporation, a corporation of California

No Drawing. Continuation of application Ser. No. 686,870, Sept. 30, 1957. This application Sept. 6, 1963, Ser. No. 306,993
17 Claims. (Cl. 29—494)

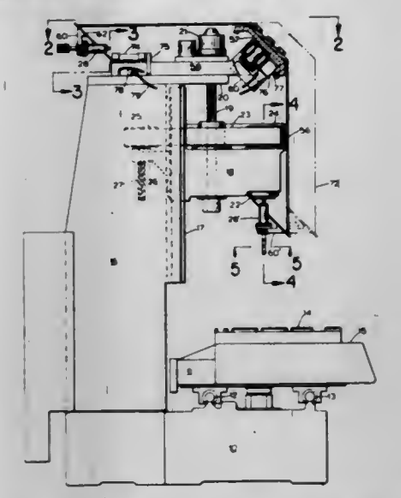
1. An exothermic brazing composition comprising a mixture of at least two metal oxides and a hydride reducing agent, said metal oxides and said hydride reducing agent being present in proportions which will react exothermically to substantially completely reduce said oxides to native metals while liberating hydrogen and to generate sufficient heat to cause said native metals to flow.

5. A method of brazing two metal pieces comprising placing a material comprising a mixture of a plurality of metal oxides and a hydride reducing agent capable of generating hydrogen protective gas in close proximity to the area of the metal pieces, the metal oxides and hydride reducing agent in said mixture being present in proportions which will react exothermically to substantially completely reduce the oxides to native metals and generate sufficient heat to cause said metals to flow; heating the material to a temperature below that necessary for brazing the materials but sufficient to initiate a reaction in said mixture; cleaning the metal pieces with the hydrogen gas formed by said reaction; allowing said reaction to continue until the heat produced by the reaction is sufficiently high to braze the metal pieces; and cooling said metals to solidify the braze, whereby substantially no residue other than a braze alloy remains.

3,271,853
AUTOMATIC TOOL CHANGING MECHANISM FOR MACHINE TOOL

Stanley A. Pfister, Wilmington, Ohio, assignor to The Cincinnati Milling Machine Co., Cincinnati, Ohio, a corporation of Ohio

Filed Jan. 26, 1965, Ser. No. 428,086
5 Claims. (Cl. 29—568)



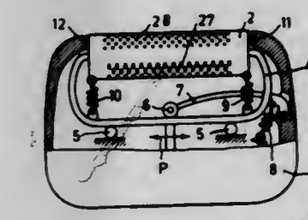
1. Apparatus for interchanging a selected one of a plurality of cutting tools in a machine tool comprising in combination:

(a) a spindle rotatable on a fixed axis and adapted to receive and releasably hold each of the cutting tools when inserted axially into said spindle,

(b) means for supporting said cutting tools in a circular array around said spindle with the longitudinal axis of each cutting tool lying along the slope of a conical surface,

(c) means for rotating said circular array of tools through a series of positions in each of which series of positions one of the tools defining the selected tool is oriented with its longitudinal axis parallel to the fixed axis of said spindle,

(d) means for shifting said circular array of tools in a direction transverse to said spindle to shift said selected tool to and from a position wherein the longitudinal axis thereof is coincident with the fixed axis of said spindle, and



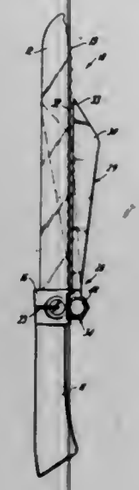
(e) means for moving said spindle along the fixed axis thereof for insertion of the selected tool therein.

3,271,854
RECIPROCATING DRY SHAVER WITH MOVABLE SHEAR PLATE AND ADDITIONAL CUTTING MEANS

Gerrit Starre, Drachten, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware

Filed Jan. 24, 1964, Ser. No. 339,916
Claims priority, application Netherlands, Feb. 21, 1963, 289,315
3 Claims. (Cl. 30—34.1)

1. A dry shaver comprising a housing, a reciprocable cutting member, a relatively thin, cylindrical shear plate having spaced groups of apertures therein, said cylindrical shear plate being constituted of a pair of flexible portions, a common fillet between a pair of side edges of said flexible portions whereby said flexible portions are supported at an angle relative to each other and are bowed outwardly, a toothed hair-clipping blade projecting from said side edges of said flexible portions and coupled to said reciprocable cutting member, and a projecting edge of said fillet being provided with teeth which co-act with said toothed hair-clipping blade, a pair of abutments on said housing, means supporting said shear plate between said abutments whereby said shear plate is prevented from displacement along its longitudinal axis but is adapted to move at right angles to said axis, said supporting means for said shear plate being solely said reciprocable cutting member mounted within said cylindrical shear plate, and resilient biasing means connected to said shear plate whereby the latter is held in engagement with the cutting member.



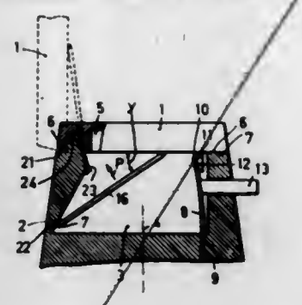
3,271,855
SLICING KNIFE

Henry J. Stolbach, 176 E. 77th St., New York, N.Y.

Filed Mar. 20, 1964, Ser. No. 353,405
10 Claims. (Cl. 30—283)

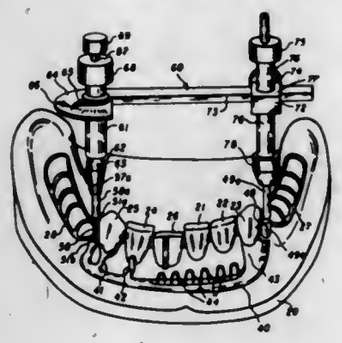
1. An adjustable guide slicing knife comprising a handle, a longitudinally extending slicing blade affixed to and projecting forwardly of said handle, a longitudinally

extending guide arm transversely spaced from and parallel to said slicing blade and terminating at its rear in a bracket section, a transversely extending screw member supported by said bracket section, an internally-threaded



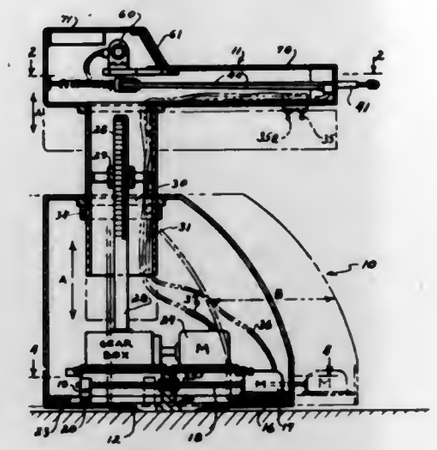
collar member mounted on said handle and engaging said screw member for movably mounting said bracket section on said handle, and means for rotating one of said members relative to the other member whereby to transversely adjust said guide arm.

3,271,856
KITCHEN IMPLEMENT HANDLE
Charles A. Rowley, 7803 E. Harper, Downey, Calif.
Filed Apr. 20, 1964, Ser. No. 361,107
4 Claims. (Cl. 30—343)



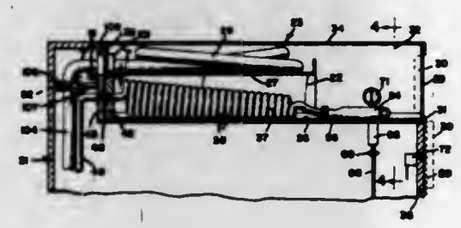
1. The combination with a kitchen implement having a metallic shank with a lower end and an upper end, of an elongated handle of a translucent material having a socket extending inwardly from one end thereof, the upper end of said shank being secured in said socket, said translucent handle having flecks of light-reflecting material dispersed therethrough beneath the outer surface thereof, the translucency of the material of said handle and the diffusion of light by said flecks of light-reflecting material being such that visibility of said upper end of the shank is obscured.

3,271,857
DRY RAZOR HAVING A SPRING MEANS TO OPEN THE RAZOR HEAD
Johannes Hubertus Poletiek, Drachten, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Mar. 3, 1964, Ser. No. 348,942
Claims priority, application Netherlands, Mar. 6, 1963, 289,891
4 Claims. (Cl. 30—41.6)



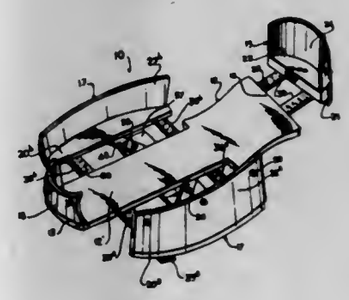
1. A shaving head for a dry shaver having a housing and including a shear plate adapted to swing open from a normally closed horizontal position to an open, generally vertical position, said housing being provided with an inclined wall, means mounting said shaving head on the housing of said dry shaver with the peripheral lower edge thereof abutting and engaging a portion of the edge of the opening of said housing, said means comprising a spring having one end secured to the underside of said shaving head and another portion thereof freely and slidably engaging the inclined wall of said housing, the moment of force on said spring being so directed by said inclined wall that the shaving head is swung open when said portion of the spring slides up said inclined wall.

3,271,858
REMOVABLE DENTAL APPLIANCES AND METHODS OF MAKING SAME
Joe J. Simmons, Dallas, Tex., assignor to Idea Development Company, Dallas, Tex., a corporation of Texas
Filed Jan. 28, 1964, Ser. No. 340,635
25 Claims. (Cl. 32—5)



1. A dental appliance including: a lingual section adapted to engage an abutment tooth; a labial bar adapted to engage said abutment tooth; a first hinge member carried by said lingual section; a second hinge member carried by said labial bar at one end thereof and hingedly secured to said first hinge member whereby the free end of said labial bar may swing with respect to said lingual section; and a latch member carried by said lingual section and a catch member carried by the free end of said labial bar and engageable with said latch member of said lingual section for releasably securing said free end of said labial bar to said lingual section to clamp the abutment tooth therebetween.

3,271,859
DENTAL EQUIPMENT STAND
Norman Horowitz, 111—21 77th Road, Forest Hills, N.Y., and Philip Spigner, 1460 Park St., Atlantic Beach, N.Y.
Filed Sept. 7, 1962, Ser. No. 222,127
3 Claims. (Cl. 32—22)

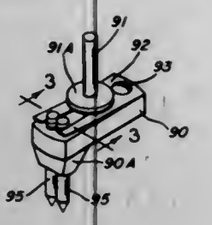


1. A dental equipment stand comprised of a base portion, a head portion mounted on said base portion to receive the dental equipment, said head portion having a pedestal extending therebelow fitting within a collar at the top of said base portion, first means in association with said base portion to move said base portion in a substantially horizontal plane, and second means in cooperative association with said base portion and said pedestal of said head portion to vertically move said head portion relative to said base portion, wherein said first means includes a stand within said base portion resting on the ground, the remainder of said base portion resting on said stand, and motor means within said base portion, actuating connections between said motor means and said stand, said motor means and said actuating connections effecting movements relative between said stand and said base portion, and switch means on said head portion for energizing said motor means.

3,271,860
CABINET HAVING STERILIZABLE INSTRUMENT TRAY
William E. Burton, 616 Ventura Ave., San Mateo, Calif.
Filed May 7, 1965, Ser. No. 453,929
10 Claims. (Cl. 32—22)

1. In a container for sterilizable instruments, a tray, support means for supporting said tray, a first manifold positioned in said support means, a first port in said first manifold, at least one source of fluid under pressure differential for an instrument located in said support means and terminating in said first port, a second manifold on said tray, a second port in said second manifold, means for removably interconnecting said first and second ports, means mounting said tray in said support means with said first and second ports in registry, an extensible and contractable instrument conduit in said tray connected to said second port at one end and adapted for connection and transmission of fluid under pressure differential to an instrument at its end opposite said second port, and a cover for said tray enclosing said instrument, second manifold and conduit, whereby said tray, conduit, and second manifold may be sterilized and then kept in a sterile state when said cover is closed and said instrument conduit may be partially withdrawn from said tray by extension of said conduit when said cover is opened.

3,271,861
PORTABLE DEMONSTRATION SHOE MEASURING DEVICE
Rosario Fusco, 34 Kentucky St., Long Beach, Long Island, N.Y. 11561
Filed Dec. 9, 1963, Ser. No. 328,958
8 Claims. (Cl. 33—3)

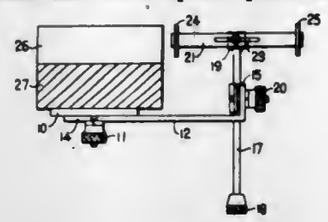


1. A device for measuring a person's foot, comprising a main central section, a heel portion, and two side portions defining a generally shoe-shaped structure; said central section having a flat, elongated generally rectangular main sole, and an upstanding curved flange wall at one end of said sole defining a toe for said structure; said heel portion having a first sole portion, and an upstanding curved other flange wall at the rear end of said sole portion defining a back for said structure; said side portions each having an elongated other sole portion, and an upstanding curved further flange wall defining a side for said structure; and a linkage assembly movably connecting said heel portion and side portions to said sole for adjusting said structure in length and width, said linkage assembly comprising a first pair of links secured to said first sole portion, a pair of trackways secured to and longitudinally of said main sole and slidably receiving said first links for guiding said heel portion in movement lengthwise of said main central section; a second pair of links secured respectively to forward ends of said other sole portions, a second trackway secured to and transversely of said main sole near said one end thereof and slidably receiving said second pair of links respectively, a third pair of links secured to rear ends of said other sole portions, a third trackway secured to and transversely of said main sole near the other end thereof and slidably receiving said third pair of links respectively, whereby the side portions are guided in movement laterally with respect to said main central section, a fourth pair of links pivotally connected together by a pin at rear ends thereof, forward ends of said fourth links being connected respectively to intermediate points of said other sole portions, said main sole having a longitudinally extending groove slidably receiving said pin to guide said fourth links, a cross bar extending transversely of said main sole, said cross bar having a central slot, two other pins respectively engaged with said fourth pair of links and slidably disposed in said central slot, and a third other pin engaged in said central slot and said groove, whereby the side portions are prevented from twisting in the plane of said main sole when the side portions are moved laterally with respect to said main central section.

3,271,862
SCRIBING INSTRUMENTS

Charles H. Stein, Westwood, and William Krause, Secaucus, N.J., assignors to Keuffel & Esser Company, Hoboken, N.J., a corporation of New Jersey

Original application Apr. 20, 1961, Ser. No. 104,482. Divided and this application Mar. 1, 1965, Ser. No. 443,743
9 Claims. (Cl. 33—18)

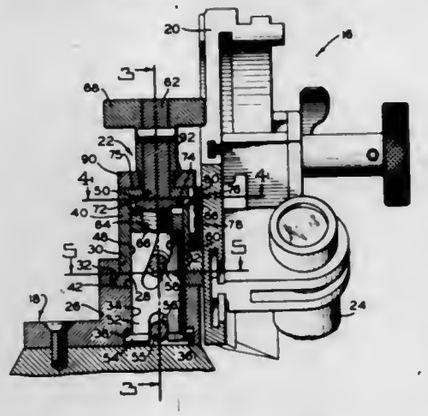


1. A scribing device for simultaneously making two lines in substantially parallel relation comprising a first L-shaped body, a second L-shaped body hingedly connected to said first L-shaped body adjacent the free end of corresponding legs by a pivot stud parallel to the planes of the L-shaped bodies whereby the other legs remain parallel and are movable toward and away from one another, a tubular support shank fixedly mounted on said first L-shaped body for support of the instrument from a lead holder or clamp, a shouldered shaft rotatably mounted in said tubular support shank providing for pivotal support of said scribing instrument on a lead holder or clamp secured to said shouldered shaft, means to secure said shaft against axial displacement in said tubular support shank while permitting rotative movement therein, resilient means normally urging the other legs of said L-shaped body together, means to positively and adjustably separate said other legs of said L-shaped bodies, said other legs of said L-shaped bodies being provided with scribing element receiving bores therein open at both ends with said bores being of restricted size at the free extremity of said second legs whereby a shouldered scribing element will be retained in said bores while permitting longitudinal movement thereof, a leaf spring mounted on said first body and having leaf spring elements overlying said bores and engageable with said scribing elements urging said scribing elements outwardly towards said reduced ends of said bores, a guide stud portion integral with said pivot stud projecting in the direction of said other legs whereby the scribing element in said one L-shaped body and said guide stud portion may engage a guide edge for accurately guiding said instrument in a predetermined path, said separating means providing for changing the angular relation between said L-shaped bodies and thereby changing the spacing between the scribing elements and the bores scribed thereby so that parallel lines may be simultaneously scribed in one operation.

3,271,863
BOW SIGHT

Charles M. Harrington, 1107 W. Pine St., Hattiesburg, Miss.

Filed Oct. 6, 1964, Ser. No. 401,792
2 Claims. (Cl. 33—46)

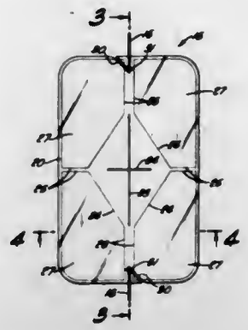


1. A bow sight of the character described, comprising a square plate to the center of which is secured one end of an arm that has its other end formed at right angles thereto, and terminating in a U-shaped holding member that adjustably supports a structure embodying a pair of spaced sights one of which is equipped with a horizontally disposed hair-line, and the other of which is equipped with a vertically disposed hair-line and said arm being secured to said square plate by means of a knurled head screw, and said bow sight being secured to the handle of a bow by means of screws passing through said square plate and said square plate having a horizontal line having an arrow thereon that is in alignment with the marking on the peripheral face of said disk-like member of said arm.

3,271,864
AZIMUTH ADJUSTMENT DEVICE WITH LOCK FOR FIREARM SIGHTS

John G. Rocha, Westfield, Mass., assignor to the United States of America as represented by the Secretary of the Navy

Filed Mar. 17, 1964, Ser. No. 352,696
3 Claims. (Cl. 33—56)

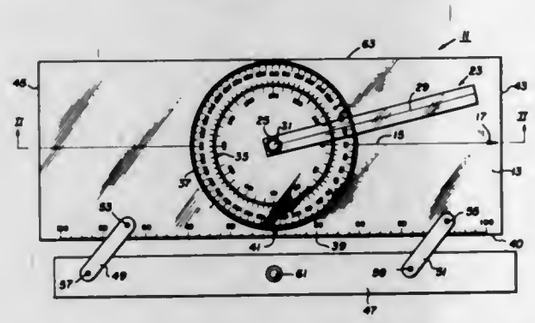


1. A firearm sight having a base plate, a mount mounted on said base plate for rotational displacement respective thereto around a vertical axis, a sector member fixed to one side of said mount, a sight tube mounted on said sector member for calibrated range adjustment, an azimuth adjustment device having a pintle received by a mating hole in said mount and a bore in said base plate so as to act as a bearing for the rotational displacement of said mount and means for adjustably rotating said mount around said pintle, and means for releasably locking said mount at its adjusted position including a transverse pin through said base plate slidingly received by a vertical slot in said pintle to prevent rotation thereof respective to said base plate, means for displacing said pintle vertically, a pair of cam slots formed in said pintle, and a pair of cam followers on said mount having sliding engagement with said cam slots for converting vertical displacement of said pintle to rotational displacement of said mount.

3,271,865
SURVEYOR'S TARGET

Roger D. Glidden, 708 Bettyhill Ave., Duarte, Calif., and Charles E. Glidden, 1231 Lyman Ave., Glendora, Calif.

Filed July 2, 1964, Ser. No. 379,945
5 Claims. (Cl. 33—74)

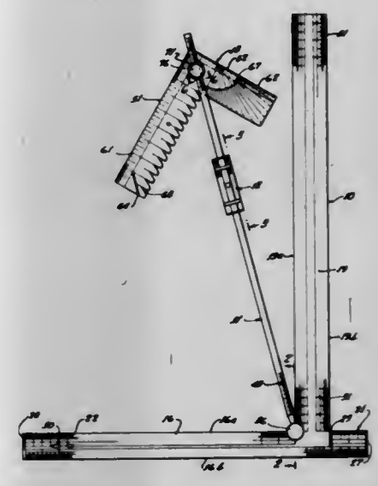


1. A surveyor's target for use on a plumb line, said target comprising a plaque of stiff plastic material, said plaque being divided into opaque areas and other areas of transparent-fluorescent material so arranged relative to said opaque areas as to facilitate alignment of the cross-hairs of a sighting instrument thereon with the vertical cross hair coincident with a plumb line, said plaque being substantially transparent throughout the thickness of said transparent-fluorescent areas whereby the latter are activated in the daytime by the light rearward thereof, and said transparent-fluorescent area lying generally centrally of said plaque and including two pairs of corners aligned, respectively, with the vertical and horizontal center lines of said plaque.

3,271,866
POSITION LOCATOR FOR AIRPLANES AND THE LIKE

Leslie G. Gruber, 4530 Shady Grove Road, Memphis, Tenn., and Lynton L. Scharff, 3001 Ozark Ave., Little Rock, Ark.

Filed Jan. 3, 1962, Ser. No. 163,982
5 Claims. (Cl. 33—75)



1. A position locator for locating the position of an airplane and the like on navigational charts and maps from readings indicated on ADF and/or Omni instruments and by the compass carried by the airplane and the like, said position locator comprising a transparent base plate having a base plate azimuth scale reading from zero degrees to 360 degrees and having a center line extending longitudinally of said base plate in alignment with the zero line of said base plate azimuth scale and having an arrow thereon pointing outwardly from the zero line, a transparent disc having a disc azimuth scale reading from zero degrees to 360 degrees, said disc azimuth scale being subdivided into an inner scale and an outer scale, an elongated transparent pointer having an index line thereon; means having a bore therethrough rotatably mounting said disc and said pointer on top of said base plate for 360 degree rotation of said disc and said pointer, respectively, relative to said base plate with the center of the bore coinciding with the centers of said base plate azimuth scale and said disc azimuth scale, with said index line, if extended, intersecting the center of the bore, and with said inner scale being adjacent said base plate azimuth scale, said disc and said pointer being supported by said base plate with said base plate being adapted to rest on navigational charts and maps whereby said disc and said pointer are rotatable relative to the navigational charts and maps; said base plate having a distance scale thereon with the zero point thereof being opposite the center of said bore and increasing in readings in opposite directions therefrom, a ruler and a pair of arms of equal length pivotally connected adjacent opposite ends thereof respectively to said ruler and said base plate whereby said ruler is adapted to be moved in parallel relationship to said base plate.

3,271,867
COMBINATION LAYOUT TOOL

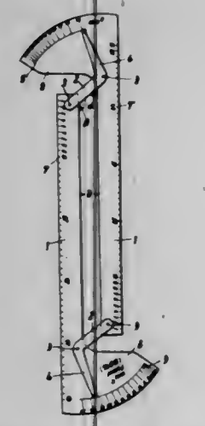
Ralph C. Morris, 1572 Hazelwood Ave., Los Angeles, Calif.

Filed Sept. 30, 1964, Ser. No. 400,344
5 Claims. (Cl. 33—94)

1. A combination layout tool comprising, in combination:
(a) a base member;
(b) an upright arm member perpendicularly and integrally mounted on said base member to form a first square;
(c) each of said members having parallel inner and outer edges which intersect at right angles with an apex at the intersection of said inner edges and each member having at least one scale thereon;
(d) a rotating arm member pivoted coincident with said apex and having a scale with zero indexed at said apex formed thereon;
(e) a second relatively small square slideably and movably connected to said rotating arm and having scaled inner and outer edges with protracting means and spacing means provided thereon;
(f) means to read out the interior angle between said rotating arm member and said base member;
(g) marking means slideable on said rotating arm for positioning it at different predetermined scale positions along the arm intermediate said first and said second squares;
(h) guide means associated with said first square to permit it to move along a work piece; and,
(i) a measuring aperture formed in said base member adjacent said upright arm member and extending across said base member to said guide means.

3,271,868
DEVICE FOR MEASURING TWO-DIMENSIONAL REPRESENTATIONS

Gerhard Küntscher, Hamburg-Blankenese, and Benno Lotz, Kiel, Germany, assignors to Ortopedia Gesellschaft mit beschrankter Haftung, Kiel-Dietrichsdorf, Germany



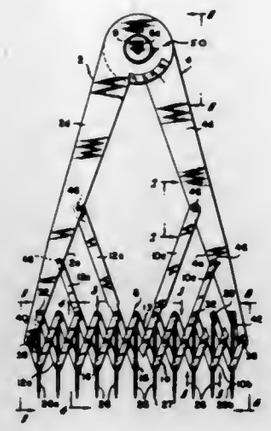
Filed Mar. 3, 1964, Ser. No. 349,068
Claims priority, application Germany, Aug. 7, 1963, O 9,602
3 Claims. (33—143)

1. A measuring instrument for application to an X-ray photograph of an anatomical bone, and for directly indicating both the true dimensions of the X-ray photographic image, and the corrected dimensions of said

bone, allowing for the enlargement factor due to the central projection distortion resulting from the X-ray technique, said instrument comprising:

(a) a pair of elongated, flat ruler-like legs carrying respective lengthwise scales of true photographic length and of corrected actual length, and each leg having at one end thereof an integral, arcuate enlarged scale-bearing extension which is coplanar with and extends lengthwise beyond the body of said leg;

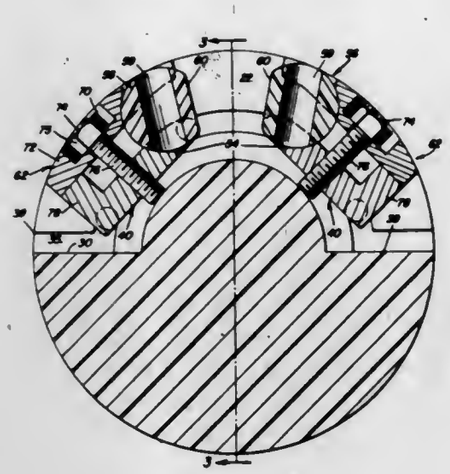
(b) a pair of shorter flat links respectively pivotally connected at one end of each said link to a point near one end of each of said respective legs which is at the arc center of its said extension, said links being respectively pivotally connected at the other end of each such link to a point near the opposite



end of each respective leg, to form with said legs a shiftable parallelogram;

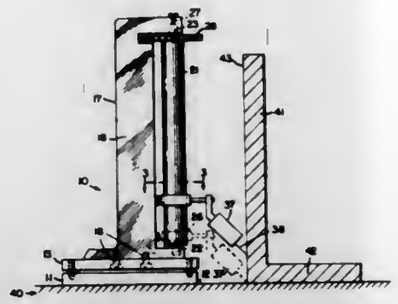
(c) each of said links having an integral pointer element adapted to move along a respective arcuate scale marked on the corresponding one of said extensions, as said parallelogram is shifted, the relation of the pointer element length to the scale factor of each arcuate scale being such as to provide, at the respective arcuate scales, simultaneous indications both of true photographic width and of corrected actual width of the bone as measured on said photograph between the facing edges of said legs, when said device is applied to the photograph with the facing edges of said legs overlying the longitudinal margins of the image of the bone.

3,271,869
PRECISION SPACING DIVIDERS
Nathaniel C. Ratner, 220 E. 63rd St., New York, N.Y.
Filed July 15, 1965, Ser. No. 472,080
9 Claims. (Cl. 33—151)



1. Proportional divider apparatus, comprising

a pair of pivotally connected legs (**2, 4**); and lazy tong means (**8**) connected between said legs, comprising a plurality of coplanar first links (**10**) extending generally parallel with a first one (**2**) of said legs, a plurality of coplanar second links (**12**) extending generally parallel with the other of said legs (**4**), said first and second links being arranged in spaced parallel planes, respectively, means (**26, 32**) pivotally connecting at least some of said first and second links at the ends thereof adjacent the pivotal connection of said legs, respectively, said connecting means including a plurality of parallel linear elements (**26**) contained in a common plane between and parallel with the planes containing said first and second links, respectively, and a plurality of coplanar guide members (**16**) arranged between and pivotally connecting said first and second links at the ends thereof remote from the pivotal connection of said legs, respectively, at least some of said guide members containing bores



(**18**) slidably receiving portions of said linear elements, respectively.

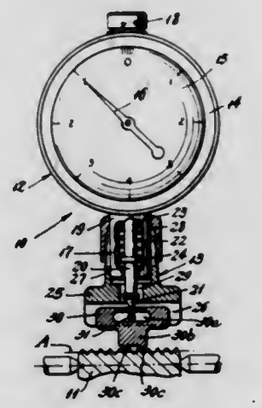
3,271,870
BOWLING BALL HOLE GAUGING DEVICE
David P. Blaker, P.O. Box 8, Elmore City, Okla., and Kenneth J. Conrad, 7387 Broadway, Lemon Grove, Calif.
Filed Mar. 17, 1964, Ser. No. 352,450
10 Claims. (Cl. 33—174)

1. A handgrip measuring device comprising a dummy bowling ball, a pair of spaced slots formed in said ball having walls parallel to perpendicular planes intersecting at the center of said ball, each of said walls being formed with arcuate grooves, finger stall assemblies adjustably positioned in said slots, each finger stall assembly including a seating element slidably mounted by the arcuate grooves between the walls of the slot, a replaceable insert seated on said seating element, and locking means mounted on said seating element for both locking the insert in position on the seating element and holding the seating element in adjusted position within the slot, said locking means comprising, an insert clamping member having an outer portion engaging the insert in spaced relation to the seating element and a bearing portion engaging the seating element spaced from the insert, and screw means contacting the bottom of the slot and operatively engaged with the clamping member and the seating element for drawing the seating element toward the clamping member.

3,271,871
TESTING INSTRUMENT
Valentino J. Foscarota, 25 Cleveland St., Somerville, Mass.
Filed Feb. 16, 1965, Ser. No. 433,047
7 Claims. (Cl. 33—174)

1. An inclination and flatness gauge comprising a base defining a lowermost plane,

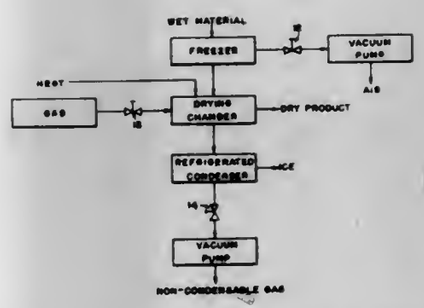
an upwardly extending support mounted on said base,



an upwardly extending elongated shaft mounted on said support, said support having axially spaced bearings for rotatably mounting said shaft about its longitudinal axis,

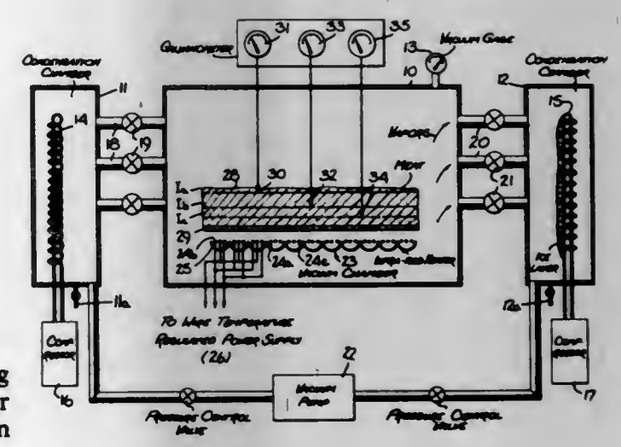
testing means mounted on said shaft for reciprocal movement along said shaft,

means interconnecting said base and said support for enabling perpendicular alignment of said shaft with respect to said plane of said base,



said testing means comprising an end mounted for rotation with said shaft about said axis and extending in one position to the lowermost plane for movement of said end over an arcuate path in said lowermost plane to tram said gauge.

3,271,872
DEVICE FOR CHECKING THREAD PITCH DIAMETER CONCENTRICITY
Lawrence J. Heslin, 28 Sunrise Road, Danbury, Conn.
Filed Sept. 17, 1963, Ser. No. 309,570
9 Claims. (Cl. 33—199)



1. An actuating attachment for a dial indicator having movable plunger operating means to adapt the indicator for checking thread pitch diameter concentricity of an independently supported and rotated workpiece; said attachment comprising means for rigidly connecting said attachment to said indicator operably adjacent said plunger operating means and means freely universally floatable relative to said plunger operating means in a plane parallel to the axis of rotation of the workpiece, said floatable means being in operable engagement with said plunger operating means and having means engageable with the thread pitch diameter at one side of the workpiece to be checked and at spaced intervals therealong for moving said plunger operating member in response to deviation in the thread pitch diameter concentricity as the workpiece is rotated.

3,271,873
METHOD AND APPARATUS FOR DRYING MATERIALS
John C. Harper, Rte. 1, Willowbank 11, Davis, Calif.
Filed Sept. 12, 1963, Ser. No. 308,385
9 Claims. (Cl. 34—5)

1. In a method for drying material the steps comprising: placing the material to be dried in a low pressure atmosphere containing a light gas selected from the group consisting of hydrogen and helium, supplying heat thereto, and adding a sufficient amount of said light gas to said atmosphere to overcome effectively the effect of air leakage to an extent necessary to maintain the ratio of light gas to air of not less than about 10% of said light gas in the total volume of said atmosphere.

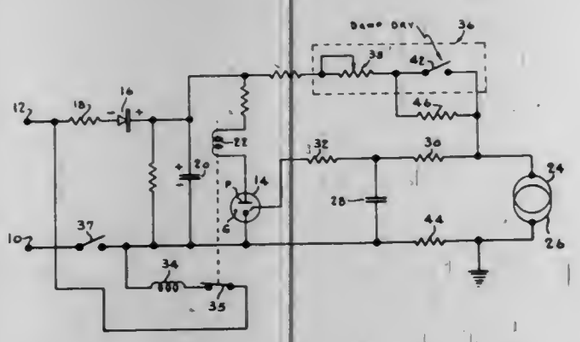
3,271,874
INFRA-RED SUBLIMATION METHOD AND APPARATUS FOR FREEZE DRYING TECHNIQUES
Franz Oppenheimer, deceased, late of Chicago, Ill., by Suzanne Bohnen Oppenheimer, executrix, 900 N. Michigan Ave., Chicago, Ill. 60611
Filed Jan. 28, 1965, Ser. No. 428,879
3 Claims. (Cl. 34—5)

1. The method of freeze-drying water-laden food within a vacuum chamber provided with an electrically-operated radiating device adapted to direct infra-red energy onto said food, said method comprising the steps of:

(a) reducing pressure in said chamber to effect evaporative cooling of said food to freeze same,

(b) supplying electrical power to the radiating device to produce infra-red energy to sublimate the water

of composition of the frozen food, the surface temperature of said device determining the band in the spectral region in which said energy is primarily radiated,



(c) varying the amount of power supplied to said device in the course of sublimation in accordance with the temperature of said food, and

(d) adjusting the radiating device to maintain the surface temperature thereof at a substantially constant level regardless of the amount of power supplied thereto in the course of sublimation, said level being such as to give rise to radiation in a band within said spectral region which provides optimum conditions of heat penetration and absorption to promote rapid sublimation without scorching of the food.

3,271,875
METHOD FOR STABILIZING UNSTABLE SUBSTANCES
Louis Rey, Les Cerisiers, France, assignor to l'Air Liquide
No Drawing. Filed May 5, 1965, Ser. No. 453,484
Claims priority, application France, May 11, 1964, 974,006, Patent 1,405,883
9 Claims. (Cl. 34—5)

1. A method for stabilizing substances alterable in the air, comprising the steps of diluting them in a liquid, cooling the diluted medium until the liquid solidifies, and separating out the solidified liquid by selective sublimation, the diluting liquid being at least a compound of the group consisting essentially of ammonia and carbon dioxide, and the halogenated hydrocarbons and the aliphatic amines of a freezing point substantially under 0° C.

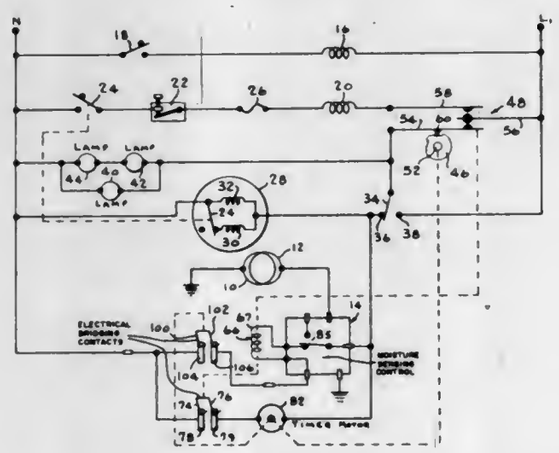
3,271,876
DRYER CONTROL DEVICE
Otto R. Behrens, Skokie, Ill., assignor to Controls Company of America, Melrose Park, Ill., a corporation of Delaware
Filed Nov. 20, 1962, Ser. No. 239,124
2 Claims. (Cl. 34—45)

1. A dryer control for use in combination with a pair of relatively spaced sensing members the leakage current across which is dependent on the amount of moisture contained in the articles being dried, said control comprising,

a thyratron tube,

rectifying means connected in circuit with and operative to apply a D.C. voltage to one of said members, said rectifying means also connected to the plate circuit of said tube for applying a predetermined D.C. voltage to said tube so that said tube is normally in a nonconducting state,

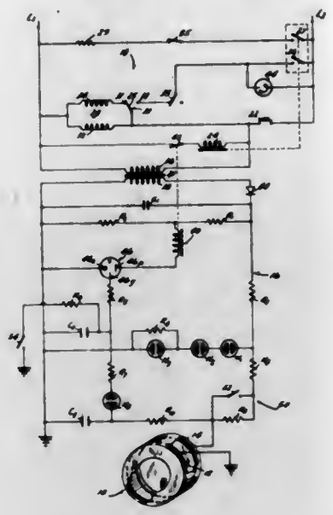
variable resistance means connected in circuit with said rectifying means and said sensing members for selectively adjusting the amount of resistance in the circuit to vary the voltage applied to said one sensing member, said variable resistance means including a rheostat, a fixed resistance and means for selectively bypassing said fixed resistance and connecting said fixed resistance in circuit with said rheostat,



control means in series circuit relationship with and controlled by said thyratron tube,

the grid circuit of said thyratron tube including one of said sensing members and being responsive to the potential across said sensing members,

filtering means in the plate circuit of said tube and in circuit with said one sensing member to filter the D.C. voltage applied to said tube and said one sensing member,



and capacitive means connected in said grid circuit between the grid of said tube and said one sensing member for effecting a time delay in the response of said tube to the potential across said sensing members whereby said tube is rendered conductive and actuates said control means when a potential corresponding to a predetermined moisture content of said articles appears across said sensing members.

3,271,877
DRYER CONTROL DEVICE AND TIMER
Robert F. Guenther, Jr., Elmhurst, and Ronald G. Martin, Chicago, Ill., assignors to Controls Company of America, Melrose Park, Ill., a corporation of Delaware
Filed Dec. 7, 1962, Ser. No. 243,001
20 Claims. (Cl. 34—45)

1. In a dryer, heat supply means, means for sensing moisture content and operative to establish a first dryer cycle based on said moisture content; timing means for establishing a second dryer cycle; control switch means in circuit with said heat supply means, said sensing means and said timing means, said control switch means having a first open position, a second position setting up a circuit to said sensing means and said timing means, and a third position setting up a circuit to said heat supply means, said sensing means and said timing means; said timing means including means engageable with said control switch means for selectively actuating said control switch means to and holding said control switch means in one of its three positions; second switch means in circuit with said timing means; and operating means for selectively opening and closing said second switch means; said sensing means connected in circuit with and controlling said operating means and being operative to respectively open and complete the circuit to said operating means simultaneously with initiation and completion of said first dryer cycle so that said timing means is de-energized during and is energized at the end of said first cycle to determine the period for movement of said control switch means from one of its three positions.

3,271,878
MOISTURE SENSING CONTROL
Ronald G. Martin, Chicago, Ill., assignor to Controls Company of America, Melrose Park, Ill., a corporation of Delaware
Filed Oct. 14, 1963, Ser. No. 315,934
20 Claims. (Cl. 34—45)

1. A moisture sensing control for use with apparatus for drying material and operative to control the heat supply means of said apparatus in accordance with the moisture content of said material, said moisture sensing control comprising, in combination,

sensing means including an electrode arranged for engagement with said material,

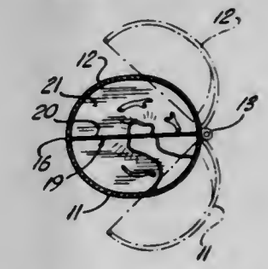
means for applying a D.C. voltage to said electrode with the voltage thereon varying in accordance with current leakage through said material so that the voltage on said electrode increases as the moisture content of said material decreases,

switch means for controlling energization of said heat supply means and having a switch-over voltage at which its operational state is changed to de-energize said heat supply means,

a neon lamp connected in circuit between said electrode and said switch means and having a switch-over voltage at which it is rendered conductive and below which it is non-conductive, the switch-over voltage of said neon lamp being below that of said switch means and the voltage on said electrode at the initiation of the drying operation being below the switch-over voltage of said neon lamp so that said switch means is electrically isolated from said electrode and is in a first operational state,

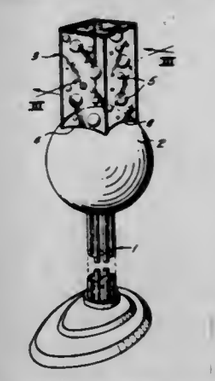
capacitive means connected in circuit with said neon lamp and electrode for receiving and storing a charge from said electrode and characterized by having a capacity at least equal to the switch-over voltage of said neon lamp,

and capacitive means connected in circuit between said neon lamp and said switch means and characterized by having a capacity at least equal to the switch-over voltage of said switch means.



3,271,879
BRAIN AND NERVOUS SYSTEM MODEL
Arthur M. Sackler, 18 Searington Road, Roslyn, Long Island, N.Y.
Filed Mar. 2, 1964, Ser. No. 348,573
16 Claims. (Cl. 35—17)

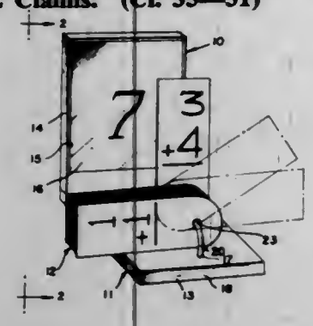
1. An anatomical display device comprising a base carrying indicia corresponding to anatomical members, a brain model mounted on said base and including a plurality of longitudinally spaced panels carrying representations of corresponding brain sections, and nerve represent-



ing line elements extending from said indicia to respectively related points on said brain section representations.

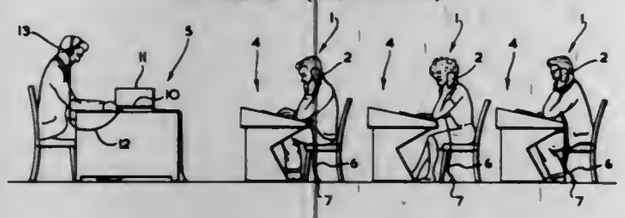
3,271,880
MODEL OF LIFE FORM
Arthur M. Sackler, 18 Searington Road, Roslyn, Long Island, N.Y.
Filed Mar. 2, 1964, Ser. No. 348,575
11 Claims. (Cl. 35—17)

1. An anatomical model comprising a hollow body in the shape of a life form, said body including at least two separable wall portions pivotally connected, at least a portion of one wall of said body being transparent, and an insert member dimensioned to fit within said wall portions in the closed position and visible through said transparent portion, said insert member including a first longitudinal sheet and a second transverse sheet intersecting said first sheet along a line extending transverse said first sheet, said sheets bearing anatomical features of said life form.



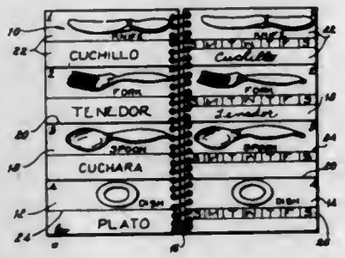
3,271,881
TEACHING AID
David N. Wagnon, 4005 Modlin St., Mesquite, Tex.
Filed Mar. 4, 1964, Ser. No. 349,433
11 Claims. (Cl. 35—19)

1. In combination with a static electricity generator having a sphere thereon, a housing made of transparent material positioned on the upper surface of the sphere



and having an open lower end, with edges conforming to the surface of the sphere; a plurality of free members in the housing having surfaces thereon of conducting material.

3,271,882
FLASH CARD GAME AND STAND
Ruth G. Chuy, 15447 Sorrento, Detroit 27, Mich.
Filed May 21, 1964, Ser. No. 369,140
2 Claims. (Cl. 35—31)

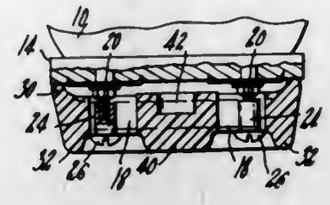


1. A device of the class described comprising: a plurality of flash card type cards; each of said cards being provided with a rounded lower end and a centrally located annular opening through said lower end; a platform having a plate on one end projecting vertically upward for vertically mounting a mirror thereon; an L shaped card supporting rod; said platform being provided with an opening spaced from said plate for mounting one end of a vertical portion of said L shaped rod; the other horizontal portion of said L shaped rod extending toward said mirror and being disposed in parallel relationship to and spaced above said platform for mounting said flash cards thereon by means of said central openings for forming a rotatable axis for said flash cards, whereby each of said flash cards may be rotated selectively from a horizontal inoperative position to a vertical operative position; said flash cards having their rear faces facing said mirror; printed means carried on the front faces of said flash cards for displaying problems; and, printed means carried on the rear faces of said flash cards for showing the answers to problems appearing on the front faces of said flash cards in cooperation with said mirror.

3,271,883
LANGUAGE LABORATORY APPARATUS
Harold A. Freeman, % McMaster University, Hamilton, Ontario, Canada
Filed June 17, 1963, Ser. No. 288,120
1 Claim. (Cl. 35—35)

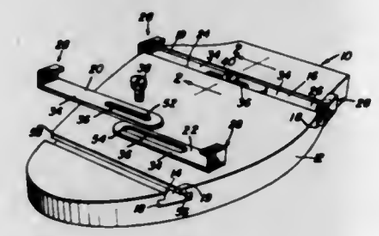
A language laboratory comprising an unpartitioned room having a teacher station and a plurality of student stations where the voice of a teacher at the teacher station is clearly audible to the unaided ear, a curved speaking tube at each student station and of a size that can be held in one hand, the speaking tube comprising a hollow sound conduit having an open end that can be positioned close to a student's mouth with an opposite end held to one of his ears while leaving his other ear unobstructed to hear the teacher's voice unaided, the conduit apart from said open ends being closed to conduct the student's voice along the hollow conduit from his mouth to his said one ear so that his voice is clearly audible to him but substantially inaudible at the other student stations, the first mentioned open end being sufficiently large substantially to cover the student's mouth with his nose outside the tube, a microphone in each conduit for picking up the student's voice, electrical means for transmitting the student's voice from the microphone to the teacher station, an earphone at the teacher station, and means at the teacher station for selectively connecting the earphone to the electrical means from the different student stations whereby each student's voice can be clearly heard by the teacher but not by other students.

3,271,884
MEANS OF TEACHING A FOREIGN LANGUAGE
Robert E. Roberson, 507 E. Zion Place, Tulsa, Okla.
Filed Nov. 25, 1964, Ser. No. 419,627
4 Claims. (Cl. 35—35)



1. A teaching aid device for facilitating the self-instruction of a foreign language and which comprises a plurality of sheets, a circular binding means connecting the plurality of sheets whereby one portion of the sheets may be rotated through three hundred and sixty degrees with respect to the remaining portion of the sheets, each of said sheets being provided with information on each side thereof relating to the foreign language and a basic language corresponding thereto, said information being arranged in facing sheets with one of said facing sheets being provided with a column of basic words and a column of corresponding foreign words with each basic word being arranged in substantial alignment with the corresponding foreign word, the other of said facing sheets being provided with a column of basic words arranged in substantial alignment with a column of blank spaces, the basic words and blanks on the second mentioned facing sheet being in substantial alignment with the basic words and foreign words on the first mentioned facing sheet, said circular binding providing for positioning of each corresponding pair of facing sheets in substantial back to back relationship for facilitating self-testing of the learned words, independent opaque mask means slidably movable with respect to the sheets, said mask means comprising a substantially flat body portion having an outwardly extending tab provided on one edge thereof, said tab being arranged for obscuring the words of one column and permitting visual observation of the aligned word in an adjacent column, a plurality of recording sheets secured to the mask means in a manner permitting a three hundred and sixty degree rotation of the recording sheets whereby the recording sheets may be disposed on either of the opposed flat surfaces of the mask means.

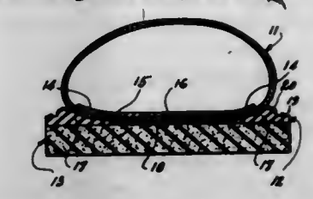
3,271,885
HEEL FOR ATHLETIC SHOE
Timothy L. McAuliffe, 101 Monmouth St., Brookline, Mass.
Filed Apr. 22, 1964, Ser. No. 361,715
10 Claims. (Cl. 36—2.5)



10. A football shoe having an outsole with two threaded studs projecting from the heel portion thereof, and a heel piece secured against said heel portion of

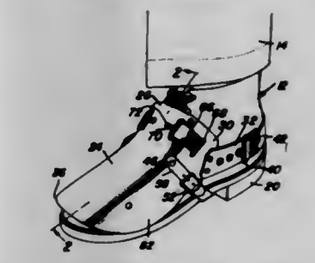
the sole, said heel piece comprising a circular disk of polyurethane having apertures therethrough into which said studs project, a raised circumferential flange on the upper face of said disk bearing against said sole, a circum-

ferential flange extending down from the lower face of said disk, a central boss on the lower face of said disk, and a female screw in threaded engagement with each said stud, each said screw having a head with a knurled shoulder bearing on the under surface of said piece.



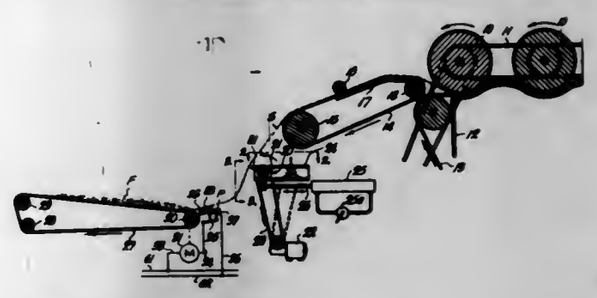
3,271,886
AUXILIARY SHOE SOLE
Glenn R. Hartpence, 8 W. Crest Ave., Winter Garden, Fla.
Filed June 16, 1965, Ser. No. 464,378
4 Claims. (Cl. 36—7.2)

1. An auxiliary shoe sole comprising a bottom member shaped substantially in the shape of a shoe bottom, clamp means slidably mounted within said bottom member, said clamp means provided with adjusting means, releasable securing means operably connected to said adjusting means for releasably securing said adjusting means whereby said clamp means can be adjusted for various size shoe bottoms and fixed when so adjusted, said clamp means comprising a first pair of U-shaped inwardly opening jaws mounted at opposite sides of said bottom member, and a second pair of U-shaped inwardly opening jaws mounted at opposite sides of said bottom member rearwardly of said first pair, said jaws extending upwardly and outwardly from said bottom member, said bottom member including first and second substantially parallel T-shaped slots extending transversely thereof, each of said first pair of U-shaped jaws having an elongate portion slidably mounted in the T-portion of said first slots, each of said second pair of U-shaped jaws having an elongate portion slidably mounted in the T-portion of said second slot, and one of said elongate portions of each pair positioned in overlying relationship with said other elongate portion of said pair, whereby said pairs of jaws are slidably movable in response to sliding of said elongate portions of said slots.



3,271,887
SHOE CONSTRUCTION
David Werman, Merrick, N.Y., assignor to A. Werman & Sons, Inc., New York, N.Y., a corporation of New York
Filed June 8, 1965, Ser. No. 462,180
6 Claims. (Cl. 36—14)

1. A shoe comprising an upper having inwardly directed lasting margins, a one-piece molded midsole including a continuous peripheral portion of substantial thickness having a double-stepped outer margin simulating a storm welt and a surface sloping downwardly at the inside of said storm welt, said lasting margins of the upper being in facially abutting relation, and secured to said slop-



ing surface of the peripheral portion of said midsole, and a molded outer sole secured to the underside of said midsole and constituting the tread surface of the shoe.

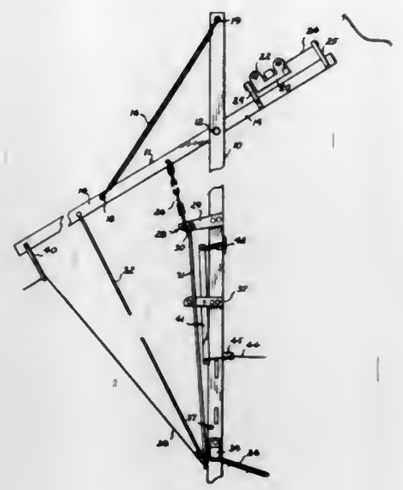
3,271,888
PROTECTIVE ATTACHMENT FOR SHOES
Harold R. Graham and Gerald A. Graham, Tyler, Tex., assignors to James W. Fair, Tyler, Tex.
Filed June 18, 1965, Ser. No. 465,005
3 Claims. (Cl. 36—72)

1. A protective attachment for shoes comprising a generally trough-shaped rigid body having an upturned inner end portion and a generally rounded narrow toe portion and including longitudinally curved lower edges adapted to be spaced laterally outwardly beyond the periphery of the sole of a shoe and normally spaced a predetermined distance above a supporting surface, means connected to said body and extending around portions of a shoe for retaining the body in overlying relation to the shoe, and resilient means extending across the interior of the body in spaced relation to the inner surface thereof and adapted to engage the upper surface of a shoe at longitudinally spaced points for spacing the body above the shoe a distance at least equal to the distance between the lower edges of the toe portion and the supporting surface to enable the body to move downwardly so that the lower edge thereof will transmit forces directly to the supporting surface when an impact is received on said body.

3,271,889
FLATWORK IRONER WITH AUTOMATIC FLATWORK SPREADING MECHANISM
Arch O. Long, Sr., 1311 Tangier Way, Sarasota, Fla.
Continuation of application Ser. No. 145,210, Oct. 16, 1961. This application May 13, 1965, Ser. No. 459,513
5 Claims. (Cl. 38—143)

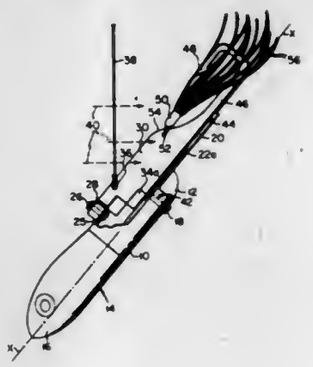
1. The combination of:
a flatwork ironing apparatus having an input end and including gripping means operable to receive and grasp one end of a piece of flatwork fed thereto and

to cause the remainder thereof to be drawn progressively toward and into said input end,
an elongate rotary member disposed near but in advance of said input end and oriented with its long axis transverse to the path of advance of said piece of flatwork so that the said remainder of said flatwork will be trained thereover,
a plurality of radially spaced resilient elements carried by and extending lengthwise of said rotary member and having free edge portions spaced laterally from said rotary member and adapted to engage the underside of said remainder,
ridges located on the free edge portions of said elements, said ridges disposed in oppositely directed echelon patterns proceeding outwardly on the edge from a point intermediate the ends of the element, and
means for rotating said member in a direction whereby said elements, while the ridges are in contact with said remainder of the flatwork, move against the direction of advance of the flatwork.



3,271,890
FISH HOOK BAITING DEVICE
Harold G. Davis, 809 E. Ellsworth, Denver 9, Colo.
Filed June 25, 1962, Ser. No. 204,786
1 Claim. (Cl. 43—4)

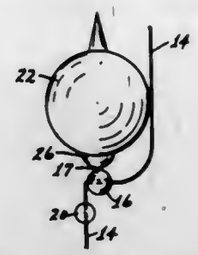
A device for attaching live bait to a fish hook with a rubber band which comprises: a substantially circular heel section having a plurality of fork members integrally attached to one end of said heel section, said fork members having outer cylindrical surfaces, being separated by a U-shaped space, and having outwardly extending shoulders and internal outwardly sloping surfaces at their ends; a stem portion of smaller diameter than said heel section for receiving and storing rubber bands integrally attached to the other end of said heel section; and a reduced diameter section at the other end of said stem section for picking up rubber bands, the diameter of said heel section increasing from its said other end to its said one end to provide for gradually spreading said bands as they are moved from said stem to said forks.



3,271,891
FISHING DEVICE
Henry G. Hancock, 150 Forest Ave., Macon, Ga.
Filed July 21, 1964, Ser. No. 384,162
6 Claims. (Cl. 43—15)

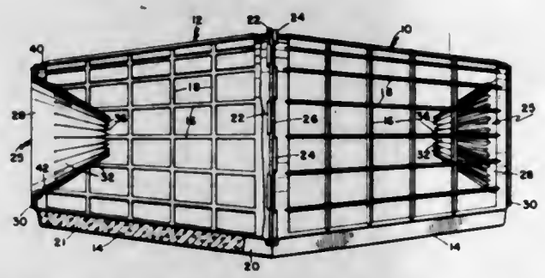
1. An automatic fishing device including stationary support means, means carried by said support means to hold a fishing rod, a cross-arm pivotally carried by said support means, a hook on one end of said cross-arm, spring means to urge said cross-arm to pivot in one direction, said one direction being such as to raise said hook on said one end of said cross-arm, means for preventing rotation of said cross-arm in said one direction, said means including a chain attached to said cross-arm, a ring at one end of said chain, a latch member carried by said support

means to receive said ring, a releasing strap pivotally secured to said latch member in such fashion that when said releasing strap pivots upwardly, said ring will be urged off said latch.



3,271,892
SINKER FOR FISHING LINES
Louis A. Sabrsula, 274 Concord St., San Francisco 12, Calif.
Filed July 13, 1964, Ser. No. 382,249
4 Claims. (Cl. 43—42.03)

1. A sinker arrangement for fishing lines comprising a bar-shaped body of heavy material and having a tapering front end and a rear end, a tail plate rigidly secured to said body at said rear end thereof, a rudder plate disposed at right angles to said tail plate, means for supporting said rudder plate at said rear end for free rotation along a plane parallel and adjacent to said tail plate about an axis extending perpendicular to said tail plate and removed from the center of gravity of said body, and means for attaching a fishing line to said rudder at a point removed from its axis of rotation.

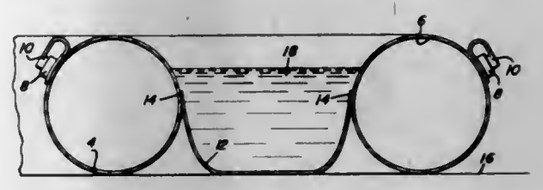


3,271,893
DETACHABLE FISHING FLOAT
Marvin T. Bowers, 3707 North Drive, Greenville, Ohio
Filed May 13, 1964, Ser. No. 367,112
3 Claims. (Cl. 43—43.14)

1. In combination with a fishing line, a hollow float, a semi-spherical bulbous-shaped protuberance formed on the hollow float, there being an aperture formed through the semi-spherical bulbous-shaped protuberance, a snap fastener threaded onto the fishing line, a ball formed on the snap fastener with said ball being adapted to

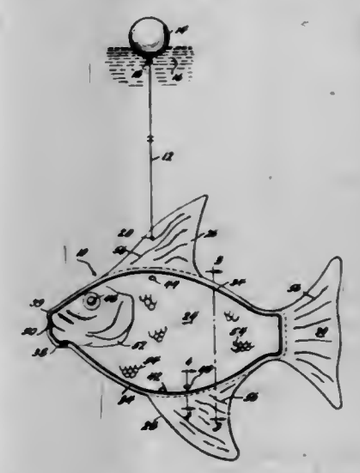
be snapped into the semi-spherical bulbous-shaped protuberance, and with the ball entering the semi-spherical bulbous-shaped protuberance through the aperture formed therethrough.

3,271,894
HEAD FOR SHELLFISH TRAP
Joseph J. Manno, 7450 Girard Ave., San Diego, Calif., and Nils C. Schultz, 5618 Taft Ave., La Jolla, Calif.
Filed Oct. 9, 1964, Ser. No. 402,702
5 Claims. (Cl. 43—65)



1. A head for a shellfish trap comprising:
a frusto-conical body portion having a mounting flange extending radially from the large diameter end thereof; and
a plurality of closely spaced flexible fingers on the smaller diameter end of said body portion and converging inwardly to define a relatively small diameter throat, said fingers having integral bosses providing reinforcement against flexure throughout a portion of their length adjacent the body portion.

3,271,895
CONSTRUCTION TOY COMPRISING PANELS IN PLATE FORM CONNECTABLE BY ELASTIC BANDS
Jens Ole Sørensen, 3 Marediget, Charlottenlund, Denmark
Filed Jan. 3, 1964, Ser. No. 335,549
Claims priority, application Denmark, Jan. 10, 1963, 118; Mar. 27, 1963, 1,389
14 Claims. (Cl. 46—31)



1. In a constructional toy set comprising relatively thin elements having at least two edges, each of said elements being provided with recess means whereby edges of adjacent elements are adapted to be joined by elastic bands passing through said recess means and engaging said elements, the improvement wherein each recess means includes at least two recesses spaced from one another along one of said edges of said element and opening through said one edge, the distance of spacing between said two recesses being the same as the distance between spaced recesses on an edge of every other said element, said recesses being defined by projections extending along said elements, said recess means enabling two of said elements to be joined in edge abutment by placing said two elements edge to edge with said recesses of each element adjacent one another and said recess-defining projections abutting with a said elastic band passing through one pair of adjacent recesses about said abutting projections and along each element and through the other pair of adjacent recesses about said abutting projections, said joining elastic band thereby aligning said two elements in edge abutment and forming a hinge therebetween to allow an arbitrary angle between said two elements.

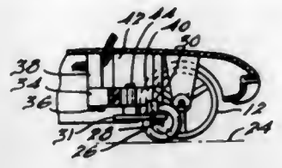
3,271,896
PORTABLE INFLATED WATERWAY FOR TOY BOATS
Kenneth M. Hines, 3420 N. 12th Ave., Evansville, Ind.
Filed Sept. 4, 1964, Ser. No. 394,415
3 Claims. (Cl. 46—87)

2. A portable, collapsible toy waterway for toy boats including a pair of spaced, endless, inflatable and collapsible inner and outer tubes for mounting on a supporting surface, an endless, flexible and collapsible trough means for the reception of water positioned between said tubes, said trough means having the opposed marginal edge portions thereof affixed to the walls of the tubes at points vertically spaced above the supporting surface, said trough means between the opposed walls of the tubes being positioned below the affixed marginal portions thereof so as to rest on the supporting surface and form a pocket for the reception of water.

3,271,897
AQUATIC DISPLAY DEVICE
Ralph J. Gelinas, 5907 Sepulvida Blvd., Van Nuys, Calif.
Filed Jan. 7, 1964, Ser. No. 336,303
3 Claims. (Cl. 46—92)

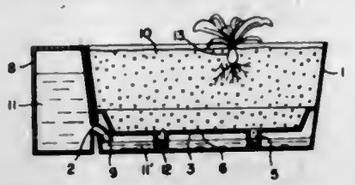
1. An aquatic display device for use in water having currents therein comprising a float, a line and a submerged body secured to said line, said body being formed of at least two sections of pliable plastic material forming

a cavity within said body, at least one fill hole along the bottom of said body and at least one vent hole along the top of said body to provide access to said cavity by said water for display of said device, said body having a plurality of vane elements projecting therefrom, the combined surface area of said vane elements being substantial with respect to the area of said body, said body movable through said water by action of said currents upon said vane elements, the specific gravity of said body being slightly greater than that of water.



3,271,898
SOUND MAKING DEVICE
Marvin I. Glass and Burton C. Meyer, Chicago, and Jerome L. Pinsler, Evanston, Ill., assignors to Marvin Glass & Associates, Chicago, Ill., a partnership
Filed Feb. 1, 1965, Ser. No. 429,340
1 Claim. (Cl. 46—118)

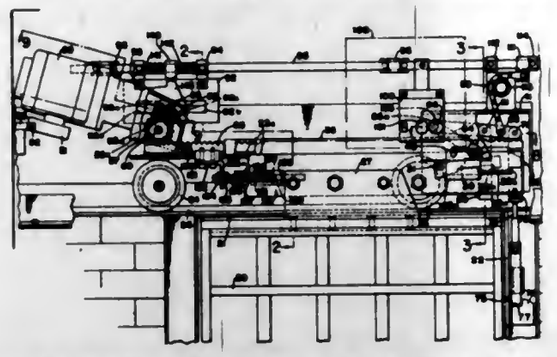
A toy horn comprising an animal figure head defined by an elongated housing having a generally hollow interior, a jaw portion of said head being mounted on the housing for movement relative thereto, sound producing mechanism including a generally frusto-conically shaped diaphragm fixed in transverse relation within said housing rearwardly of said movable jaw portion, said diaphragm having a flat, central section, a striker support means journaled in said housing for rotation relative thereto, a plurality of striker elements carried by said support means in circumferentially spaced relation about the periphery thereof for movement through a path of striking engagement with the flat central section of the diaphragm, each of said striker elements being circular in form and being loosely mounted on the support by means of a pin on the support and an enlarged central opening in the striker, whereby said striker may rotate and also shift radially of said pin, gear drive mechanism in said housing including a main drive gear mounted on a first shaft, a friction drive wheel fixedly mounted on a second shaft, means including an additional gear on said second shaft for placing said drive gear in driving relation with said second shaft and friction drive wheel and also providing for disengaging said main drive gear from said driving relation with said additional gear, means connecting said friction drive wheel with said striker support for effecting rotation of said striker support in response to rotation of said friction wheel, a lever fixed to said main drive gear and projecting from said housing to provide means for manually rotating said main gear, and means connecting said lever with said movable jaw portion to move the latter as said main drive gear is actuated to cause said striker elements to engage said diaphragm.



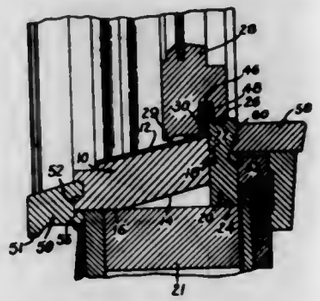
3,271,899
STEERING ARRANGEMENT FOR TOY VEHICLES
Charles H. Vaughan, 2701 Middle Belt, Pontiac, Mich.
Filed June 1, 1964, Ser. No. 371,500
7 Claims. (Cl. 46—210)

1. A toy vehicle having a pair of rear wheels, motor means for driving at least one of said wheels, a ground engaging front steering wheel mounted on said vehicle for limited movement from side to side of the vehicle along an arcuate path the center of curvature of which is vertical and disposed rearwardly of said steering wheel, and a control cord secured to said vehicle independently of said steering wheel by means of which an operator may

exert a laterally directed pull on the vehicle to move the vehicle laterally over said steering wheel to position the latter at the side of the vehicle opposite the side from which the pull on the cord is exerted thereby to effect turning of the vehicle away from the operator.



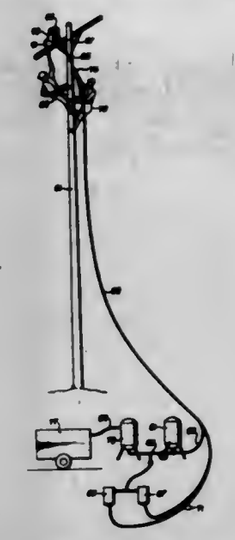
3,271,900
AUTOMATIC PURE CULTIVATOR
Sakae Mori, 604, 5-chome, Setagaya-ku, Tokyo, Japan
Filed Dec. 24, 1963, Ser. No. 333,139
Claims priority, application Japan, Mar. 12, 1963, 38/16,191
1 Claim. (Cl. 47—38.1)



A self-feeding plant holder comprising an open top plant container having a bottom and sides with a side opening, an inner open top box having a bottom with openings, outwardly slanting sides, and hollow legs extending from said box bottom and having side openings, said box being detachably positioned in said container with said legs mounted on said container bottom spacing said box bottom from said container bottom and with said box sides extending to said container sides, a special soil positioned in said box and thereabove in said container towards the open top of said container, a closed solution tank having a laterally extending curved tubular nozzle detachably extending through said container side opening and spaced from said container for allowing air to enter said container beneath said box and said nozzle having an open end positioned on a level beneath said box bottom.

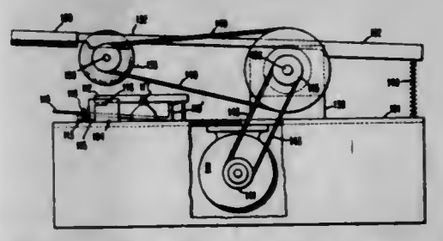
3,271,901
JAIL DOOR OPERATOR
Charles B. Bednar, Cleveland, Ohio, assignor to Van Dorn Company, a corporation of Ohio
Continuation of application Ser. No. 800,277, Mar. 18, 1959. This application Dec. 29, 1965, Ser. No. 518,522
14 Claims. (Cl. 49—17)

1. In combination with a door which is movable between open and closed positions, a doorway frame at which said door is mounted, and a first lock mechanism for locking said door closed, said first lock mechanism including a drop bolt which is movable downward to lock the door closed, a second lock mechanism for locking the door closed which is positioned to be inaccessible from behind said door, common operating means which is actuated when the door is closed to operate both lock mechanisms to lock the door in a closed position, and means coupling said common operating means to said drop bolt for downward movement of said drop bolt when said common operating means is actuated but ineffective to prevent said actuation of said common operating means if said drop bolt is held upwardly out of locking relationship with said door, said coupling means including a link which is movable downwardly in response to actuation of said common operating means, said link having a portion which defines an upwardly facing shoulder and having an opening in said portion, and said drop bolt having means at its upper end which extends slidably up through said opening and which has an enlarged portion resting on the top of said shoulder.



3,271,902
WINDOW SILL AND SASH CONSTRUCTION
Forrest L. Dunsmoor, Oskaloosa, and Herman S. Kuyper, Pella, Iowa, assignors to Roiscreen Company, Pella, Iowa, a corporation of Iowa
Filed Apr. 22, 1964, Ser. No. 361,659
3 Claims. (Cl. 49—483)

1. In a window sill and sash construction, a sloping sill member and a sill support leg along the inside edge thereof, the lower surface of the outside margin of said sill member and the lower edge of said support leg being in the same horizontal plane for direct mounting on the lower member of a window opening, said support leg projecting above the top surface of said sill member, a sash having a rabbeted portion receiving the upper outside corner of the projecting portion of said support leg, a weather stop bar along said projecting portion having an upstanding flange, said sash having a groove receiving said flange, said weather strip bar having an L-shaped portion along the upper outside corner of said projecting portion, the legs of which terminate in flanges directed toward said projecting portion, and said projecting portion having grooves receiving said last flanges.

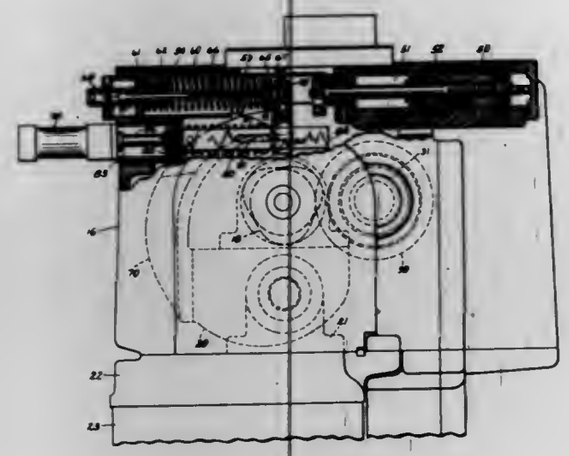


3,271,903
MAINTAINING THE RESISTIVITY OF INSULATING MEMBERS IN ENERGIZED ELECTRIC EQUIPMENT
William C. Gregory, 438 W. Laurel St., Compton, Calif.
Filed Apr. 6, 1965, Ser. No. 446,798
6 Claims. (Cl. 51—8)

1. Apparatus for cleaning and spraying fluids in order to maintain the resistivity of outdoor insulators comprising a source of compressed air, means for removing sufficient water from said compressed air to dehydrate the air so as to make it substantially electrically non-conductive, means for adding metered quantities of powdered abrasive cleaning material to said dehydrated compressed air, means for diverting a portion of said dehydrated compressed air so as to add coating fluid to said mixture of abrasive cleaning material and dehydrated compressed air, means for spraying said mixture of fluid, abrasive

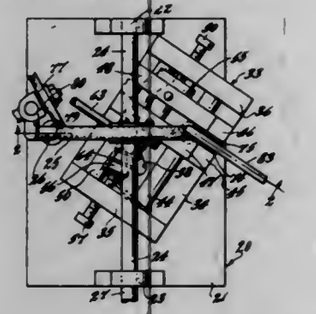
cleaning material and dehydrated compressed air, and spray regulation means separated from the spraying means by electrically non-conductive material, said spray regulation means controlling the amount of mixed fluid, abrasive material and dehydrated compressed air ejected out the spraying means.

3,271,904
PRECISION WIRE SEVERING APPARATUS
Alexander J. Zanni, 19 Bradley St., Binghamton, N.Y.
Filed Feb. 13, 1964, Ser. No. 344,686
6 Claims. (Cl. 51—98)



6. Apparatus for severing thin cylindrical work-pieces into desired lengths, comprising, in combination: a base; a work-piece supporting shelf rigidly attached to said base; means mounted on said base for fixedly supporting a first shaft in a position fixed with respect to said base; an arm mounted on said first shaft for pivotal movement about said first shaft; a spindle carried on said arm; a rotatable cutting tool mounted on said spindle; a motor mounted on said base; first flexible belt drive means connected between said motor and said first shaft; and second flexible belt drive means connected between said first shaft and said spindle.

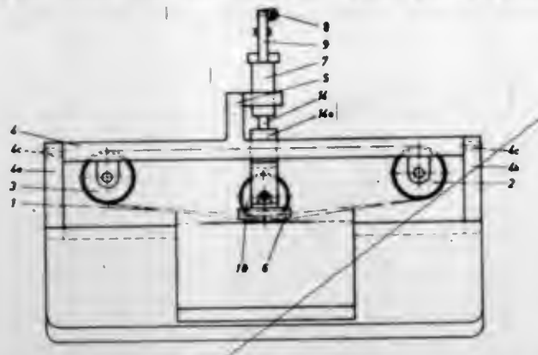
3,271,905
MASTER CAM ACTUATOR
Harold E. Balsiger, Waynesboro, Pa., assignor to Landis Tool Company, Waynesboro, Pa.
Filed Dec. 20, 1963, Ser. No. 332,084
9 Claims. (Cl. 51—101)



1. In a cam grinding machine,
(a) a work carriage,
(b) a cradle pivotally supported on said carriage for rocking movement toward and from a grinding wheel,
(c) a master cam rotatably supported on said cradle,

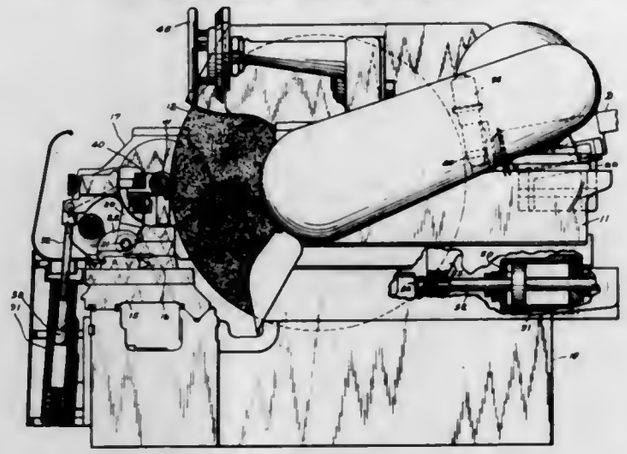
(d) a follower for said master cam,
(e) holding means for applying a predetermined force for holding said follower and said master cam in contact,

(f) and means operable automatically to change the force exerted by said holding means during a grinding operation.



3,271,906
BLADE SHARPENER
Aldo J. Esopi, 604 N. Main St., R.D. 2, Wilkes-Barre, Pa.
Filed Feb. 13, 1964, Ser. No. 344,679
5 Claims. (Cl. 51—102)

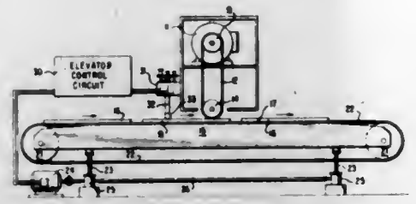
4. A blade sharpener comprising a base, a rotary grinding wheel over said base, a carrier on said base, mounting means mounting said carrier on said base for movement toward and away from said grinding wheel, guide members upstanding from said carrier for movement therewith into and out of operating relationship with said wheel, said guide members being relatively movable toward and away from each other on said carrier for accommodating different-size blades, and operating means operatively connected to said guide members for effecting said relative movement, said operating means comprising constraining means operatively associated with said guide members to effect equal and opposite relative movement thereof.



3,271,907
GRINDING MACHINE
Karl Heesemann, 54 Friedenstrasse, Rehme, via Bad Oeynhausen, Germany
Filed Jnne 26, 1964, Ser. No. 378,277
16 Claims. (Cl. 51—141)

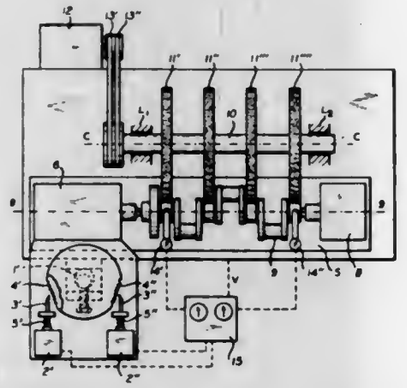
1. In a grinding machine for grinding rabbets and other profiles, of the type including a circulating endless abrasive band having an upper and a lower reach, said abrasive band being guided over pulleys one of which is a driving pulley, the combination of a supporting beam having a presser shoe mounted thereon so as to be movable transversely of the direction of movement of said abrasive band and in a direction parallel to the plane of the upper reach of said abrasive band, and a profiled

presser member rotatably mounted in a recess in said presser shoe, said presser shoe engaging under pressure said abrasive band on the side remote from a workpiece thereby to bring said abrasive band into biased contact with a profile to be ground of said workpiece.



3,271,908
DRESSER CONTROL FOR ABRASIVE WHEELS
Hugh N. Rocks, Waynesboro, Pa., assignor to Landis Tool Company, Waynesboro, Pa.
Continuation of application Ser. No. 839,392, Sept. 11, 1959. This application Nov. 15, 1963, Ser. No. 324,609
10 Claims. (Cl. 51—165)

2. In a grinding machine for grinding cylindrical workpieces, a bed, a grinding wheel support slidably mounted on said bed for movement transversely toward and from a workpiece, a grinding wheel rotatably mounted on said grinding wheel support, feeding means for effecting said transverse movement of said grinding wheel support to perform a grinding operation, a dressing tool, means for traversing said dressing tool across the grinding wheel, a plurality of control means actuated by said feeding means at different points in the transverse movement of said wheel support for actuating said dresser traversing means, and selector means operable in advance for connecting one of said control means with said dresser traversing means.



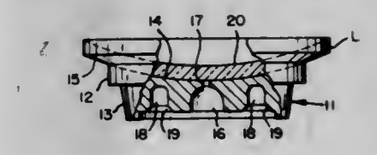
3,271,909
GRINDING APPARATUS
Richard D. Rutt, Wilson, and Adolph C. Carlson, Grand Island, N.Y., assignors to The Carborundum Company, Niagara Falls, N.Y., a corporation of Delaware
Filed Mar. 13, 1964, Ser. No. 351,692
11 Claims. (Cl. 51—165)

1. A grinding apparatus comprising:
a grinding head having a driven abrasive surface;
a worktable spaced beneath said grinding head to support workpieces for treatment by said abrasive surface;
an elevator mechanism for adjusting the relative vertical positions between the worktable and said abrasive surface;
means for sensing the vertical position of the upper surface of a workpiece placed on said worktable; and

control means operatively connected to said elevator mechanism and responsive to said sensing means for adjusting the relative vertical distance between said worktable and said abrasive surface to effect removal of material by said abrasive surface from the upper surface of the workpiece down to a fixed level below the upper surface thereof.

3,271,910
METHOD OF AND APPARATUS FOR CORRECTING THE SIZE AND ANGULAR RELATION BETWEEN A WORKPIECE TO BE GROUND AND A TOOL
Rudolf Haisch, Dahlienweg 19, Ruit, Kreis, Esslingen (Neckar), Germany
Filed June 10, 1964, Ser. No. 374,126
Claims priority, application Germany, Apr. 12, 1961, H 42,273
7 Claims. (Cl. 51—165)

1. In a machine for grinding a work piece,
means for rotatably supporting a work piece comprising
a base,
a head stock and a foot stock operatively mounted on said base,
means for maintaining final size of all portions of said work piece within close predetermined limits comprising
gages disposed at at least two points axially spaced apart from each other on said work piece,
means for deforming at least one of said means rotatably supporting said work piece, comprising
a reversible adjusting mechanism,
gage actuated control means for actuating said adjusting mechanism during the grinding operation,
said gages being operatively connected to and controlling said gage actuated control means,



said gage actuated control means being responsive to variations in size of said work piece and to the angular relation between the grinding wheel axis and the work piece axis between said engaging points of said gages on said work piece, respectively, during the grinding operation to actuate said adjusting means in order to correct said size variations to a predetermined size,
whereby any change in the predetermined angular relation between the grinding wheel axis and the work piece axis is corrected during the grinding operation.

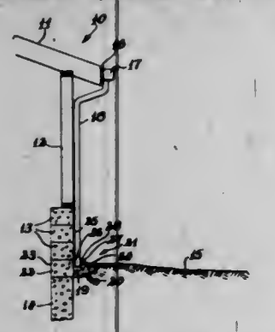
3,271,911
ABRASIVE WHEEL
Philip M. McKenna, Greensburg, Pa., assignor to Kennametal Inc., Latrobe, Pa., a corporation of Pennsylvania
Filed Apr. 20, 1964, Ser. No. 361,066
18 Claims. (Cl. 51—206)

1. A grinding wheel comprising; a metal body having an axis of rotation and a surface on the body concentric with said axis, abrasive means secured to said surface, said body consisting of single integral mass of metal having a Young's modulus of elasticity on the order of at least 40 million pounds per square inch, and said abrasive means secured to said surface comprising abrasive particles in a bonding matrix.

3,271,912
LENS BLOCKS
Lloyd A. Buckminster, Geneva, N.Y., assignor, by direct and mesne assignments, of one-half to Textron, Inc., Providence, R.I., a corporation of Rhode Island, and one-half to American Optical Company, Southbridge, Mass., a voluntary association of Massachusetts
Application Aug. 2, 1962, Ser. No. 214,261, which is a division of application Ser. No. 4,950, Jan. 27, 1960, now Patent No. 3,192,676, dated July 6, 1965. Divided and this application Mar. 1, 1965, Ser. No. 435,801
2 Claims. (Cl. 51—216)

1. The combination with a lens blank, of a lens block for holding the blank in a machine during processing of the blank,
(a) said block being a metallic alloy having a lower melting point than said lens blank and having one end face molded on said blank to conform in shape to and directly adhered to one face of said blank,
(b) said block having an integral relatively short shank, the maximum overall axial extent of the block being approximately equal to the maximum overall axial extent of the blank,

(c) said shank having two recesses, which extend partway only into said shank for receiving driving pins of the machine, said recesses extending toward said one end face from the end of said shank opposite to said one end face, and



(d) said shank having therethrough a separate hole which extends from said opposite end of said shank centrally of said shank through to said one end face, thereby permitting gauging of the thickness of the lens blank which is held by said block.

3,271,913

MEANS FOR DISPERSING WATER FROM A ROOF OVER ADJACENT LAND SURFACE

William F. Fields, 418 S. Monroe St., Lincoln, Ill.

Filed Jan. 15, 1964, Ser. No. 337,816
3 Claims. (Cl. 52—16)

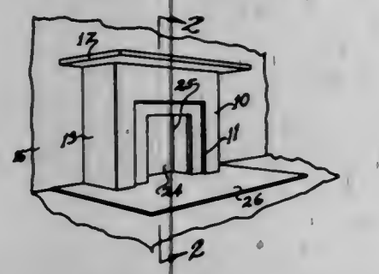
1. Means for collecting from a roof water due to rain and melting snow and ice comprising:

(a) an eaves gutter underlying a lower edge of the roof,

(b) a foundation gutter extending at ground level underneath the building wall carrying said roof edge,

(c) said foundation gutter having a trough extending along the outer side of said building wall with the bottom of said trough below the land surface,

(d) the upper surface of said foundation gutter along the side of said trough away from said wall being located along the adjacent land surface, and



(e) a downspout extending from said eaves gutter along the outer side of said building wall with its lower end constructed and arranged to discharge water into said trough to flow over said upper surface of said foundation gutter onto the adjacent land surface.

3,271,914

COLLAPSIBLE MANTEL

Maxie F. Boyett, 412 Tuscaloosa Ave., Birmingham, Ala.

Filed Jan. 20, 1964, Ser. No. 338,902
1 Claim. (Cl. 52—36)

A collapsible mantel comprising:

(a) a front panel having a fireplace opening therein,

(b) side panels at opposite sides of said front panel,

(c) means hingedly connecting each of said side panels along one edge thereof to an adjacent side edge of said front panel in position for each side panel to move from a collapsed position alongside and inwardly of said front panel to an extended position generally perpendicular to said front panel,

(d) a top panel,

(e) hinge means connecting the inner surface of said top panel to the inner surface of said front panel above said fireplace opening in position for said top panel to extend in a generally horizontal position perpendicular to said front panel and be supported by said side panels while said side panels are in said extended position and upon movement of said side panels to collapsed position said top panel is disposed to move inwardly and downwardly alongside the collapsed side panels,

(f) means limiting forward movement of said top panel relative to said front panel while said top panel is held in a generally horizontal position by said side panels,

(g) there being vertically extending under-cut grooves along the inner sides of the fireplace opening, and

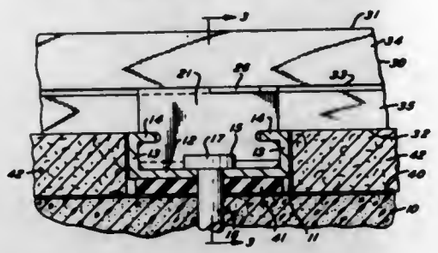
(h) a flexible sheet-like fireplace backing member adapted to fit within said fireplace opening with the edges of said sheet-like backing member engaging said under-cut grooves, whereby said backing member is held in place.

3,271,915

OIL WELL DRILLING APPARATUS WITH SELF-RAISING DRAWWORKS SUPPORT

Homer J. Woolslayer, Cecil Jenkins, and Joseph R. Woolslayer, Tulsa, Okla., assignors to Lee C. Moore Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

Filed Jan. 2, 1964, Ser. No. 335,039
9 Claims. (Cl. 52—122)



6. In oil well drilling apparatus, a gin pole provided with forwardly and upwardly inclined rear legs forming a track, an upright mast disposed against the front of the gin pole, a crown block supported by the mast, a traveling block in the mast, a line suspending the traveling block from the crown block and also extending down the back of the mast, a support extending rearwardly from the bottom of the gin pole, drawworks rigidly mounted on said support and operatively connected to the lower end of said line, wheels mounted on said support and engaging said legs for rolling up and down them, sheave means supported by the mast above the gin pole, a sling extending around said sheave means and connected to the traveling block and drawworks support for moving the support up said legs when the drawworks is operated to raise the traveling block in the mast, and means for detachably securing the raised support to the upper part of the gin pole with the major portion of the support overhanging the back of the gin pole.

3,271,916

UNIFORMLY RESILIENT FLOORING SYSTEMS

Ray E. Omholt, Berwyn, Pa., assignor to Powerlock Floors, Inc., Philadelphia, Pa., a corporation of Pennsylvania

Filed Jan. 27, 1965, Ser. No. 428,471
5 Claims. (Cl. 52—393)

1. In a flooring system having

a plurality of floor boards superposed on and transversely spanning a plurality of spaced parallel supporting members on a foundation,

said floor boards having upper and lower faces, and

fastening members holding said floor boards to said parallel supporting members, and

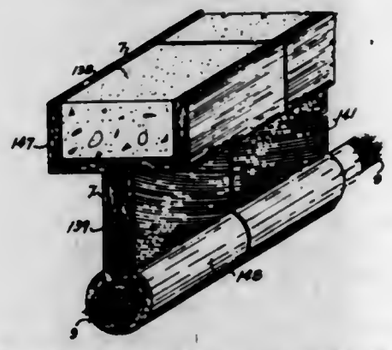
members for attaching said supporting members to the foundation,

the improvement which comprises, for imparting substantially uniform load bearing and impact response characteristics to the upper faces of the boards,

resilient supporting inserts in and substantially longitudinally filling the spaces between said supporting members and enhancing the span response of said floor boards to load and impact,

said resilient supporting inserts having their upper margins in engagement with the lower faces of said floor boards and their lower margins in engagement with said foundation and thereby directly imparting their load bearing and impact response characteristics substantially uniformly to the floor boards,

said parallel supporting members having resilient supports interposed between said supporting members and said foundation,



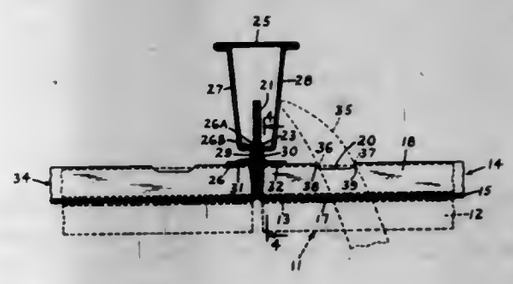
said resilient supports and said resilient supporting inserts having different predetermined resiliency and load bearing characteristics for substantially balancing the load bearing and resilient impact response characteristics of said floor boards in span and over said supporting members.

3,271,917

REINFORCED PLASTIC CONSTRUCTIONS

David Rubenstein, 2750 2nd Ave., San Diego, Calif.

Original application June 12, 1959, Ser. No. 820,067. Divided and this application May 4, 1965, Ser. No. 453,127
14 Claims. (Cl. 52—309)



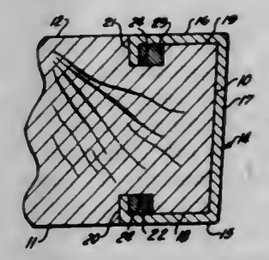
1. An article of manufacture comprising a preformed plastic element having two spaced apart vertical webs and a horizontal bottom web interconnecing the said two vertical webs, said element also having a horizontal upper web spaced vertically from said bottom web, a compression resistant material disposed between the upper portions of said vertical webs and resting on said horizontal upper web, said vertical and horizontal webs comprising a resinous composition covering with a fibrous-metal reinforcement disposed in said vertical and horizontal bottom webs, said bottom and upper horizontal webs and portions of said vertical webs defining an enclosed space and tensile load resisting member disposed in said space.

3,271,918

HANGER ASSEMBLY

George T. Phillips, Bedford Village, N.Y., assignor to James A. Phillips Inc., New York, N.Y., a corporation of New York

Filed June 16, 1964, Ser. No. 375,473
5 Claims. (Cl. 52—493)



1. Tile support apparatus for a panel of tiles comprising, a channel member having formed therein a lengthwise slit with resiliently separable sides, a tile-support bracket disposed outwards of said slit in transverse relation to the center plane thereof, said bracket having a web towards said slit, flange means extending from said bracket into said slit and releasably grasped within said slit by the resilient sides thereof, and fulcrum means provided by said web for a tool adapted by engagement with said fulcrum means to exert on said bracket a pulling force by which said flange means is removable from said slit.

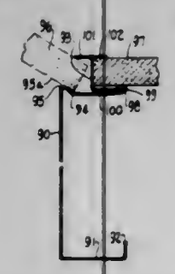
3,271,919

DOOR EDGE PROTECTOR

Robert N. Olton, 2943 E. Overlook Road, Cleveland, Ohio

Filed Aug. 5, 1964, Ser. No. 387,629
9 Claims. (Cl. 52—624)

1. The combination of a door and door edge protector including means for fitting and fastening said protector on and to an edge of said door,



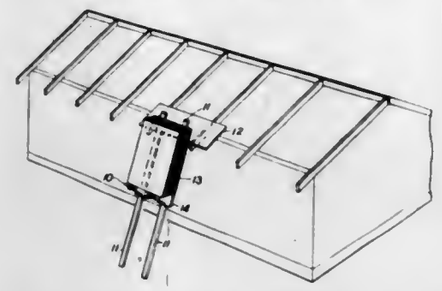
said door comprising front and rear sides and an edge bounding said sides and extending between the marginal portions thereof, said front and rear sides having grooves therein extending longitudinally along said marginal portions associated with said edge to be protected and spaced laterally from said associated edge, said grooves each having laterally spaced apart, longitudinally extending side walls farther from and nearer to said associated edge, and an open side facing outwardly of a side of said door, and

said door edge protector comprising a longitudinally extending channel-shaped strip of durable material having laterally spaced apart legs joined together along their laterally opposite edges by a longitudinally extending web, said legs lying against and engaging said associated marginal portions and substantially covering said open sides of said grooves therein, and said web lying against and engaging said associated edge, flanges on said legs extending into said grooves along and adjacent said groove side walls farther from said associated edge, means for fitting and fastening said channel-shaped strip on said door edge comprising longitudinally extending fitting and fastening strips lying in said grooves inside of and hidden by said legs of said channel-shaped strip substantially covering said grooves, said fitting and fastening strips engaging and acting between said groove side walls nearer to said associated edge and said flanges and urging said flanges toward said groove side walls farther from said associated edge and tending to retain said flanges between and in engagement with said locking strips and said groove side walls farther from said associated edge.

3,271,920
WALL SUPPORTING STRUCTURAL BEAM

Lucien R. Downing, Jr., Avon Lake, Ohio, assignor to Donn Products, Inc., Westlake, Ohio, a corporation of Ohio

Original application Sept. 7, 1962, Ser. No. 221,988, now Patent No. 3,217,460, dated Nov. 16, 1965. Divided and this application Apr. 21, 1965, Ser. No. 458,506
4 Claims. (Cl. 52—735)



1. A beam for structurally supporting a pair of panel members of disparate thickness in a common plane in edge-to-edge relation to each other and in fixed spaced parallel relation to an opposite panel member to form a double-wall structure, comprising a main web portion disposed in a plane normal to the panel surfaces, laterally extending flange means along one marginal edge of said web portion disposed in parallel continuous relation with a surface of said opposite panel member for receiving a panel-fastening member in interlocking relation therethrough, the other marginal edge of said main web being displaced laterally to form an auxiliary web integrally interconnected with the main web by a transverse portion, said transverse portion comprising a first part extending away from said main web and a second part rebent above said first part toward said main web, said auxiliary web extending parallel to said main web substantially intermediate said first part from the marginal edge of said second part, said first part forming a lateral abutment surface for the marginal surface of one of said pair of panel members, said second rebent part forming an opposing lateral abutment surface for the marginal surface of the other of said pair of panel members, said auxiliary web being disposed between the mating edges of said pair of panel members, and means coacting with said auxiliary web in spaced relation from said lateral abutment surfaces for engaging and retaining said pair of panel members in fixed abutting relation thereagainst.

3,271,921
MATERIAL HOLDING BRACKET PLATFORM AND METHOD FOR UTILIZING THE SAME IN ROOFING CONSTRUCTIONS

Alvin L. Divoky, 1207 Childs Road, Omaha, Nebr.

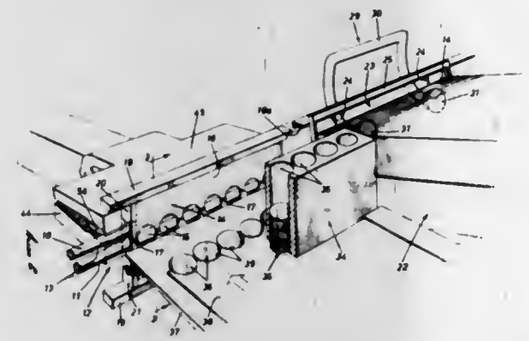
Filed Apr. 6, 1964, Ser. No. 357,501
4 Claims. (Cl. 52—747)

4. The method of providing a skeletal roof with a skin of rigid sheet material, said method comprising:
(A) Nailing down onto the rafters of a skeletal roof, a horizontal eave less than fourteen feet above the ground, a first sheet of rigid sheet material, said so nailed sheet material being located along and substantially conterminous with said horizontal eave,
(B) Attaching a platform member to an elongate post member, said platform member projecting outwardly from and being substantially perpendicular to said elongate post member at a position at least three feet from an end thereof,
(C) Positioning at least two of said so platformed post members parallel to one another and obliquely against the said first nailed sheet of rigid sheet material,
(D) Manually elevating rigid sheet material onto the upper surface of said platform member and standing said sheet material upon a lower first end thereof whereby the upper end of said standing sheet material extends above said first nailed sheet,
(E) Manually removing said standing sheets one at a time by grasping the upper end thereof, and
(F) Nailing down said manually removed sheets onto the rafters of the skeletal roof.

3,271,922
ARRANGEMENT FOR PROTECTING FLOWERS AND WRAPPING THE SAME

Lawrence B. Wallerstein and William Bachman, both of 87 Daisy Farms Road, New Rochelle, N.Y.

Filed Apr. 24, 1962, Ser. No. 189,888
2 Claims. (Cl. 53—3)

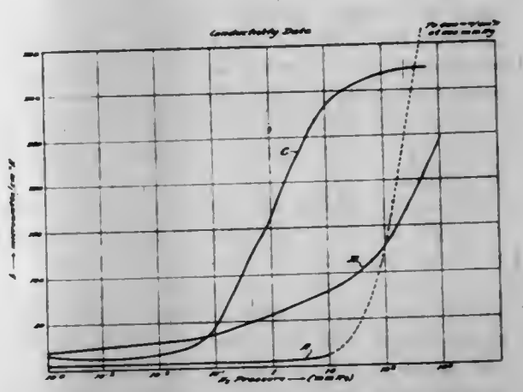


1. A method for protecting and packaging delicate leaved and petaled flowers, said packaging being limited to the height of the petals and extending upwardly only over the height of the petals from where the petals form the stem to the upper ends of the petals without compressing the petals but with the petals being in close immobilizing contact, comprising gathering together the petals upwardly together and inwardly toward the stem from below, providing a light thin flexible paper rectangle having the height only of the petals and formed into a conical sleeve around the stem below the leaves and petals to be protected, said paper rectangle having oppositely facing end coatings of a cohesive material extending the height of the edges thereof which will adhere to itself and not to the flowers, overlapping the end edges of the sleeve with the overlap carrying the light cohesive coatings and permitting adjustment to lightly frictionally encircle the flower petals, and then enclosing the gathered petals by closing the sleeve around the same, said sleeve being held in position by the frictional expansion tendency of the gathered leaves and petals, and said sleeve having conical shape with narrowing diameter downwardly toward the stem.

3,271,923
METHOD AND APPARATUS FOR FILLING AND SEALING HOLDERS FOR TOKENS, COINS OR THE LIKE

Allan G. Fullbrook, Rexdale, Ontario, Canada, assignor to Dominion Paper Box Company Limited, Toronto, Ontario, Canada

Filed Sept. 16, 1963, Ser. No. 309,088
7 Claims. (Cl. 53—33)



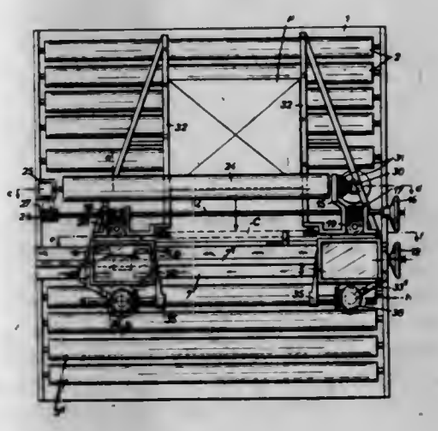
7. A method for filling and sealing holders for tokens, coins or the like which comprises supporting a token holder having a plurality of aligned apertures therein in front of two spaced-apart members having an opening therebetween with the apertures in said token holder positioned opposite to the opening between said members, advancing a plurality of tokens of larger size than the apertures in said token holder into and part way through the apertures in said token holder and from the side of said token holder remote from said members, advancing both said token holder and said tokens through the opening between said members, thereby folding said token holder between said members, and subsequently securing together the folded sides of said token holder.

3,271,924
METHOD OF INSULATING CRYOGENIC SUBSTANCES

Walter Patrick Gramm, Wilmette, and William R. Howell, McHenry, Ill., assignors to Great Lakes Carbon Corporation, New York, N.Y., a corporation of Delaware

Filed Sept. 3, 1963, Ser. No. 305,981
6 Claims. (Cl. 53—29)

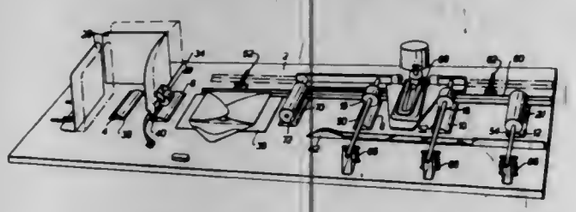
3. A method for storing low boiling liquids and retarding their evaporation for sustained periods comprising:
providing a confined inner storage space for the liquid and a confined annular space surrounding said storage space;
filling this annular space with a material comprising an essentially non-activated expanded carbonaceous material having a loose bulk density of between about 10 and about 13 lbs. per foot^3, a volatile content of between about 10 and about 13% and a particle size such that less than about 40% is +150 mesh, about 40 to about 50% is —200 mesh, and about 10 to about 25% is —325 mesh produced from finely divided bituminous coal having a volatile content of between about 15% and about 23% and a particle size such that at least about 95% is —100 mesh and at least about 50% is —325 mesh by
flash calcining the coal at a temperature of between about 700° C. and about 900° C. while entrained in a gaseous atmosphere containing between about 2.0 and about 4.0 standard cubic feet of oxygen per pound of feed,



separating the solid partially calcined particles from the gaseous and vaporous products at a temperature at which substantially all of these vaporous products remain in the vaporous state, and
collecting the particles;
removing substantially all of the gas from the annular space; and introducing the low boiling liquid into the inner storage space.

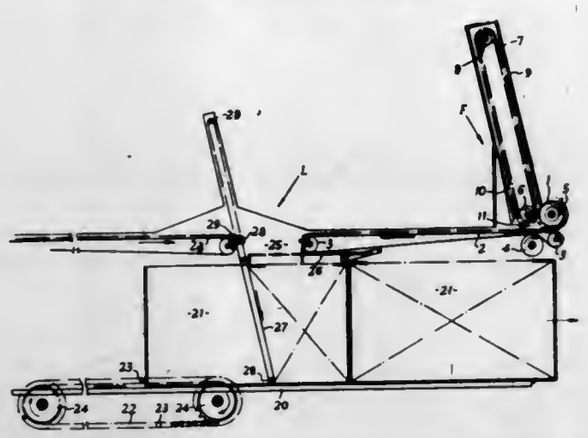
3,271,925
PACKING MACHINES

Francois Aubery, 18 Rue Colbert, Valence, Drome, France



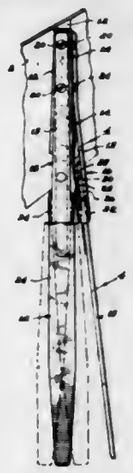
Filed Mar. 12, 1964, Ser. No. 351,453
Claims priority, application France, Mar. 20, 1963, 8,647, Patent 1,351,883; June 26, 1963, 8,720; July 10, 1963, 8,733; Dec. 12, 1963, 8,822
16 Claims. (Cl. 53—128)

1. A packing machine comprising:
(a) a frame,
(b) a first lower casing fixed to said frame and adapted for containing reinforcing elements,
(c) a second lower casing adapted for containing reinforcing elements,
(d) first and second upper casings adapted for containing reinforcing elements, the first and second upper casings being above the first and second lower casings respectively,



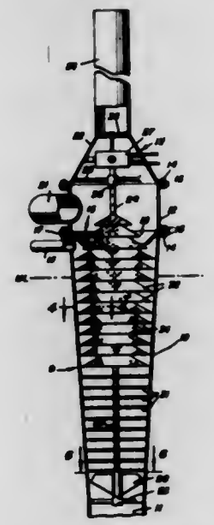
(e) screw means for displacing the second lower casing together with the second upper casing towards and away from the first upper and lower casings,
(f) means for synchronously displacing the upper casings vertically towards and away from the lower casings,
(g) horizontal rollers for supporting a pack of material, the rollers being rotatably mounted on said frame,
(h) a drive roller for contacting and displacing a pack of material across said horizontal rollers and between the first and second casings, the drive roller being rotatably carried by said upper casings and being vertically displaceable therewith,
(i) means for ejecting reinforcing elements from the upper and lower casings towards a pack between the casings,
(j) means for folding each ejected reinforcing element to a right angled form about an edge of the pack,
(k) guide wheels carried by said casings,
(l) an endless chain entrained around said guide wheels and having runs defining a loop the size of which varies with the relative positions of the casings and through which loop a succession of packs are propelled by said drive roller, the chain having runs in addition to the runs defining the loop, said chain being payed out from and taken up by the additional runs to compensate for variations in the length of the perimeter of the loop as a consequence of variations in the size of the loop,
(m) means for driving said chain, and
(n) means carried by the chain for engaging an elongated strapping element and for drawing the strapping element around said pack to form a tie around the pack with said reinforcing elements between the strapping element and the pack.

3,271,926
OFFICE MAILING MACHINES
Hilda May England, 25 Lovers Walk, Dunstable, England
Filed Nov. 27, 1963, Ser. No. 326,540
5 Claims. (Cl. 53—188)



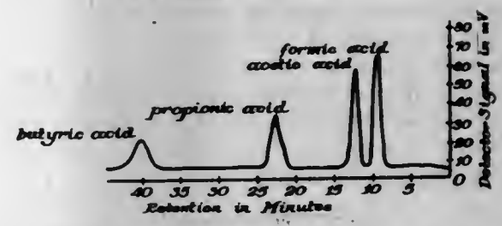
1. An office mailing machine comprising an adjustable hopper adapted to receive a stack of envelopes, a power driven roller, a feed bar for raising the roller into momentary contact with the lowermost envelope of the stack to feed the envelopes one by one from the hopper, a working table, pairs of vertically aligned co-acting feed rollers spaced along the table for moving each envelope as it issues from the hopper, power means for collectively driving the lower rollers of the pairs of rollers, opening in the table through which openings the said lower rollers project, a pad of resilient material at a first operative position on the table for facilitating the manual opening of each envelope for the insertion of enclosures therein, a curved guide at a second operative position on the table for engagement by the flap of each envelope whereby the flap is turned up and then over each envelope, a moistening device at a third operative position on the table for applying moisture to the sealing margins of the flap, and a pair of co-acting, vertically aligned rollers for applying pressure to the flap to effect the sealing of the envelope.

3,271,927
APPARATUS FOR FILLING BOXES, TRAYS OR THE LIKE
Desmond Walter Molins, London, England, assignor to The Molins Organisation, Limited, a British company
Filed Dec. 26, 1963, Ser. No. 333,330
Claims priority, application Great Britain, Jan. 2, 1963, 228/63
6 Claims. (Cl. 53—236)



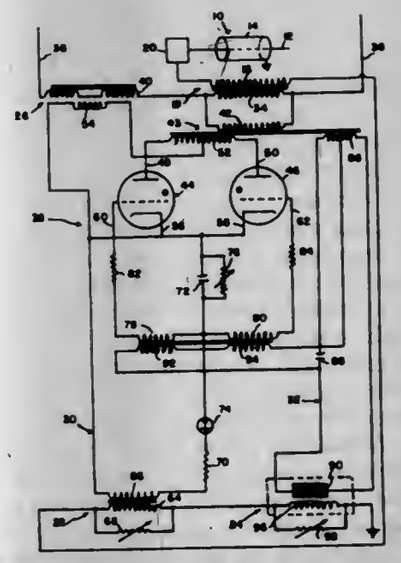
1. Apparatus for filling open-topped containers such as trays with relatively small articles, comprising article feeding means for feeding articles to a position over a container to be filled and permitting said articles to fall therein, a guide member arranged in operation to extend into said container substantially the whole depth thereof, an endless flexible band forming part of said guide, means for producing relative motion between said container and said guide, an article-engaging face of said guide being provided by said band and cooperating with an end wall of said container to provide an article-receiving space whose length increases from a minimum to a maximum during the filling operation by virtue of said relative motion, and means to drive said band during the filling operation.

3,271,928
PACKER GRID
Anton J. Wild, 968 Bonnell Court, Union, N.J.
Filed July 24, 1963, Ser. No. 297,248
8 Claims. (Cl. 53—248)



1. A packer grid for guiding articles from an assembly device to a container in a packaging machine, said packer grid comprising a generally rectangular frame, strips of material extending in equally spaced relation parallel to and between opposite sides of said frame, a plurality of elongated finger members formed of resilient material and arranged in positions wherein the inwardly facing surfaces thereof cooperate to define passages for guiding articles moving through the packer grid, supporting blocks secured to said frame and strips and presenting inwardly facing surfaces inclined upwardly and outwardly with respect to said passages, means engaging the upwardly and outwardly inclined surfaces of said supporting blocks and the upper portions of said finger members to hold said finger members in said cooperative positions, said finger members having lower portions thereof extending downwardly and inwardly below said supporting blocks, and resilient means secured to said supporting blocks and bearing against outwardly facing surfaces of the finger members for yieldably urging the lower portions of the finger members inwardly toward said passages.

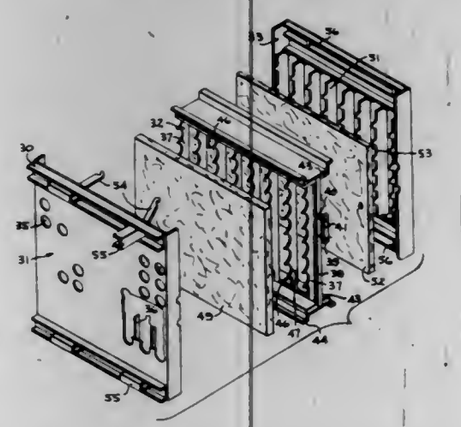
3,271,929
VORTEX TYPE RECONDITIONER AND RECONDITIONING METHOD FOR USED DRILLING MUD
J. E. Bowden and Cornelius G. Lynch, Hobbs, N. Mex., assignors to Vortex Tool & Manufacturing Co., Odessa, Tex., a corporation of Texas
Filed May 7, 1963, Ser. No. 278,687
9 Claims. (Cl. 55—52)



1. The method of reconditioning used drilling mud in a conical shaped vessel in atmospheric communication adjacent its top comprising the steps of introducing the mud in fluid state into said conical shaped vessel through the smaller bottom end thereof while the vessel has at least half of its vertical height immersed in a tank of the used drilling mud and pumping the used fluid drilling mud in said vessel with a rotating, swirling and upward motion, accelerating the rotating swirling motion of the fluid mud by rapidly rotating perforated conical discs positioned with their concave sides facing downwardly to subject the mud to centrifugal action so that the heavier particles are flattened against the outwardly tapered wall of the conical vessel and separated from the mud, said heavier particles moving outwardly and upwardly while held against the conical wall of the vessel by centrifugal force, directing the separated heavier particles against a catch ring projecting across the path of the ascending particles adjacent the upper end of the conical vessel to arrest the upward movement of said particles, expelling these arrested particles from the vessel through outlet means positioned adjacent to and below said catch ring, said rapidly rotating discs creating a vortex with a void at substantially the transverse center of the vessel and causing the liberation of the gas from the mud so that the liberated gas moves into the void and upwardly through the perforations in the discs, discharging the liberated gas from the vessel into the atmosphere adjacent the top of the vessel, and recovering the reconditioned mud for reuse.

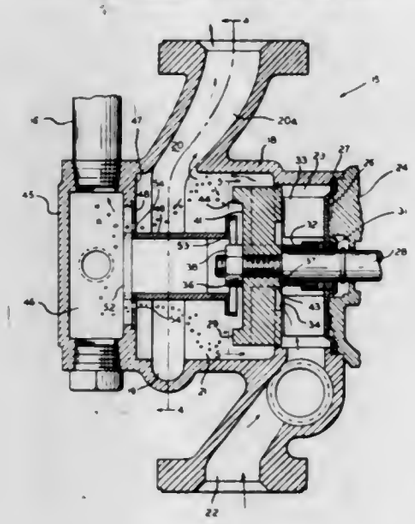
3,271,930
PRE-TREATMENT OF CARRIERS FOR USE IN GAS/LIQUID DISTRIBUTING CHROMATOGRAPHY
Gert Ewald, Hermulheim, near Cologne, Horst Zech, Bruhl, near Cologne, and Hermann Esser, Glesel, near Cologne, Germany, assignors to Knapsack-Griesheim Aktiengesellschaft, Knapsack, near Cologne Germany, a corporation of Germany
Filed Oct. 14, 1964, Ser. No. 403,739
Claims priority, application Germany, Oct. 23, 1963, K 51,156
6 Claims. (Cl. 55—67)

1. A gas chromatographical process for analyzing gaseous mixtures comprising the steps of intimately mixing a chromatographic carrier substance selected from the group consisting of kieselguhr, aluminum oxide, silicates and special preparations thereof with about 1–20% by weight of said carrier substance of orthophosphoric acid, heating the resulting mixture for a period of about 0.5 to about 10 days at a temperature of about 100–300° C., contacting said acid treated carrier substance with a separating liquid, and passing over said carrier substance contacted with said separating liquid said gaseous mixtures to be analyzed.



3,271,931
AUTOMATIC CONTROL FOR FLY ASH PRECIPITATORS
Frank L. Taylor, Franklin, Mich., assignor to The Detroit Edison Company, Detroit, Mich., a corporation of New York
Filed Jan. 29, 1965, Ser. No. 438,144
5 Claims. (Cl. 55—105)

1. An automatic control for an electrical precipitator comprising first means operatively associated with said precipitator responsive to power arcs in said precipitator for automatically decreasing the voltage applied thereto to shorten the arc time of each individually occurring power arc, including a precipitator high voltage transformer having a primary and a secondary winding for supplying voltages to said precipitator, a saturable reactor having a field winding connected in series with the primary winding of said transformer, a thyratron rectifier

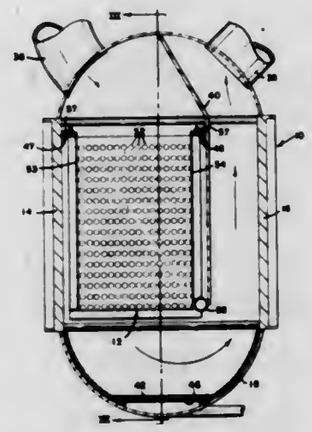


including plate and output circuits, a thyratron plate voltage transformer having a secondary winding in the plate circuit of the thyratron rectifier and a primary winding in parallel with the primary winding of the precipitator high voltage transformer and a control winding for said saturable reactor connected in the output circuit of the thyratron rectifier, second means separate from said first means connected in the precipitator circuit in combination with said first means responsive to the rate of sparking of said precipitator for automatically varying the voltage applied to the precipitator conjointly with said first means in a direction to maintain an optimum precipitator sparking rate, and third means separate from said first and second means also connected in the precipitator circuit in combination with said first and second means responsive to precipitator current for automatically varying the voltage applied to the precipitator conjointly with said first and second means in a direction to maintain a maximum current in the precipitator circuit.

3,271,932
ELECTROSTATIC PRECIPITATOR
Robert W. Newell, Yardley, Pa., assignor to General Electric Company, a corporation of New York
Filed July 21, 1965, Ser. No. 473,632
8 Claims. (Cl. 55—132)

1. An electrostatic precipitator comprising a casing having a gas inlet and outlet, a removable filter unit within the casing comprising an apertured plate at ground potential positioned adjacent the gas inlet, a high voltage charging grid member supported in the casing adjacent the apertured plate and insulated from the other members, and a downstream grid at ground potential arranged between the high voltage charging grid member and the gas outlet, and fastening means for holding the apertured plate, the high voltage charging grid member and the downstream grid together, the innermost surface of the apertured plate including a plurality of parallel vanes spaced between the apertures, the high voltage charging grid member formed by a plurality of parallel electrodes arranged generally in parallel with the vanes of the apertured plate but intermediate thereof, said electrodes having a leading edge with a plurality of spikes having tips that are adapted to be centered within the apertures of the said plate, the downstream grid being formed with a plurality of parallel vanes generally in line with the vanes of the apertured plate, one sheet of porous dielectric filtering media sandwiched between the vanes of the apertured plate and the electrodes of the high voltage charging grid member, and a second sheet of similar filtering media sandwiched between the electrodes of the high voltage charging grid member and the downstream grid, whereby a substantially uniform ionized field is produced by an electrostatic field from each of the tips of the spikes of the said electrodes to the edges of the nearest aperture of the said plate so as to impress an electrostatic charge on any dust particles entrained in the gas that is caused to flow through the precipitator.

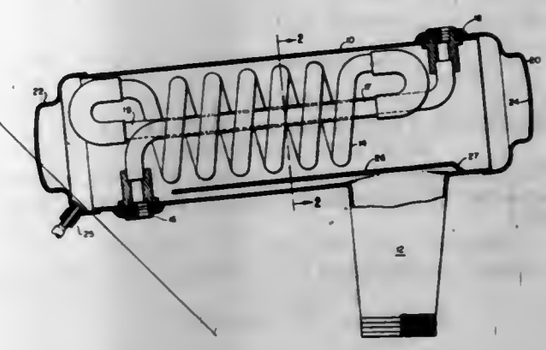
3,271,933
GAS SEPARATION PUMP FOR LIQUID CIRCULATING SYSTEMS
John H. Harker, Park Ridge, Erwin L. Oehlerking, Des Plaines, and Jack Keyes, Park Ridge, Ill., assignors, by mesne assignments, to International Telephone & Telegraph Corporation, New York, N.Y., a corporation of Maryland
Filed Oct. 31, 1963, Ser. No. 320,414
3 Claims. (Cl. 55—203)



1. A centrifugal pump particularly adapted to separate gases entrained in the liquid pumped thereby, said pump comprising a housing having a dynamic separating chamber and a pump discharge chamber, a pump impeller rotating in said dynamic separating chamber, supply and discharge passages to said housing, means defining a fluid collecting and gas collecting static chamber flanking said pump discharge chamber, a partition between said pump discharge chamber and said fluid collecting and gas collecting static chamber, and means providing a passageway from said dynamic separating chamber to said fluid collecting and gas collecting static chamber for the movement of gases so as to separate said gases from the pumped fluid, said means comprising a hollow tube coaxially arranged with respect to said impeller and extending from said static chamber to a point close to said impeller, means in said partition for the movement of gases into said fluid collecting and gas collecting static chamber, said hollow tube providing a return passageway within said pump housing through which liquid which has been detrained of gas may move.

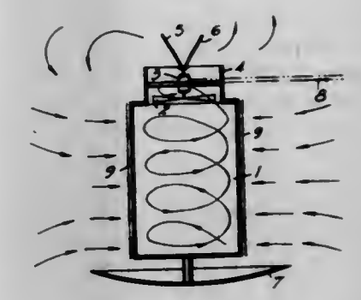
3,271,934
HEAT TRANSFER APPARATUS HAVING MEANS TO SEPARATE CONDENSED LIQUID FROM THE SYSTEM FLUID
James R. Shields, Pittsburgh, Pa., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed June 11, 1962. Ser. No. 201,394
1 Claim. (Cl. 55—269)

A heat transfer unit including a casing, a partition within said casing and extending from the top of the casing to divide the casing into first and second portions, an inlet conduit connected to said first portion and an outlet conduit connected to said second portion to form a path for the flow of gaseous medium through said unit, said path having said first and second portions extending in opposite directions connected by a curved intermediate



portion extending below the lower end of said partition and formed by a curved bottom element, means interposed in said first portion of said flow path above said intermediate portion and below said inlet and outlet conduits for reducing the temperature of the gas flowing in said first portion below its dewpoint, condensate collection and drainage means supported in the curved bottom element of the path to receive condensate deposited by centrifugal action as the gas stream traverses the curved intermediate portion of the path, said condensate collection and drainage means comprising an elongated perforated element supported on the curved bottom element so as to form a drainage space thereunder, a flexible blanket

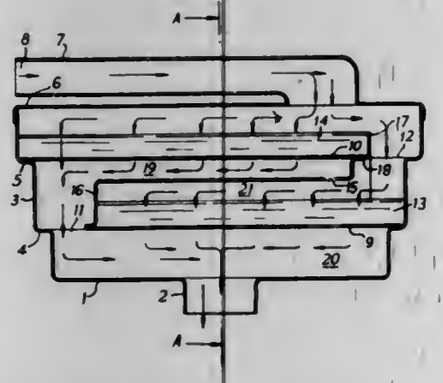
formed of material of fine filaments interwoven on a plurality of layers of strips providing a plurality of randomly oriented non-planar surfaces, the surface of the interwoven member presenting an uneven rough exterior, said blanket overlying the surface of the perforated element remote from that defining the drainage space and substantially throughout the surface of the curved bottom element above said elongated element said blanket providing surfaces to which condensate may cling by surface tension and drain to the bottom of said means by gravity thereby resisting re-entrainment in the gas stream leaving the unit, and conduit means for removing the condensate collecting in the space.



3,271,935
CONDENSER FOR REMOVING VOLATILE MATTER FROM DISTILLATE
Verity C. Smith, Dedham, Mass., assignor to Barnstead Still and Sterilizer Co., Boston, Mass., a corporation of Massachusetts
Filed Apr. 1, 1963, Ser. No. 269,503
1 Claim. (Cl. 55—269)

A water distillation condenser comprising a generally horizontally extending elongate housing closed at both ends, a cooling conduit extending substantially the length of said housing, a generally transverse baffle in said housing positioned beneath the cooling conduit and above the bottom of said housing and sloping downwardly from a first end toward the second end of said housing, a water vapor inlet to the interior of said housing adjacent to the first end of said housing, said baffle overlying said water vapor inlet and forming with said casing a chamber to direct incoming steam from the first end toward the second end and thereafter into contact with said cooling conduit, said chamber being closed except for said vapor inlet and an opening at the lower end of said baffle, a distillate outlet opening from the interior of said housing adjacent to said second end of said housing and positioned below said water vapor inlet, a vent for uncondensed gases in said housing positioned above said water vapor inlet and adjacent to the first end of said housing, a cooling water inlet connecting to the end of said cooling conduit adjacent to said first end of said housing, and a cooling water outlet connecting to the end of said cooling conduit adjacent to said second end of said housing,

said baffle being positioned to collect distillate from said cooling conduit and bring it into counter-current heat exchange relationship with incoming water vapor thereby heating the distillate to remove dissolved uncondensed gases therefrom.



3,271,936
APPARATUS FOR COLLECTING AUTOMATICALLY FIBROUS MATERIALS SUSPENDED IN AIR
Pierre Dauge, St. Martens-Latem, Belgium, assignor to Les Ateliers de Construction Ventola, Societe Anonyme, Ghent, Belgium, a company of Belgium
Filed Mar. 25, 1963, Ser. No. 267,732
Claims priority, application Belgium, Jan. 30, 1963, 627,735
5 Claims. (Cl. 55—302)

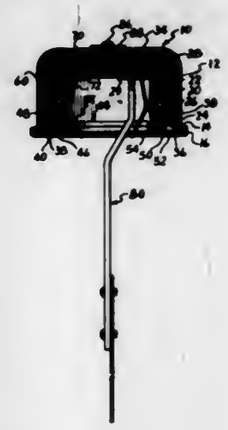
1. Apparatus for automatically collecting dust in suspension in air, comprising in combination, at least one hollow body having a bottom, air pervious walls enclosing a first chamber, impervious walls constituting a continuation of said pervious walls and enclosing a second chamber, and a freely movable member for normal closing of said body, a fan mounted within said hollow body and separating said first chamber from said second chamber, a removable vessel mounted under said hollow body for collecting said dust, means for driving said fan in a predetermined direction, and control means for making said driving means operative and nonoperative, said fan and said means for driving said fan being so constructed and arranged, that when said control means make said driving means operative, to flow a stream of air under pressure from outside said hollow body towards said movable member through said pervious walls and said first and second chambers to displace said movable member into a position wherein said hollow body is open and sucks

dust against said pervious side walls, and whereby when said control means make said driving means inoperative, but before the fan becomes stationary, to reduce the pressure of the air stream to replace said movable member into its normal position and to force the remaining air stream flow within the body from said second chamber towards the outside of said hollow body through said first chamber and said pervious walls due to which dust is blown off said hollow body and falls in said vessel.

3,271,937
FLUID FILTERS FOR INTERNAL COMBUSTION ENGINES
Peter William Stripp, Plymouth, Devon, England, assignor to Tecalemit (Engineering) Limited, Plymouth, Devon, England
Filed July 18, 1963, Ser. No. 296,072
Claims priority, application Great Britain, July 19, 1962, 27,916/63
2 Claims. (Cl. 55—307)

1. A fluid filter for internal combustion engines comprising:

a generally rectangular casing defined by vertical side walls and top and bottom walls and having inlet and outlet openings for the fluid to be filtered, said inlet opening being located in said top wall and said outlet opening in the said bottom wall, the side walls of said casing being stepped such that the cross sectional area of said casing increases from the bottom towards the top thereof to provide at least a pair of steps, each such pair defining a shelf along the inner surface of the side walls with the upper shelf being spaced outwardly of the lower shelf;



a first generally flat filter support resting on the portion of the upper shelf defined by one side wall and by portions of the adjacent side walls and having a free edge spaced from the side wall opposite said one side wall;

a second generally flat filter support resting on the portion of the lower shelf defined by said opposite side wall and portions of said adjacent side walls and having a free edge spaced from said one of said side walls;

filter pads of intermingled fibers carried by each of said supports and generally coextensive therewith; and

a dividing wall with a portion spaced generally parallel between said supports and effectively extending between said adjacent side walls and having a first vertical portion adjacent one end connected to said free edge of the first one of said supports and having means defining a step upon which said free edge rests and having a second vertical portion adjacent the other end connected to said free edge of said second of said supports.

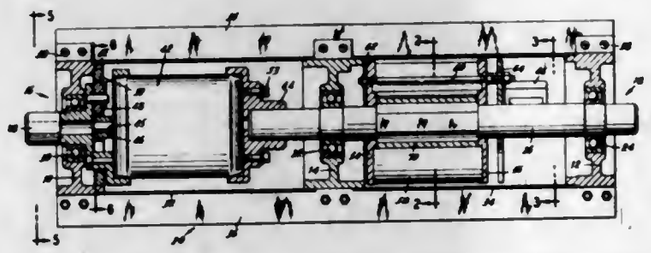
3,271,938
BREATHER CAP AND DIPSTICK COMBINATION FOR AN OIL FILLER PIPE
Frederick G. Rest, Skokie, and David R. Newsted, La Grange, Ill., assignors, by mesne assignments, to Allen Electric and Equipment Company, Kalamazoo, Mich., a corporation of Michigan
Filed June 5, 1963, Ser. No. 285,756
1 Claim. (Cl. 55—385)

A cap for the oil filler pipe of a motor vehicle, said cap comprising:

a cup-shaped member having a cylindrical, substantially vertical side wall, a closed upper end and an open lower end, said cup member having an outwardly extending annular shoulder adjacent the open lower end thereof and an annular skirt portion extending a short distance axially beyond the outer margin of the shoulder and integral with said shoulder;

a dipstick and a leaf spring disposed in said cup member and fixed to the closed upper end thereof by a rivet and washer, said dipstick and leaf spring extending from said closed end through said open end of said cup member and being adapted for insertion into said oil filler pipe upon placement of said cap thereon;

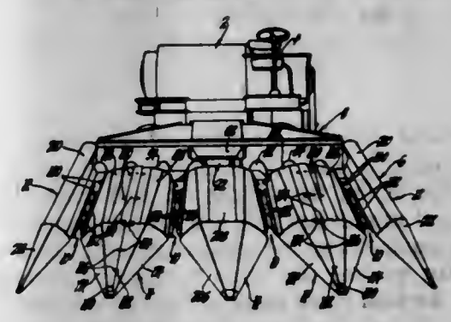
an open ended, flanged sleeve encompassed by, concentric with and carried by said cup member and having an annular vertical wall defining an opening therein for receiving the oil filler pipe, said vertical side wall of said cup member and said annular vertical wall of said sleeve being spaced apart from one another and defining an annular chamber therebetween, said sleeve having an annular flange attached to and extending from the lower end of said annular vertical wall into contact with said skirt portion of said cup member, the lower end of said annular vertical wall being above the lower end of said vertical side wall of said cup member, said flange having at least three similar air passage openings distributed thereover;



an annular filter for said cup member, said filter substantially filling said annular chamber and being retained in position in said annular chamber by said flange, the upper end of said annular vertical wall being spaced apart from both said vertical side wall and said closed upper end of said cup member and defining a passage therebetween, said annular chamber communicating with the space encompassed by the annular vertical wall of said sleeve through said passage;

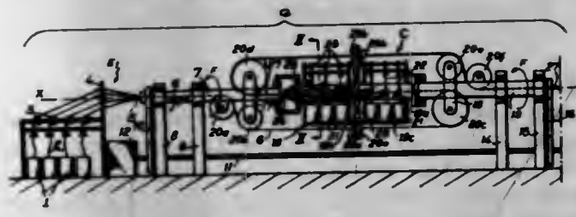
a thin, flat and annular sealing ring carrier member underlying said flange and having an air intake opening generally similar in size to said air passage openings, said air passage openings in said flange being evenly spaced from one another to minimize variation in the resistance to air flow characteristics with a variation in the relative angular positions of said annular carrier member and said annular flange, the outer edge of said carrier member engaging said skirt portion, said skirt portion having an annular bent over portion which clamps said carrier member and said flange between said bent over portion and said annular shoulder, the inner diameter of said carrier member being slightly less than the inner diameter of said annular vertical wall;

a resilient, pliant and sealing ring attached to said carrier member and disposed in said oil filler pipe receiving opening, said sealing ring having an opening therein for receiving the oil filler pipe and bounded by a pliant, upwardly converging wall portion, said wall portion being thin measured in a radial direction, said wall portion extending inwardly of said annular, vertical wall, the upper end of said upwardly converging wall portion being spaced apart from said annular vertical wall and said annular flange, the inner margins of said sealing ring wall portion being of lesser diameter than the smallest expected dimension of the oil filler pipe and being readily expandable to form an air tight seal with an irregularly shaped oil filler pipe to prevent air from by-passing the filler pipe, there being a substantial clearance space outside of said sealing ring for the outward expansion of said sealing ring when applied over said oil filler pipe;



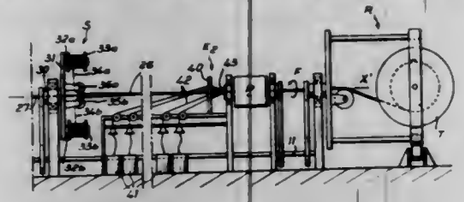
a portion of said sealing ring together with said annular flange and said annular carrier member defining an annular channel in said cup member which communicates with the atmosphere through said air intake opening and with the space occupied by said filler through said air passage openings in said annular wall, said annular channel being formed by a depressed portion in said annular flange spaced away from said annular carrier member, said sealing ring having a continuous annular ridge which seals against said annular flange at points inwardly of the inner margin of said annular channel to prevent air entering the annular channel from by-passing the filter chamber, said carrier member and said annular flange being spaced apart at all points except for those portions of said annular flange and said carrier member which are clamped between said bent over skirt portion and said annular shoulder.

3,271,939
POWERED UNIT FOR A LAWN MOWER OR SIMILAR DEVICE
Fred L. Granger, Jr., Cleveland, Norman M. Potter, Rocky River, and Alan D. Smith, Fairview Park, Ohio, assignors to Union Carbide Corporation, a corporation of New York
Filed Dec. 19, 1963, Ser. No. 331,681
6 Claims. (Cl. 56—26)



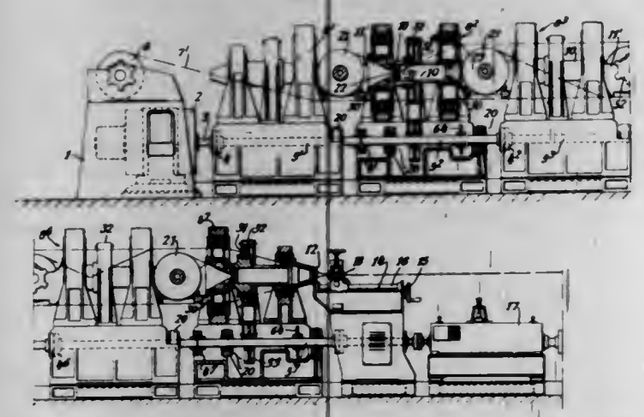
1. A lawn mower comprising a frame having a cutter bar and extending handle bars and having ground engaging wheels for rotatably supporting said lawn mower for movement over the ground, a first and second stationary shaft having a D.C. motor interposed therebetween, one of said shafts having a plurality of secondary batteries disposed thereabout and between a pair of end plates attached thereto, said second shaft having means operatively connecting said motor and a reel blade assembly rotatively mounted about said first and second stationary shafts, said batteries being connected to said motor whereby said reel blade assembly is caused to rotate about said stationary shafts.

3,271,940
CORN HARVESTER
Robert Ashton, Islington, Ontario, Myron Leroy Gullickson, Albion Township, Ontario, and James G. Butler, Islington, Ontario, Canada, assignors to Massey-Ferguson Limited, Toronto, Ontario, Canada, a corporation of Canada
Filed Dec. 5, 1963, Ser. No. 328,324
36 Claims. (Cl. 56—105)



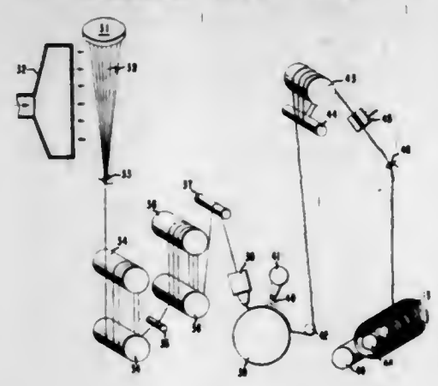
1. A harvesting attachment adapted to be removably mounted on a combine for simultaneously harvesting a plurality of spaced crop rows; said attachment comprising main frame means, a harvesting unit for each crop row, mounting means mounting said units in laterally spaced relation on said main frame means in accordance with the spacing of the crop rows, said mounting means for at least one of said units laterally adjustably mounting the latter relative to an adjacent unit to vary the lateral spacing therebetween, power operated means independent of said mounting means mounted on and laterally adjustable with respective ones of said adjacent units to drive the latter in any adjusted position thereof, means for conducting power to one of said power operated means, and coupling means adjustably drivingly coupling said one of said power operated means to the other thereof to transmit power therebetween while accommodating variation in the lateral spacing between said adjacent units.

3,271,941
MACHINES FOR MANUFACTURING MULTI-CORE CABLES
Otto Haugwitz, La Celle-Saint-Cloud, France, assignor to Societe Anonyme Geoffroy-Delore, Paris, France, a French company
Filed Apr. 7, 1964, Ser. No. 358,038
Claims priority, application France, Apr. 11, 1963, 931,208
5 Claims. (Cl. 57—15)



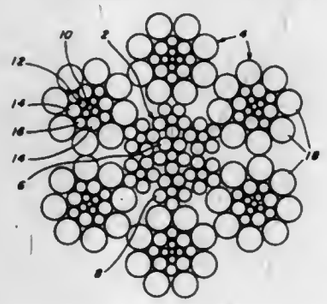
1. A machine for manufacturing in one single pass a multi-layer cable of equal twist in alternate directions, comprising a first cabling assembly comprising a simple twist cabling unit arranged to take up elementary strands from a fixed supply frame, and a rotatable stirrup cabling unit, a plurality of rotatable stirrup cabling units equal

in number to the number of layers desired in the cable located successively beyond said first assembly, and a receiver assembly for the finished multi-layer cable, each of said rotatable stirrup cabling assemblies comprising in combination: two rotating coaxial half-stirrups provided with means for guiding the cable already formed parallel to the axis of rotation along which the cable moves in its direction of travel and further guide means for directing the cable in the opposite direction along the axis of rotation, a support carried by said two half-stirrups and free in rotation with respect thereto, said support being freely traversed by the cable passing in the said opposite



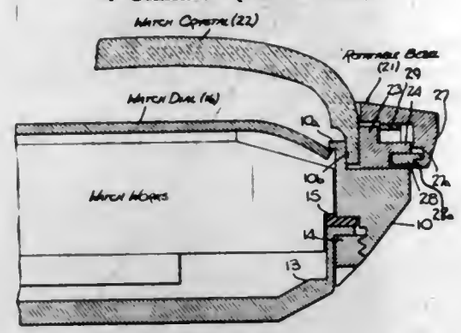
direction and carrying a supply of elementary strands, a distribution grid and an assembly guide plate on said support for laying the strands on said cable, means for guiding said strands towards said distribution grid and said assembly guide plate, and means carried by said two half-stirrups for guiding the cable thus formed from its outlet from the said guide plate to the axis of rotation in the direction of travel of said cable beyond said two half-stirrups, said guiding means carried by said two half-stirrups causing the cables to change directions at tangents compatible with the rigidity of said cable and preventing said cables from rotating about their own axes as they pass on said guide means.

3,271,942
APPARATUS FOR THE MAKING OF STRANDS, ROPES, CABLES AND THE LIKE
Vincent Patrick Griffin, Ashton-under-Lyne, England, assignor to Olympic Stranding Machinery Limited, Manchester, England
Filed Jan. 21, 1964, Ser. No. 339,231
Claims priority, application Great Britain, Jan. 26, 1963, 3,339/63; May 16, 1963, 19,562/63
9 Claims. (Cl. 57—58.32)



1. A stranding machine incorporating a series of separate, independent and co-axially aligned heads, each head including an upper rotating carrier section and a lower drive shaft section, cradles supporting the wire-supply bobbins between the rotating carrier sections of adjacent heads, each rotating carrier section consisting of a tubular rotor having large-diameter ends, and axially-spaced, large-diameter encircling bearings in the associated head for mounting said large-diameter ends, the diameter of the bearings being such that they permit free passage of the wires from individual bobbins in the cradles between adjacent carriers, and each drive shaft section comprising a drive shaft, an endless drive connecting the drive shaft to the corresponding rotor, coupling means at each drive shaft end for connecting same to adjacent drive shafts so that the drive shafts are rotated synchronously, and a brake on each drive shaft section so that both driving and braking forces can be transmitted to the rotating carrier section of each head from the drive shaft section of each head, first wire guide means on the cradle and second wire guide means on the large-diameter ends of each rotating carrier section to constrain wire fed from the wire supply bobbin of each cradle to follow a straight-line path disposed parallel to the axis of the machine.

3,271,943
PROCESS FOR STABILIZING BULKED YARNS AND PRODUCT THEREOF
Ebenezer David Williams, Jr., Seaford, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Dec. 30, 1963, Ser. No. 334,435
8 Claims. (Cl. 57—140)

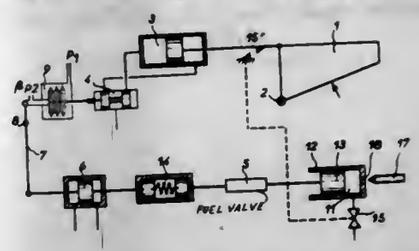


1. Method for reducing the extensibility of a bulky yarn composed of crimped continuous filaments of a polyamide, said method comprising applying liquid water to a running length of the yarn at normal temperatures while the yarn is under a tension of at least 0.02 gram per denier and winding the water-treated yarn under tension into a package, the quantity of water applied to the yarn being at least 50% of the equilibrium content of the filaments at 100% relative humidity as measured at 20° C.

3,271,944
STRANDED WIRE STRUCTURES
Roger W. Stevens, Woodbury, Conn., assignor to United States Steel Corporation, a corporation of New Jersey
Filed May 1, 1964, Ser. No. 364,255
4 Claims. (Cl. 57—145)

1. A stranded wire structure comprising a center wire, four wires of equal diameter stranded around said center wire, eight wires stranded around four wires, four of said eight wires being of equal diameter and the other four of said eight wires being of an equal diameter smaller than the diameter of the first mentioned four wires of said eight wires, the smaller diameter wires being arranged alternately with the larger diameter wires, and eight wires of equal diameter stranded around said first named eight wires.

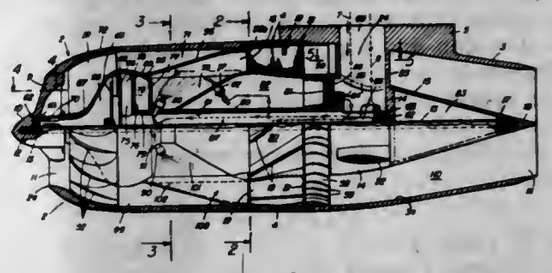
3,271,945
WATCH CASING WITH ROTATABLE BEZEL
David H. Anderson, Providence, R.I., assignor to Bulova Watch Company, Inc., New York, N.Y., a corporation of New York
Filed Dec. 2, 1964, Ser. No. 415,251
4 Claims. (Cl. 58—43)



1. A watch casing for a watch works having a special hand making one full revotution per twenty-four hours; said casing comprising a fixed bezel for housing said works, a crystal mounted on said bezel to expose said special hand, and a removable sub-assembly constituted by a holding ring surrounding said crystal to secure same in place, said ring having an outwardly extending flange forming a circular trackway, a time-calibrated movable bezel encircling said crystal and having a downwardly extending sleeve surrounding said trackway and provided on the inner surface with an annular groove, a split friction washer concentric with said holding ring and engaging the underside of said trackway, the periphery of said friction washer being received within said groove to lock said movable bezel to said ring, and an annular tension spring interposed between said trackway and said calibrated bezel, whereby the elements of said sub-assembly lock together to form a unit which is capable of being pressed over said crystal or of being removed therefrom in a single operation.

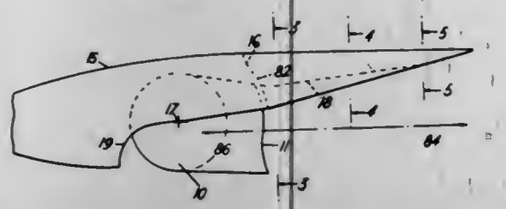
ERRATUM

For Class 60—35.3 see:
Patent No. 3,272,770



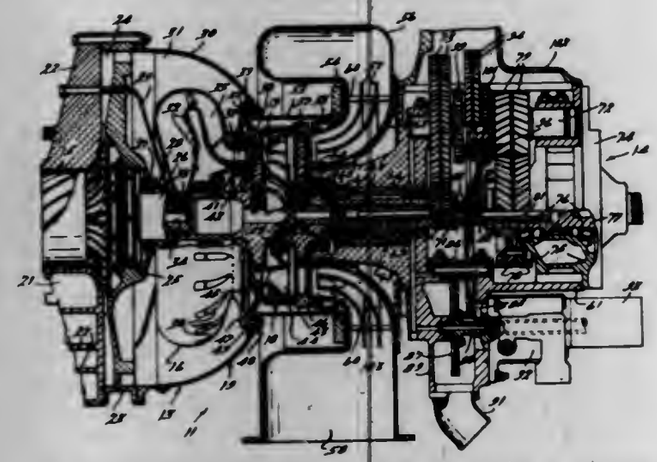
3,271,946
ACCELERATING ARRANGEMENT FOR GAS-TURBINE JET ENGINES
Andre Pierre Desmazes, Saint-Maur, and Roger Henri Tissier, Paris, France, assignors to Societe Nationale d'Etude et de Construction de Moteurs d'Aviation, Paris, France, a company of France
Filed Apr. 16, 1964, Ser. No. 360,318
Claims priority, application France, Apr. 26, 1963, 932,876
11 Claims. (Cl. 60—35.6)

1. In a gas-turbine jet engine having a propulsion nozzle, nozzle area varying means, first fluid-operated jack means for controlling the nozzle area varying means, a device for the metered supply of fuel, second jack means controlling opening and closing of said fuel supply device, control means actuable to initiate operation of said second jack means to open said fuel supply device and thus to cause acceleration, and a fluid distributor controlling the supply of operating fluid to said first jack means in response to operation of said fuel supply device, an accelerating arrangement comprising a yieldable connecting device between said fuel supply device and said second jack means in the direction to open said fuel supply device, and releasable stop means operable upon actuation of said control means, to prevent opening of said fuel supply device and thus to cause said yieldable connecting device to be compressed during the time when said nozzle area varying means is



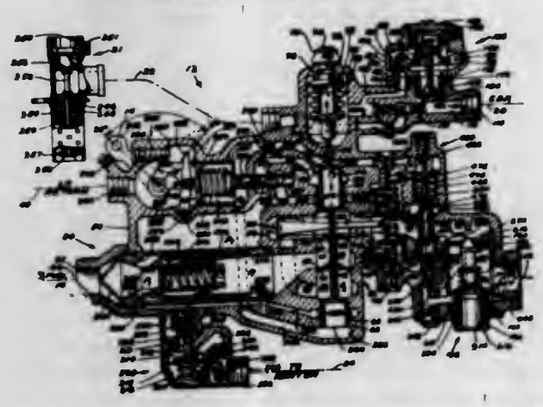
being operated to open said nozzle, said stop means being releasable when said propulsion nozzle has been opened, thereby allowing opening of said fuel supply device under the action of expansion of said yieldable device.

3,271,947
CONTINUOUS PRESSURE JET PROPULSION ENGINE
Miklos Kemenczky, Point Pleasant, N.J., assignor to Kemenczky Establishment, Vaduz, Liechtenstein, a corporation
Filed May 12, 1964, Ser. No. 366,793
6 Claims. (Cl. 60—35.6)



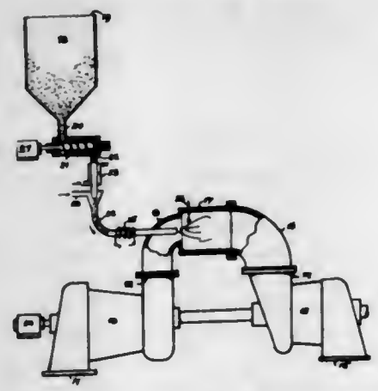
1. A jet propulsion engine comprising a thrust tube having a fluid inlet opening and a fluid discharge opening, a plurality of work chambers arranged about the periphery of the inner surface of a central portion of said thrust tube, said work chambers having inlet openings and outlet openings, a rotating unit comprising a centrifugal pump mounted within said thrust tube at said fluid inlet opening, said centrifugal pump comprising a plurality of blades adapted to pump fluid entering said fluid inlet opening into said thrust tube and to cause said fluid to rotate within said thrust tube in a generally spiral manner, at least one channel rigidly attached to said rotating unit and having an outlet opening at one end, said outlet opening being of substantially the same size as an inlet opening of any one of said work chambers, and a turbine wheel rigidly connected to said rotating unit and located downstream of said work chambers, a fuel injection means and ignition means and air inlet means mounted within said thrust tube, said centrifugal pump being adapted to direct a mixture of fluid from said fluid inlet opening and air from said air inlet means about the periphery of the inner portion of said thrust tube, whereby a hollow cylinder of water is formed therein, which cylinder of water defines an inner combustion chamber containing said fuel nozzle and said ignition means, said combustion chamber being fed by air which is removed from said fluid-air mixture by the centrifugal action exerted on said mixture, said channel being adapted to carry hot combustion gases from said combustion chamber whereby, during rotation of said channel, said work chambers are alternately fed by said fluid and by said hot combustion gases said turbine wheel receiving said fluid and said gases and said discharge opening located downstream of said turbine.

3,271,948
VARIABLE AREA NOZZLES
John R. D. Fuller, Bristol, England, assignor to Bristol Siddeley Engines Limited, Bristol, England, a British company
Filed Aug. 17, 1964, Ser. No. 390,094
Claims priority, application Great Britain, Aug. 23, 1963, 33,496/63
9 Claims. (Cl. 60—35.55)



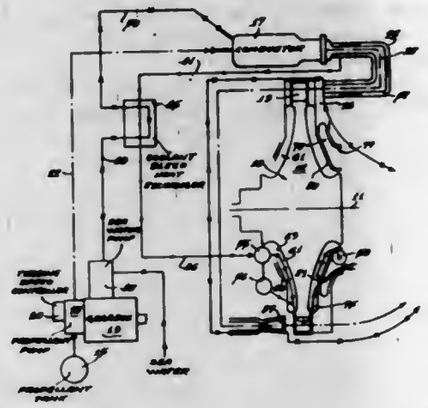
1. A variable area jet nozzle system comprising a nozzle having an outlet defined by a lip, and an external visor for selective partial blanking-off of the outlet, the nozzle and visor being capable of relative rotary movement about an axis which lies transverse to the discharge from the outlet and which lies upstream of the outlet, the lip thereby having an arcuate track of movement relative to the visor, the visor being shaped to have an operative edge which by the relative movement is carried between an inoperative position clear of the track and an operative position extending fully across and close to an end portion of the track, and the visor having a flow control surface extending downstream from its operative edge in a direction and for a sufficient distance to constitute an important factor in determining the direction of thrust of the system when the nozzle outlet is partially blanked-off by the visor.

3,271,949
GAS TURBINE
John F. Jones, Berkley, Jack J. Benson, Detroit, and Sam B. Williams, Walled Lake, Mich., assignors to Williams Research Corporation, Walled Lake, Mich., a corporation of Michigan
Filed Apr. 26, 1963, Ser. No. 275,835
5 Claims. (Cl. 60—39.16)



1. In a gas turbine, a power head having a housing, a compressor, burner, first stage nozzle vanes, first stage turbine wheel, and second stage nozzle vanes axially arranged in the order related, duct means connecting said compressor and burner, means conducting gases from said burner to said first stage nozzle vanes, from said first stage nozzle vanes to said first stage turbine wheel, and from said first stage turbine wheel to second stage nozzle vanes, a gear box housing having gearing and a second stage turbine wheel axially alined with and adjacent said second stage nozzle vanes, shaft means connecting said second stage turbine wheels and said gearing, an exhaust duct disposed between said power head and gear box and extending radially outwardly, a plurality of circumferentially spaced tubes extending axially through said exhaust duct and open to atmosphere, and supporting means for said power head comprising a plurality of elongated fasteners extending through and spaced radially from said tubes to provide a cooling space therebetween, one end of each fastener being secured to said gear box housing and the other end to said power head housing.

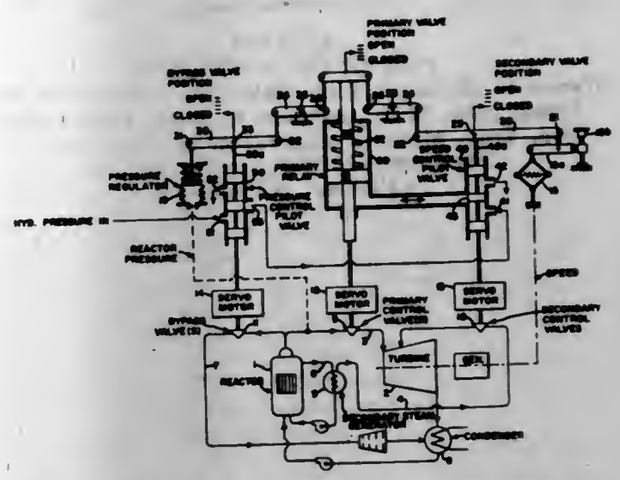
3,271,950
GAS TURBINE FUEL CONTROL
Ralph P. McCabe, Warren, and Dean F. Wheeler, Detroit, Mich., assignors to Holley Carburetor Company, Warren, Mich., a corporation of Michigan
Filed Dec. 20, 1963, Ser. No. 331,996
13 Claims. (Cl. 60—39.28)



1. A fuel control for a gas turbine engine having a pneumatic pressure source and a fuel system including an engine driven centrifugal pump, said fuel control comprising an acceleration fuel system including a throttling valve controlled by a force balance lever operatively connected thereto, means for moving said lever in response to said pneumatic pressure, feed-back means for moving said lever in response to changes in fuel flow to said engine, and governor means for balancing said lever in response to changes in engine speed as indicated by pump pressure rise.

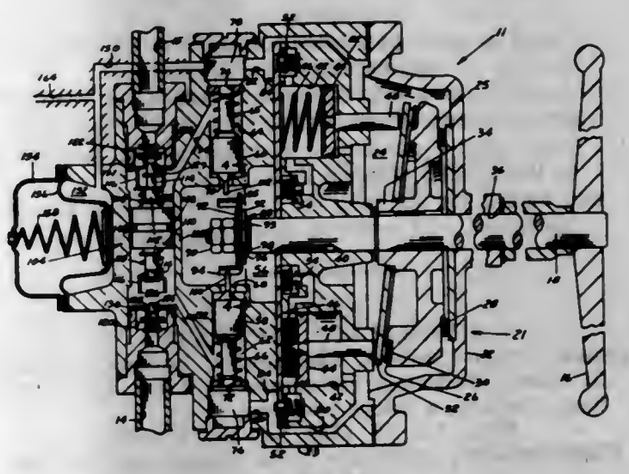
3,271,951
GAS TURBINES USING SOLID FUELS
Frederick Nettel, 173 Chapel Road, Manhasset, Long Island, N.Y.
Filed Oct. 22, 1963, Ser. No. 318,028
3 Claims. (Cl. 60—39.46)

1. In the method of fueling a gas turbine plant with hydrocarbons substantially completely vaporizable by heating them and having melting points between ambient temperatures and +250° C., said gas turbine plant comprising air compressor means, gas turbine means, conduit means connecting the outlet of said compressor means with the inlet of said gas turbine means, combustion chamber means interposed in said conduit means, the steps of introducing particulate solid fuel into the stream of hot compressed air issuing from said compressor means, for melting and evaporating said fuel by the heat of compression of said air, and subsequently burning the resulting vapors in said air.



3,271,952
TURBINE COOLING DEVICE
David H. Silvern, North Hollywood, Calif., and Kenneth E. Nichols, Arvade, Colo., assignors to Sundstrand Corporation, a corporation of Illinois
Filed Aug. 14, 1964, Ser. No. 389,622
9 Claims. (Cl. 60—39.66)

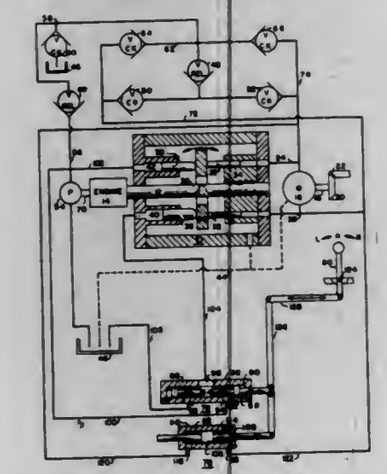
5. In a hot gas turbine for delivering power in an environment where a source of cooling air is not readily available, the combination comprising: a self contained self supporting combustion system including a combustor for burning a propellent and producing hot combustion products without employing atmospheric air, a turbine wheel mounted for rotation, a distributor connecting said combustor to said turbine wheel for rotation thereof, shroud means adjacent said turbine wheel having passages therein for directing cooling fluid adjacent said wheel, a heat exchanger, means for delivering only combustion products to said heat exchanger for cooling said combustion gases, means connecting said heat exchanger to said passages to deliver cooled combustion gases directly to said passages, means for exhausting at least a major portion of the cooling gas from the turbine, and a fluid pump for delivering fluid to said heat exchanger to cool said combustion gases, whereby cooled combustion gases provide a cooling fluid in the absence of atmospheric air.



3,271,953
COMPOUND CONTROL SYSTEM FOR A TURBINE
Robert L. Carson, Scotia, N.Y., assignor to General Electric Company, a corporation of New York
Filed May 24, 1965, Ser. No. 458,334
5 Claims. (Cl. 60—43)

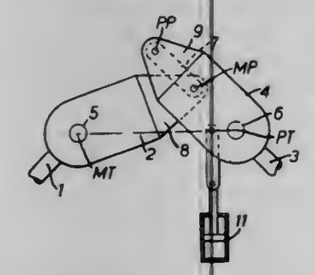
1. A control system for a turbine supplied with motive fluid from a pressure source comprising:
(a) a primary valve connected to control flow of motive fluid from said pressure source to said turbine,
(b) an additional valve connected to control motive fluid from said source so as to adjust any unbalance between motive fluid flow generated by the pressure source at a given pressure and motive fluid flow required by the turbine at a given load,
(c) first means responsive to motive fluid pressure including a first pilot valve controlled thereby,
(d) second means responsive to the speed of said turbine including a second pilot valve controlled thereby,
(e) a primary servomotor controlled jointly by said first and second pilot valves and arranged to move said primary valve toward a more open position upon increase in motive fluid pressure or decrease in turbine speed respectively, said pilot valves being connected so that the pilot valve requesting the lowest primary valve position overrides the other pilot valve to exercise sole control over the primary servomotor while the overridden pilot valve moves in an unrestricted

manner, whereby the motion of the overridden pilot valve indicates the potential unbalance in motive fluid flow between pressure source and turbine, and
(f) an additional servomotor connected to actuate said additional valve to correct said unbalance in response to movements of the overridden pilot valve.



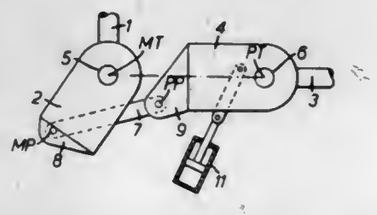
3,271,954
REMOTE CONTROL POSITIONING DEVICE
Frederick J. Marsee, Hazel Park, Raymond A. Seeters, Royal Oak, and Frank C. Karasinski, Jr., Utica, Mich., assignors to Holley Carburetor Company, Warren, Mich., a corporation of Michigan
Filed Mar. 30, 1965, Ser. No. 443,888
8 Claims. (Cl. 60—52)

1. A positioning device, comprising a servo mechanism including a wobble plate type pump having a reservoir, a shaft connected at an intermediate point thereof to said pump and having one end thereof extending from said servo mechanism, a friction clutch mechanism mounted on the inner end of said shaft, a pair of actuating valves independently operated by said clutch mechanism depending upon the direction of rotation of said shaft, a plurality of pistons successively operated by rotation of said wobble plate pump, a conduitry system communicating between said pistons and the ends of said actuating valves, a lockout system, a pair of passageways communicating between said actuating valves and said lockout system, an accumulator and a conduit communicating between said reservoir and said accumulator; an external



operable member fixedly secured to the extension of said shaft; and a slave mechanism including a housing having a piston slidably mounted therein, a piston rod extending from one end of said piston and out through one end of said housing, and a pair of conduits communicating between opposite ends of said piston and said lockout system.

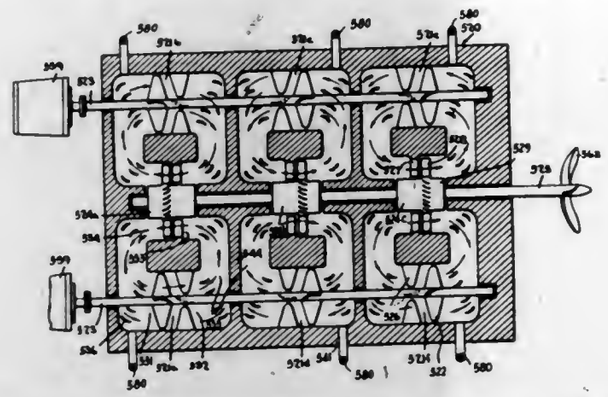
3,271,955
POWER TRANSMISSION
Werner G. Holzbock, Bloomfield Hills, and Carel J. Mali, Union Lake, Mich., assignors to Sperry Rand Corporation, Troy, Mich., a corporation of Delaware
Filed Apr. 12, 1965, Ser. No. 447,374
8 Claims. (Cl. 60—53)



1. In a hydraulic transmission for controlling the acceleration of a fluid motor, the combination of:
a pump connected to said motor and having a power operated displacement varying mechanism;
control means for regulating said power operated displacement varying mechanism, said control means having a neutral position from which it is movable to accomplish regulation;
an input member connected to said control means and capable of varying degrees of movement;
a movable, pressure differential responsive feedback device connected to said control means, said device producing a movement proportional in magnitude to the applied pressure differential;
and means for applying the pressure differential existing across said motor to said feedback device.

3,271,956
HYDRAULIC APPARATUS
Dennis Ernest Lambeth, Cheltenham, England, assignor to Dowty Technical Developments Limited, Cheltenham, England, a British company
Filed Apr. 15, 1965, Ser. No. 448,296
Claims priority, application Great Britain, Apr. 18, 1964, 16,185/64
5 Claims. (Cl. 60—53)

1. A hydraulic power transmission comprising a tilting head pump unit in hydraulic connection with a tilting head motor unit, a support locating the tilt axes and the drive shafts in fixed relative positions in which the tilt axes are parallel to one another, a link of fixed length having a pair of spaced pivots connecting the link respectively to the pump head and to the motor head, the pivots having axes parallel to the tilt axes and being attached to the heads either directly or through extensions whereby the spacing for each head between the tilt axis and the pivot axis forms a lever arm, the whole arrangement being such that during tilt movement of the heads a position is obtainable, referred to as pump dead centre, in which the motor pivot axis lies between and in one plane with the pump tilt axis and the pump pivot axis.

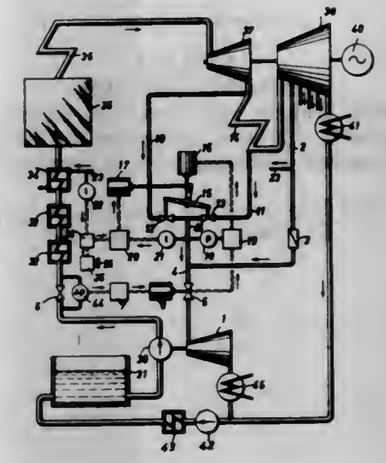


3,271,957
HYDRAULIC APPARATUS
Dennis Ernest Lambeth, Cheltenham, England, assignor to Dowty Technical Developments Limited, Cheltenham, England, a British company
Filed Apr. 15, 1965, Ser. No. 448,297
Claims priority, application Great Britain, Apr. 18, 1964, 16,186/64
4 Claims. (Cl. 60—53)

1. A hydraulic power transmission comprising a tilting head pump unit in hydraulic connection with a tilting head motor unit, a support carrying the two units and locating the tilt axes and the drive shaft in fixed relative positions in which the axes are parallel to one another, a link of fixed length having a pair of spaced pivots connecting the link respectively to the pump head and to the motor head, the pivots being attached either directly to the heads or by extensions whereby the spacing for each head between the tilt axis and the pivot axis forms a lever arm, the pivot axes being parallel to the tilt axes, the arrangement being such that when the pivot axes lie in one plane with the pump tilt axis, i.e. pump dead centre position, the link extends from the pump pivot and the combined length of the pump lever arm and the link is greater than the space between the tilt axes.

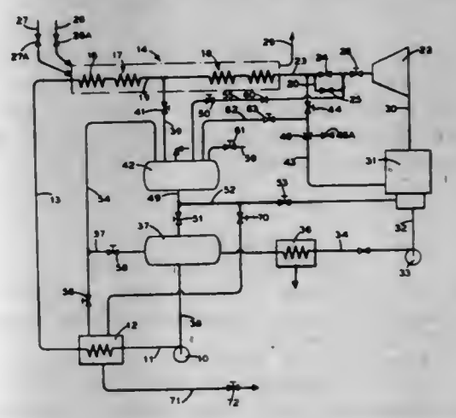
3,271,958
HYDRAULIC TORQUE CONVERSION APPARATUS
Leonard Meyerhoff, Brooklyn, N.Y., assignor to Eastern Research Group, a partnership
Original application Feb. 25, 1960, Ser. No. 11,057. Divided and this application Apr. 6, 1964, Ser. No. 357,730
7 Claims. (Cl. 60—54)

1. Hydraulic transmission apparatus employing a high mass flow of fluid for transmitting high power from a plurality of drive shafts each having a high rotational speed to a driven shaft having a comparatively low rotational speed, the drive shaft-to-driven shaft speed reduction ratio of the apparatus being in the range extending upwardly from the ratio of about four-to-one, said apparatus comprising a plurality of impeller shafts, each of said impeller shafts being adapted to engage a different one of said plurality of drive shafts, a plurality of comparatively high volume output type single stage axial flow pumps coupled to each of said impeller shafts, each of the pumps having a transmission fluid outlet opening, a plurality of turbines each being of the axial flow type having a fluid passage therethrough of substantially constant cross-section, each turbine of said plurality of turbines being adapted to engage said driven shaft and having a transmission fluid entrance opening in communication with substantially the complete periphery of said turbine to enable said turbine to be fully wetted by the flow of fluid therethrough, said fluid entrance opening of each of the turbines being comparatively spaced apart from said fluid outlet opening of each of the pumps, duct means extending between said fluid entrance opening of each of the turbines and said fluid outlet opening of a



different one of the pumps of each of the impeller shafts to provide a passageway for transmission fluid for interconnecting the pumps and the turbines, and means for supplying said fluid to said pumps, the ratio of the speed of rotation of each of said pumps for providing a predetermined flow of fluid therethrough to the speed of rotation of said turbine interconnected therewith for receiving said predetermined flow therefrom being in the range extending upwardly from about four-to-one, whereby the speed of rotation of said turbines and said driven shaft when said apparatus is transmitting high power is substantially less than that of said drive shaft.

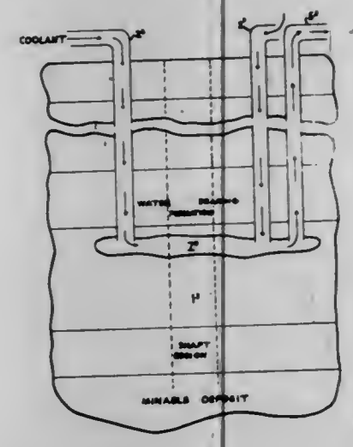
3,271,959
DEVICE FOR UTILIZING THE ENERGY PRESENT IN ROLLING WAVES OF WATER
Adrianus W. van Gils, Seria, Brunei, British Borneo
Filed Jan. 14, 1965, Ser. No. 425,485
4 Claims. (Cl. 60—55)



1. A device to be placed in a body of water in the vicinity of rolling waves of the water to utilize the energy of the rolling waves comprising a water turbine or motor, an inlet tube for directing water to the turbine or motor for driving the same and an outlet tube for directing water from the trubine, the inlet tube having a plurality of inlet valves only permitting entry of the water from the body of water into the inlet tube and the outlet tube having a plurality of valves only permitting the exit of the water from the outlet tube into the body of water, both of said tubes being positioned in substantially the same plane, so that when the crest of a wave passes over a valve in the inlet tube the greater hydrostatic presure will permit the water to enter the inlet tube and so that when a trough of a wave passes over a valve in the outlet tube the lower hydrostatic pressure will permit the water to flow out of the outlet tube whereby the turbine or motor is driven by a difference in the hydrostatic pressure between the crests and troughs of the waves.

3,271,960
METHOD AND APPARATUS FOR SUPPLY OF STEAM TO AN AUXILIARY TURBINE IN A STEAM POWER PLANT
Alfred Brunner, Winterthur, Switzerland, assignor to Sulzer Brothers Limited, Winterthur, Switzerland, a company of Switzerland
Filed Feb. 28, 1964, Ser. No. 348,140
Claims priority, application Switzerland, Mar. 1, 1963, 2,703/63
10 Claims. (Cl. 60—67)

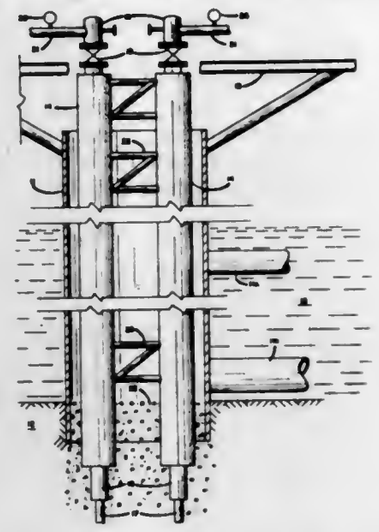
5. In a steam power plant having a high pressure main turbine, a steam reheating surface, and a low pressure main turbine connected in series for steam flow, apparatus for the supply of steam to an auxiliary turbine comprising means to withdraw steam from a stage of said low pressure turbine, separate means to withdraw steam both upstream and downstream of said surface, and valve means included in at least one of said separate withdrawal means.



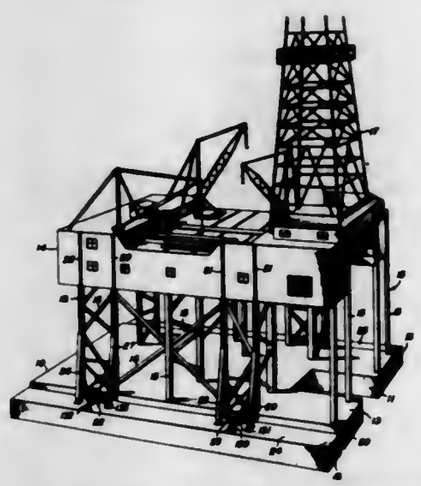
3,271,961
START-UP SYSTEM FOR FORCED FLOW VAPOR GENERATOR
Murray Wiener, Akron, Ohio, assignor to The Babcock & Wilcox Company, New York, N.Y., a corporation of New Jersey
Filed Oct. 22, 1964, Ser. No. 405,685
5 Claims. (Cl. 60—105)

1. The method of starting a power plant system in which, during normal operation, vaporization fluid is successively passed through a heating zone and a superheating zone to a vapor turbine, said method comprising passing a vaporizable fluid under substantial pressure through the heating zone in indirect heat transfer relation

with heating gases, passing a portion of the heating zone fluid outflow to a separating zone while reducing its pressure to cause part of the fluid to flash into vapor, passing the remaining portion of the heating zone fluid outflow to and through the superheating zone in indirect heat transfer relation with the heating gases, effecting separation of the vapor portion of the fluid in the separating zone, passing separated vapor from the separating zone to a position downstream of the superheating zone for mixing with superheating zone vapor outflow, passing the vapors so mixed to the turbine for rolling and loading thereof.



3,271,962
MINING PROCESS
James Bowen Dahms and Byron P. Edmonds, Regina, Saskatchewan, Canada, assignors to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed July 16, 1964, Ser. No. 383,123
21 Claims. (Cl. 61—36)



21. A method of freezing a selected zone extending through a subterranean water-bearing stratum which comprises establishing beneath a level where water is disposed a subterranean passage which intersects said zone, establishing a cased hole extending through said stratum and openly communicating with said passage, establishing a further cased hole sufficiently removed from the first-named cased hole to be out of substantial heat transfer relationship therewith, said further cased hole extending through said stratum and openly communicating with said passage, feeding a liquid having a temperature below 0° C. through the first-named hole with flow through said stratum into the passage and withdrawing said liquid from said passage through said further cased hole until said selected zone is frozen.

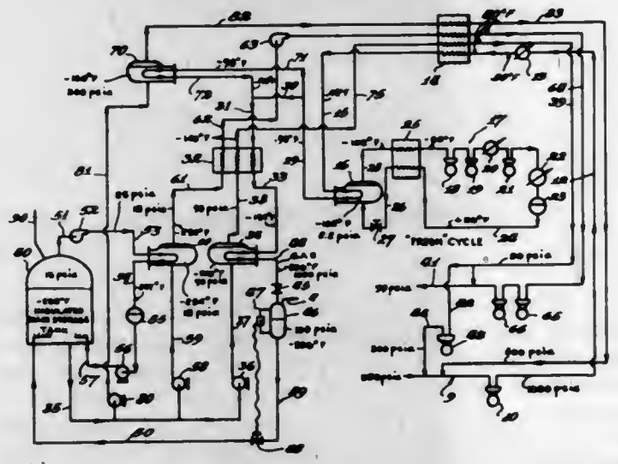
3,271,963
MARINE STRUCTURE
Kenneth A. Blenkarn, Tulsa, Okla., assignor to Pan American Petroleum Corporation, Tulsa, Okla., a corporation of Delaware
Filed Feb. 13, 1964, Ser. No. 344,645
2 Claims. (Cl. 61—46)

1. A marine structure comprising a large-diameter tubular member having its lower end affixed to a formation underlying a body of water and extending upwardly from said formation to a point above the surface of the water; a conduit member having its lower end connected to a well in said formation and extending upwardly from said well to the surface of the water; said conduit member being positioned inside said large-diameter member and structurally isolated therefrom continuously above a point adjacent said formation, whereby vibrations induced in said large-diameter member are prevented from being transmitted to said conduit member; and a well head assembly mounted on said conduit member above the surface of the water; and a platform supported by said large diameter tubular member and isolated from said well head assembly.

3,271,964
METHOD OF OPERATING A SUBMERSIBLE BARGE FOR SUBMARINE OPERATIONS
Paul A. Wolff, Morgan City, La., assignor to Kerr-McGee Oil Industries, Inc., a corporation of Delaware
Original application Oct. 21, 1955, Ser. No. 541,998, now Patent No. 3,099,912, dated Aug. 2, 1963. Divided and this application Nov. 30, 1961, Ser. No. 161,761
6 Claims. (Cl. 61—46.5)

1. Method of operating a submersible barge to effect submergence thereof to the underlying land bottom of a body of water,

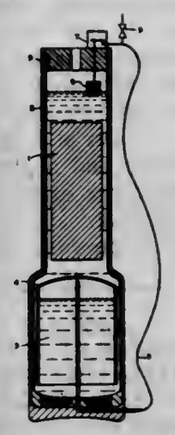
the barge being of the type having a main section including a floatable hull connected to an upstanding open structure supporting a platform spaced above the hull and a pair of pontoon sections located outboard of the main section on opposite sides thereof with the main section and the pontoon sections being mounted for relative individual movement in upward and downward directions to different positions along predetermined paths including a first position in which the center of displacement of the pontoon sections is at substantially the same level as the center of displacement of the hull, a second position in which the center of displacement of the pontoon sections is displaced a maximum distance above the level of the center of displacement of the hull and successive positions from the center of displacement intermediate the first and second positions,



the method comprising the steps of floating the barge on the body of water by the buoyance of the pontoon sections with the hull and the pontoon sections in the first position and each having freeboard,

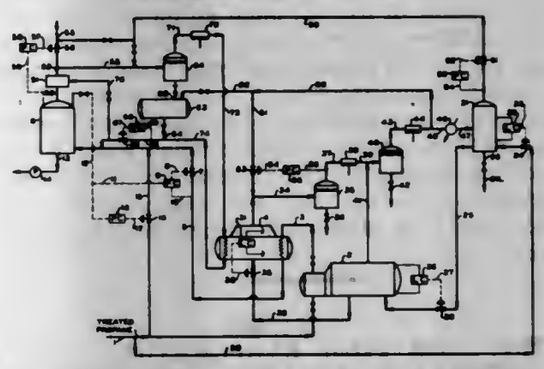
applying a force of controlled variable magnitude between and onto the main section and the pontoon sections and by said force moving the hull at selected rates further from the center of displacement of the pontoon sections in one direction from the first position and toward the land bottom, and restraining movement of the sections relatively upwardly of the first position in a direction opposite said one direction while said force is applied between the hull and the pontoon sections,

continuing application of said force and moving thereby the hull relative to the center of displacement of the pontoon sections further in said one direction toward the second position and into contact with the land bottom while continuing said restraining movement of the pontoon sections while continually maintaining the pontoon sections with freeboard to stabilize the barge,



and changing the magnitude of the controlled force in accordance with extraneous forces applied to the sections and changes in buoyancy thereof during such submergence to vary the rate and attitude of submergence of the hull to the underlying land bottom.

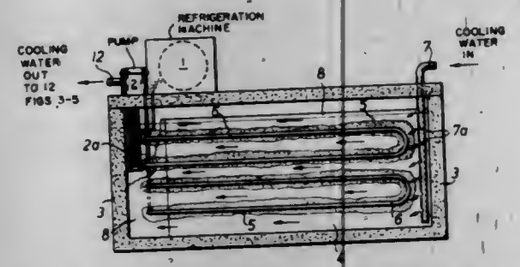
3,271,965
METHANE LIQUEFACTION PROCESS
James B. Maher and James Mair, Chicago, Ill., assignors to Chicago Bridge & Iron Company, Oak Brook, Ill., a corporation of Illinois
Filed Jan. 8, 1964, Ser. No. 336,560
9 Claims. (Cl. 62—23)



1. The method of liquefying methane which comprises subjecting incoming methane gas to a substantially increased predetermined pressure, substantially lowering the temperature of the incoming methane by means of a closed-loop refrigeration system, further lowering the temperature of the so-cooled incoming methane gas by means of liquid methane removed from an insulated main storage tank for liquid methane to further reduce the temperature of the incoming methane, expanding the gaseous methane to liquefy and then flashing the resulting liquefied methane into the main storage tank to further lower the temperature of the liquid methane for storage at a temperature at which the gas gives a vapor pressure close to but slightly above atmospheric pressure.

3,271,966
CRYOSTATS
Frederick John Webb, Chilton, Berkshire, England, assignor, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission
Filed Sept. 2, 1964, Ser. No. 394,092
Claims priority, application Great Britain, Feb. 24, 1964, 7,655/64
5 Claims. (Cl. 62—45)

3. A cryostat comprising a vessel adapted to contain a liquid refrigerant having a boiling point below the ambient temperature of said vessel and a first upper liquid level in said vessel, means forming a hemispherical roof surface dome in said vessel under which said refrigerant has a second liquid level from which gas evolves to raise the first upper liquid level of said refrigerant in said cryostat, means communicating from said ambient to under said dome for venting said gas from beneath said dome to reduce the first upper liquid level of said refrigerant in said cryostat, and means controlling the venting of said gas in response to the raising of said first upper liquid level for restoring said refrigerant to a predetermined first upper liquid level in said cryostat.

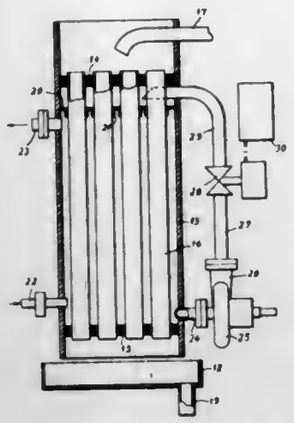


3,271,967
FLUID HANDLING
Joseph T. Karbosky, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed Feb. 19, 1965, Ser. No. 433,906
9 Claims. (Cl. 62—51)

1. A method for cooling a liquid comprising providing a source of refrigerant under an elevated pressure, passing said refrigerant into a first heat exchange zone in which said refrigerant is maintained at a lower pressure than said refrigerant source to lower the boiling temperature and therefore the temperature of the refrigerant in said zone, passing said liquid in heat exchange relationship with said refrigerant in said first heat exchange zone to cool same, removing liquid refrigerant from said first heat exchange zone and passing same into a second heat exchange zone in which said refrigerant is

maintained at a lower pressure than the pressure on said refrigerant in said first heat exchange zone to further lower the boiling temperature and therefore the temperature of same in said zone, removing said liquid from said first heat exchange zone and passing same in a heat exchange relationship with said refrigerant in said second heat exchange zone to further cool said liquid, removing said liquid from said second heat exchange zone, removing refrigerant vapors from said second heat exchange zone and compressing same substantially to the pressure maintained in said first heat exchange zone, combining said compressed vapors from said second heat exchange zone with refrigerant vapors from said first heat exchange zone, compressing said combined vapors and cooling same to form at least in part a refrigerant liquid at a temperature and a pressure substantially the same as that of said source of refrigerant under elevated pressure, and introducing said compressed and cooled combined refrigerant vapors into said source.

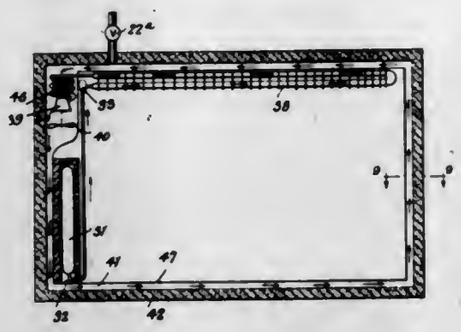
3,271,968
METHODS AND APPARATUS FOR COOLING MILK FOR USE WITH MILKING MACHINES
Günther Karnath, Eschenhahn, Taunus, Germany, assignor of twenty-five percent to Dipl.-Ing. Dr. Kurt Karnath, Wiesbaden, Germany, and fifty percent to Max Henry Hoepli, New York, N.Y.
Filed May 28, 1965, Ser. No. 459,570
Claims priority, application Germany, June 3, 1964, K 53,115; Mar. 23, 1965, K 55,615; Apr. 21, 1965, K 55,865
5 Claims. (Cl. 62—59)



1. A method of economically pre-cooling milk intermittently pumped from a milking machine to a collection point and arriving in spurts comprising, operating a refrigeration unit substantially constantly; exposing the cooling coils of said refrigeration unit to circulating water whereby a layer of ice will build up on the cooling coils to store coldness; intermittently passing milk in spurts through a filter to a collection chamber; withdrawing milk in a smooth stream from said chamber, passing the milk exteriorly of a heat exchanger, and cooling said smoothly flowing milk by passing said circulating water interiorly of said heat exchanger whereby the ice coating on said refrigeration coils will thin and supply coldness from storage evenly to said milk during intermittent milk pumping.

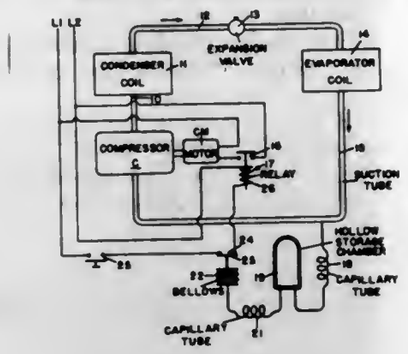
3,271,969
METHOD FOR FILM EVAPORATION AND AN EVAPORATOR FOR USING THE METHOD
Jørgen Lorentzen, Alfred Christensensvej 10, Naerum, Denmark
Filed Apr. 17, 1964, Ser. No. 360,565
Claims priority, application Denmark, Apr. 17, 1963, 1,777
5 Claims. (Cl. 62—98)

1. In a method for liquid film evaporation wherein cooling liquid is directed through automatic pulsating valve means to an evaporator surface, the steps of:



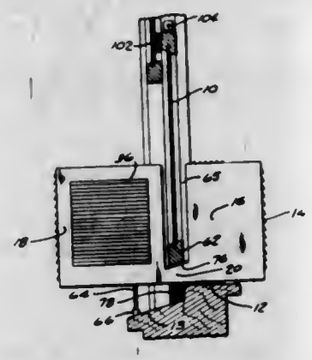
(a) directing a flow of said liquid through said automatic pulsating valve means to said evaporator surface to wet the same;

(b) discontinuing the flow of said liquid through said automatic pulsating valve means to said evaporator surface for a short preselected period of time;



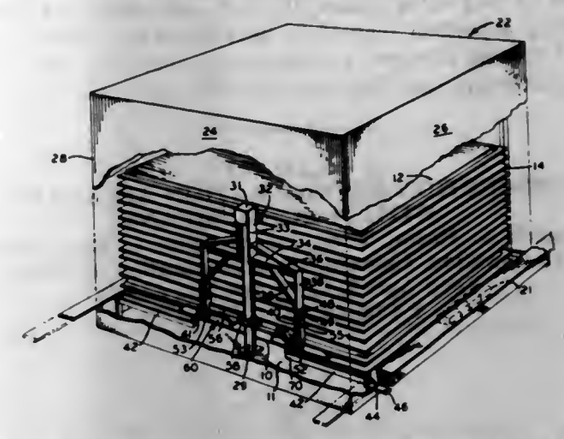
(c) recommencing directing a flow of said liquid through said automatic pulsating valve means to said evaporator surface while at least a portion thereof is still wet whereby the cooling effect of said fluid on said surface is increased relative to the cooling effect of a continuous flow of said fluid.

3,271,970
INSULATED COLD STORAGE ROOMS OR SIMILAR ENCLOSURES
Erling Berner, New Castle, Pa., assignor to Pennsylvania WMB, Inc., New Castle, Pa., a corporation of Pennsylvania
Filed Oct. 29, 1962, Ser. No. 233,841
13 Claims. (Cl. 62—223)



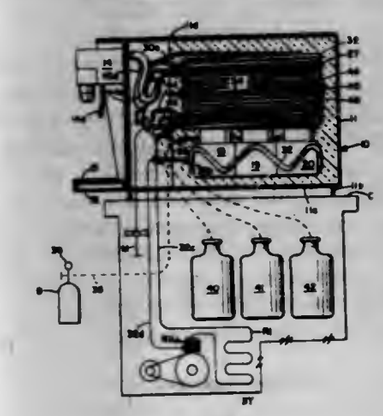
1. In cold storage apparatus of the character described with the interior thereof refrigerated by heat transfer contact with a cold gas and having spaced apart inner and outer walls with heat-insulating material disposed therebetween, said inner walls having higher heat transferability than said insulating material, the combination which comprises a source of said cold gas, gas-circulating grooves in the inner surface of said insulating material forming a network of gas-circulating passages extending throughout substantially the entire wall area of said apparatus between said inner walls and said insulating material, means for introducing and circulating at least a portion of said cold gas through said grooves and around the outside of said inner walls and in heat-transfer contact with both said inner walls and said insulating material effecting both cooling of the interior of said cold storage apparatus and removal of moisture from said insulating material, said cold gas being maintained at superatmospheric pressure in said grooves for minimizing leakage of moisture into said insulating material from outside said apparatus, and means for exhausting said gas from said grooves to the atmosphere.

3,271,971
LOW PRESSURE CUT-OUTS FOR REFRIGERANT COMPRESSORS
Erik H. Jensen and Alan L. Rhodes, Staunton, Va., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Dec. 31, 1964, Ser. No. 422,732
7 Claims. (Cl. 62—228)



1. A low pressure cut-out for a refrigerant compressor having a suction tube connected to its suction side, comprising a hollow storage chamber, means for connecting the interior of said tube to the interior of said chamber, pressure responsive means, means connecting the interior of said chamber to said pressure responsive means, and an electric switch operated by said pressure responsive means when the pressure within said chamber decreases to a predetermined pressure.

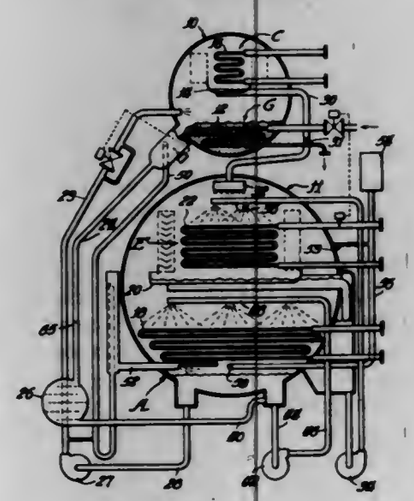
3,271,972
WINDOW AIR CONDITIONING UNIT
Verne C. Knight, Addison, Mich., assignor, by mesne assignments, to Addison Products Company, a corporation of Michigan
Filed Oct. 21, 1964, Ser. No. 405,518
6 Claims. (Cl. 62—262)



1. In the combination with apparatus for cooling and ventilating living space of the type having a pair of heat-exchanger sections disposable on opposite sides of a wall opening with said sections being separated from each other throughout the major portion of their vertical projections and having a connector section common to said sections of shallow vertical projections, the wall opening having closure means disposable between said heat-exchanger sections and overlying said connector section, of sound and weatherproofing means for the wall opening being disposed in a vertical plane thereof and being located on opposite sides of said connector section and approximating in vertical projections the clearance between the wall opening and the closure means, said sound and weatherproofing means having a ventilating opening therein.

3,271,973
AUTOMATIC CONTACT PLATE FREEZERS
Pasquale Amerio, Erskine Lakes, and Reynold E. Minnich, Martinsville, N.J., assignors to Amerio Refrigerating Equipment Co., Inc., Union City, N.J., a corporation of New Jersey
Filed Sept. 18, 1964, Ser. No. 397,990
5 Claims. (Cl. 62—341)

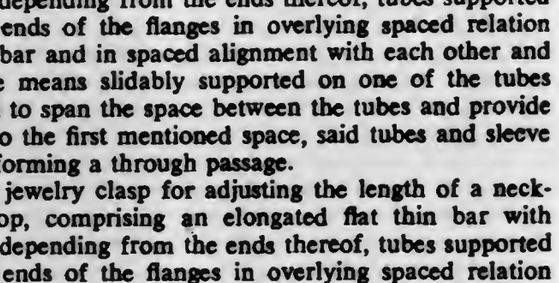
1. An automatic freezing apparatus comprising, in combination, a stack of superimposed contact freezer plates with minimum spacing means there between to provide freezing cavities, means for supporting the lowermost plate of the stack in fixed relation, means for successively raising each plate above the lowermost plate to increase the depth of the cavity to allow charging of boxes of unfrozen foods into the cavity, said raising of each plate causing the raising of all plates located above said plate, said means comprising catch arms which underlie the upper plate in each pair forming a cavity, frames pivotally supporting said catch arms on two opposed sides of the stack, front and rear conveyors for delivering said boxes to each cavity to permit loading of the cavities at a plurality of levels, and automatic means for moving the frames vertically in stepped increments to position the catch arms at the respective cavities.



3,271,974
CARBONATING AND DISPENSING APPARATUS
Clarence W. Wheeler, 1767 41st St. S., St. Petersburg, Fla.
Filed Oct. 16, 1964, Ser. No. 404,411
1 Claim. (Cl. 62—395)

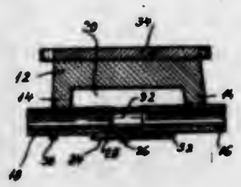
In a carbonated beverage dispensing apparatus, a housing, a water carbonating structure in said housing and comprising a vertically extending dome enclosing a water dispersing bed and a water collecting tank beneath said dome and forming a closure therewith, conduit means for discharging CO_2 gas into said bed, conduit means for discharging water into the top of said dispersion bed and including a coil of tubing in said housing and surrounding said dome, a cooling element comprising a coil

of tubing extending in heat exchange relation with the walls of said tank and in heat exchange relation with the first mentioned coil throughout the length thereof for chilling water supplied to said bed structure, a dispensing valve means supported by said housing, a water conducting tube interconnecting said tank of said carbonating structure and said dispenser, tube means for supplying extract to said valve means, the last mentioned tube means having a portion thereof in heat exchange relation with said cooling element, and insulation means in said housing enclosing said coils and carbonating structure.



3,271,975
ABSORPTION REFRIGERATION APPARATUS WITH PURGING MEANS
Leonard A. Rezin, York, Pa., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Filed Apr. 5, 1965, Ser. No. 445,487
8 Claims. (Cl. 62—475)

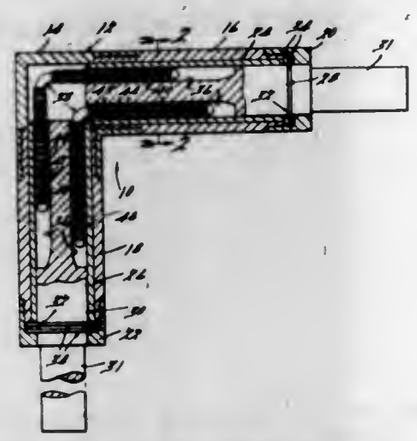
1. Absorption refrigeration apparatus comprising a generator, a condenser, an evaporator, and an absorber connected to provide a closed, continuous cycle refrigeration circuit; means for transferring relatively dilute absorber solution from the absorber to the generator; means for transferring relatively concentrated absorber solution from the generator to the absorber, said means including a substantially vertical conduit interconnecting said generator and said absorber, said generator and absorber being arranged such that solution flows by gravity in open-sewer fashion from the generator to the absorber; a purge unit interconnected with said refrigeration circuit for removing non-condensible gases from said circuit; and means associated with said conduit for venting non-condensible gases therein to said generator, said means including an elongated tube disposed internally of said conduit, said tube extending through a substantial portion of said conduit whereby any non-condensible gases whose upward flow through said conduit is impeded by the solution flowing downwardly therethrough can be effectively removed for subsequent elimination by said purge unit.



3,271,976
ABSORPTION REFRIGERATION
Everett P. Palmatier, Solvay, N.Y., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed June 1, 1965, Ser. No. 460,329
6 Claims. (Cl. 62—487)

1. An absorption refrigeration system comprising:
(A) an absorber for absorbing refrigerant vapor;
(B) an evaporator for evaporating refrigerant and providing a cooling effect;
(C) a generator for concentrating weak absorbent solution by vaporizing refrigerant therefrom;
(D) a condenser for condensing refrigerant vaporized in said generator; and
(E) a pump for passing absorbent solution in said system, said pump comprising:
(1) a pump housing containing a piston adapted to reciprocate within a cylinder to pump said weak solution;
(2) a power shaft extending through said housing and mounted thereon for oscillating motion;

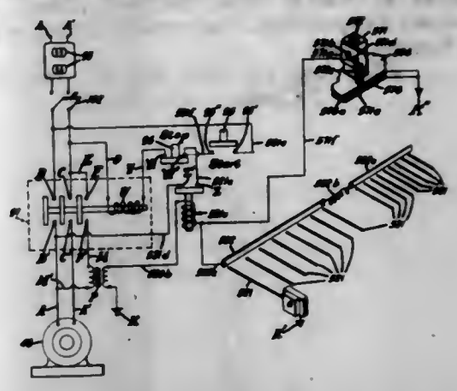
(3) driving means for imparting oscillating motion to said power shaft about the axis thereof;
(4) linkage means within said pump housing connecting said piston with said power shaft for imparting reciprocating motion to said piston from the oscillation of said power shaft; and
(5) seal means for securing said power shaft in liquid-tight engagement to said housing while permitting oscillation of said shaft, said seal means comprising an elastomeric seal bushing, said seal bushing being clamped in liquid-tight engagement with said pump housing and said shaft so that oscillation of said shaft is accommodated by a twisting movement of said seal bushing.



3,271,977
JEWELRY SHORTENER LOCK WITH PIN
Ernst Bohlinger, 31—15 25th Ave., Astoria, Long Island, N.Y., and Samuel Friedman, 556 Ave. Z, Brooklyn, N.Y.
Filed Nov. 12, 1963, Ser. No. 322,914
8 Claims. (Cl. 63—1)

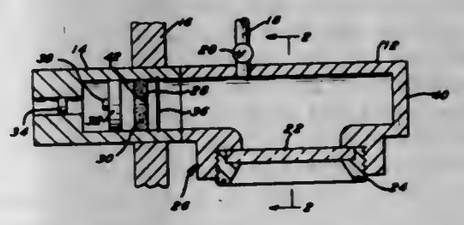
1. A jewelry clasp for adjusting the length of a necklace loop, comprising an elongated flat thin bar with flanges depending from the ends thereof, tubes supported on the ends of the flanges in overlying spaced relation to said bar and in spaced alignment with each other and a sleeve means slidably supported on one of the tubes adapted to span the space between the tubes and provide access to the first mentioned space, said tubes and sleeve means forming a through passage.

7. A jewelry clasp for adjusting the length of a necklace loop, comprising an elongated flat thin bar with flanges depending from the ends thereof, tubes supported on the ends of the flanges in overlying spaced relation to said bar and in spaced alignment with each other and a sleeve means slidably supported on one of the tubes adapted to span the space between the tubes and provide access to the first mentioned space, an ornamental oval-shaped plate fixed on the top edge of the bar disposed perpendicular to the plane of the body of the bar, said plate overlapping both sides of the body of the bar, said plate having its outer surface decorated with radial lines and having its peripheral edge corrugated, and a brooch having an elongated pin detachably extending through the aligned tubes and sleeve means, and means carried by the brooch for latching the brooch onto the protruding end of the pin, said plate adapted to seat on one side of a necklace and said brooch on the other side of the necklace.



3,271,978
ANGULAR ROTARY DRIVE UNIT
Albert J. Berna, 18690 Lauder, Detroit, Mich.
Filed Oct. 18, 1963, Ser. No. 317,353
10 Claims. (Cl. 64—20)

1. A device for the transmission of rotary power including a housing having a central hollow interior and a pair of angularly disposed cylindrical bearing surfaces defining rotor chambers, a pair of rotors supported one in each of said chambers, each of said rotors having a plurality of circumferentially spaced axially extending peripheral slots, a plurality of connecting rods each having a pair of cylindrical portions disposed in fixed angular relation corresponding to the angular relation of said bearing surfaces, one cylindrical portion of each of said rods being disposed in one of said axially extending slots on one of said rotors and the other cylindrical portion of each of said rods being disposed in one of said axially extending slots on the other of said rotors, bearing means comprising a plurality of axially spaced annular bearing elements extending inwardly from the inner periphery of each of said slots on said rotors and adapted to be interposed between said inner periphery of said slots and said cylindrical portions of said connecting rods, said cylindrical portions being engageable with the adjacent of said bearing surfaces, said bearing elements defining lubricant chambers therebetween adapted to supply lubricant to said slots and to said rotor chambers in providing for frictionless reciprocal movement between said connecting rods and said rotors and for frictionless rotary movement between said rotors and said rotor chambers.

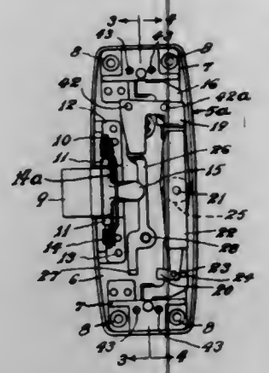


3,271,979
YARN CONTROL FOR KNITTING MACHINES
Benjamin Franklin Colle, Athens, Ga., assignor to Textile Machine Works, Wyomissing, Pa., a corporation of Pennsylvania
Original application Jan. 6, 1953, Ser. No. 329,801, now Patent No. 3,136,145, dated July 9, 1964. Divided and this application Mar. 16, 1964, Ser. No. 352,090
11 Claims. (Cl. 66—140)

2. In a knitting machine having knitting instrumentalities, means for driving said knitting machine; means for feeding yarn to, and withdrawing yarn from, said knitting instrumentalities; means for severing a yarn taken out of action; and means for automatically interrupting

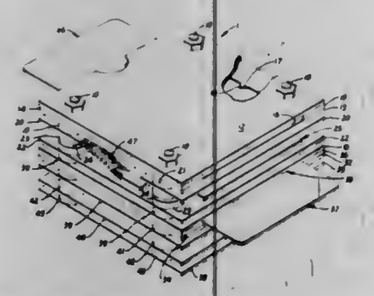
said driving means in the event that the yarn taken out of action is not severed by said yarn severing means.

3,271,980
CHEMICAL ENERGY LASER PUMP
Charles A. Boyd, West Chester, Pa., assignor to Aeroprojects Incorporated, West Chester, Pa., a corporation of Pennsylvania
Filed Mar. 16, 1964, Ser. No. 352,247
9 Claims. (Cl. 67—33)



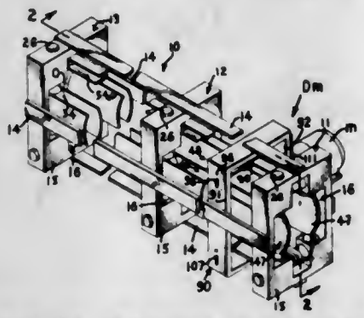
3. Apparatus for producing high intensity light pulse comprising a chamber, means for introducing an oxidizer into said chamber, means for dispersing and mixing the finely divided metal particles with said oxidizer, and means to subsequently generate a shock wave in said chamber after said metal particles have been dispersed and mixed with said oxidizer, whereby said metal particles chemically react with said oxidizer to produce a high intensity pulse of light.

3,271,981
COLLAPSIBLE DRYING FRAME FOR ANIMAL PELTS
Louis T. Hein, 3515 4 Mile Road, Racine, Wis.
Filed Oct. 28, 1964, Ser. No. 407,131
1 Claim. (Cl. 69—19.3)



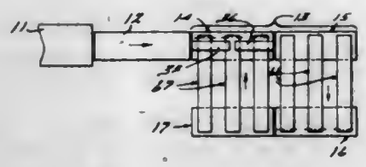
A pelt-drying frame having a pair of longitudinal legs lying in a common plane and spaced part, a nose-piece located between and at the lower extremities of said legs, and extending beyond the ends thereof, means connecting said legs to said nose-piece, said nose-piece having a portion thereof adjacent said connecting means in the plane of said legs and terminating in an end portion the mid-plane of said end portion being obliquely disposed relative to the plane of the first portion of said nose-piece, said legs being formed of sheet material and having cross sections comprising rib portions having web portions diverging arcuately from said rib portions.

3,271,982
DOOR LOCK
Nicholas A. Welch, West Hartford, Conn., assignor to Emhart Corporation, Bloomfield, Conn., a corporation of Connecticut
Filed Aug. 14, 1964, Ser. No. 389,571
7 Claims. (Cl. 70—92)



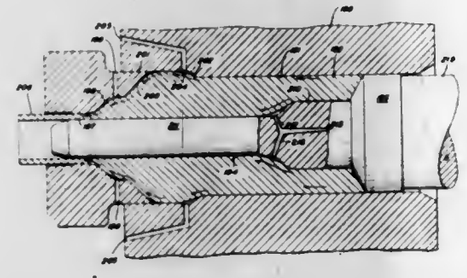
1. An emergency-exit lock including an active case comprising a base section, a latchbolt pivotally mounted on said base section and normally biased towards latching position outwardly of said section, said latchbolt having a tail thereon, a supporting cover on said base section, an operating lever pivotally mounted on a shaft on said cover a panic-bar secured to said operating lever, an operating finger pivotally mounted on said shaft and engageable with said tail on the latchbolt, an abutment between said operating lever and said operating finger for rocking said finger about said shaft to retract the latchbolt upon operation of said panic-bar, the said operating finger having an abutment thereon, a slidable member on said base, a rocker member carried by said slidable member and having a hook portion thereon, said rocker member being adjustable to locate the hook portion thereon in or out of register with the abutment on said operating finger, manually operable means for operating said slidable member to engage the hook portion on the rocker member with the abutment on the operating finger and thereby rock said operating finger to cause retraction of the latchbolt independently of the panic-bar, and separate means for adjusting said rocker member to render said manually operable means inoperable.

3,271,983
MAGNETIC LOCKING DEVICE AND METHOD OF COMBINATING THE SAME
Ernest L. Schlage, Burlingame, Calif., assignor to Schlage Lock Company, a corporation
Filed July 14, 1964, Ser. No. 382,548
33 Claims. (Cl. 70—276)



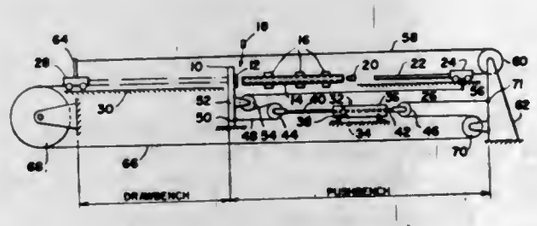
1. A magnetic lock comprising:
a frame,
a movable member of magnetizable material, means supporting said member for movement along an axis fixed relative to said frame between two extreme positions,
a generally planar slide supported for movement along a path of travel in the plane of said slide and at right angles to said axis,
interengaging elements on said member and slide respectively and adapted to coact to lock said slide against movement when said member is in one of said extreme positions, said interengaging elements being out of engagement to unlock said slide when said member is in the other of said extreme positions to permit movement of said slide.

3,271,984
METHOD AND APPARATUS FOR FORMING "F" OBLONG CAN BODIES
George M. Flynn, Chicago, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed Apr. 8, 1963, Ser. No. 271,252
35 Claims. (Cl. 72—210)



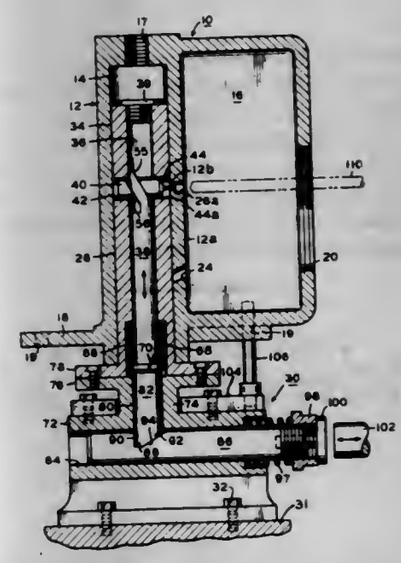
1. Apparatus for deforming substantially hollow cylindrical flexible metallic bodies into "F" style can bodies comprising a generally elongated support, means defining a predetermined path of travel for cylindrical bodies through said support, said path defining means including transport means for transporting cylindrical bodies interiorly of and through said support along said predetermined path, means for shaping the cylindrical bodies to a generally hour-glass transverse cross-sectional configuration without imparting a permanent set to the can bodies whereby the can bodies can rebound to a generally rectangular transverse cross-sectional configuration after departing said predetermined path, said predetermined path being a completely opened elongated area devoid of auxiliary forming mechanisms, and said shaping means comprising the sole means for shaping the cylindrical bodies to the hour-glass cross-sectional configuration thereof.

3,271,985
APPARATUS AND METHOD FOR STRAIGHTENING EXTRUDED BAR STOCK
Alexis N. Sokoloff and Floyd E. Clark, Port Huron, Mich., assignors to Mueller Brass Co., Port Huron, Mich., a corporation of Michigan
Filed Jan. 14, 1964, Ser. No. 337,637
11 Claims. (Cl. 72—256)



1. In a method for straightening bar stock, the steps of supporting the bar stock along its entire length against pressure directed in two perpendicular directions, exerting pressure simultaneously along the entire length of said stock in one of said directions, exerting pressure along the entire length of said stock in the other direction while the first-mentioned pressure is still being applied, removing the first-mentioned pressure while still applying the second-mentioned pressure, transporting said stock while still maintaining said second-mentioned pressure to a series of stations and then back to said first station, and removing said second-mentioned pressure when said stock reaches said first station.

3,271,986
EXTRUSION APPARATUS AND METHOD
Walter H. Stulen, North Caldwell, N.J., assignor to Baldwin-Lima-Hamilton Corporation, Philadelphia, Pa., a corporation of Delaware
Filed Dec. 9, 1964, Ser. No. 417,187
14 Claims. (Cl. 72—267)

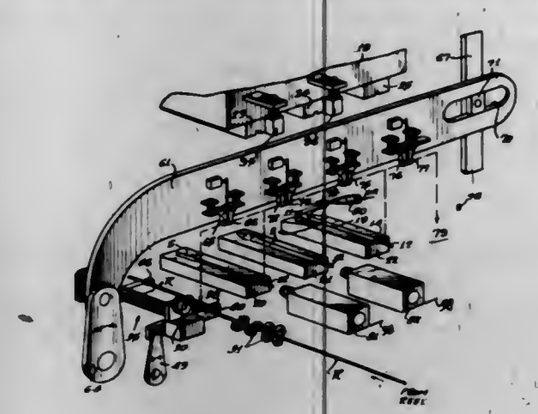


1. The method of extruding hollow metal shapes through a die having an extrusion orifice which comprises providing a metal billet, confining the billet, piercing the billet, subjecting the billet to forces applied in a direction to flow the metal of the billet through said extrusion orifice, rendering the inner periphery of the flowing metal free of laterally restrictive forces in a given zone in communication with said metal, providing a source of a flowable medium at a pressure substantially below and unrelated to the pressure of the flowing metal, and introducing said medium into said zone to form at least a surface layer of the flowing metal with said medium.

3,271,987
PRODUCTION OF LARGE DIAMETER THIN-WALLED TUBING
Delorma M. Douthett, Zelienople, Pa., and George A. Mitchell, Youngstown, Ohio, assignors to Halstead Metal Products, Inc., Zelienople, Pa., a corporation of Pennsylvania
Original application Oct. 1, 1963, Ser. No. 312,987. Divided and this application Nov. 30, 1965, Ser. No. 510,651
6 Claims. (Cl. 72—283)

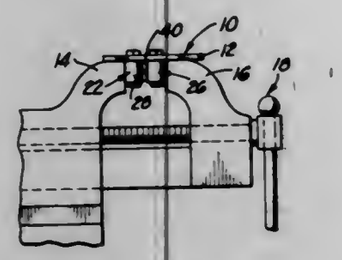
1. In apparatus for producing tubular shapes by expanding a tubular bloom followed by drawing the bloom, the combination of a drawing die, a draw carriage movable toward and away from the die on one side of the die, means for forcibly moving said drawn carriage away from said die, a push carriage movable toward and away from the die on the other side of the die in alignment with said draw carriage, means for positioning a tubular bloom to be expanded between the push carriage and the die when the push carriage is at a point removed from the die, an expanding plug adapted to be forced through said bloom, means for moving the push carriage toward the die whereby the push carriage will force said expanding plug into said bloom to effect an expanding operation on said bloom, and means for forcibly moving said draw carriage away from the die whereby the draw carriage effects a drawing operation on the bloom after it has been initially expanded.

3,271,988
METHOD OF FORMING A HOLE IN THE WALL OF A HOLLOW WORKPIECE
Karl W. Klinksiek, Richmond Heights, Mo., assignor to Wagner Electric Corporation, St. Louis, Mo., a corporation of Delaware
Filed Apr. 24, 1963, Ser. No. 275,807
14 Claims. (Cl. 72—325)



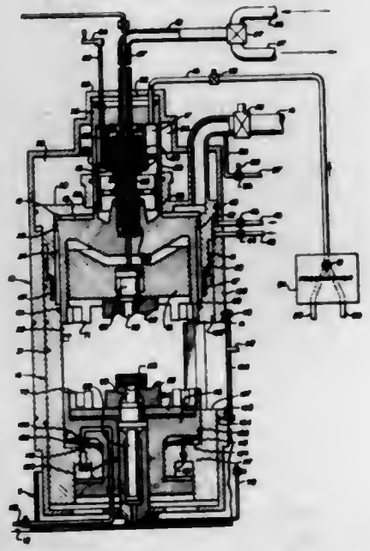
1. A method of forming a port hole through the metal wall of a cylinder having an outer surface, and an inner surface defining a bore comprising the steps of providing a recess in the wall of the cylinder which extends from the outer surface of the cylinder inwardly a predetermined distance toward the inner surface of the cylinder to provide a relatively thin wall section of substantially reduced thickness, and then punching said wall section with a punch from the bore side of the cylinder to provide an opening connecting with the recess.

3,271,989
METHOD OF AND APPARATUS FOR PRODUCING KITCHEN TOOL STALKS
Raymond E. Paddock, Prospect Heights, Ill., assignor to Ekco Products Company, Chicago, Ill., a corporation of Delaware
Filed Mar. 25, 1963, Ser. No. 267,481
18 Claims. (Cl. 72—356)



1. In the production of one-piece stalks for kitchen tools and the like from wire rod stock of substantially uniform circular cross-sectional contour, the process which comprises providing a length of wire stock defining a blank of sufficient length to produce a stalk having a toolward end portion, a handleward end portion and a shank portion joining said end portions at a selected distance apart, subjecting said toolward end portion and said

shank portion to pressure in an inner die cavity defined by opposed die members when said die members are in closed position so as to press said portions into a shape conforming to said inner cavity while allowing said handleward portion to occupy a position outside the confines of said die members, and simultaneously with said action upsetting the blank to form an enlargement at the junc-

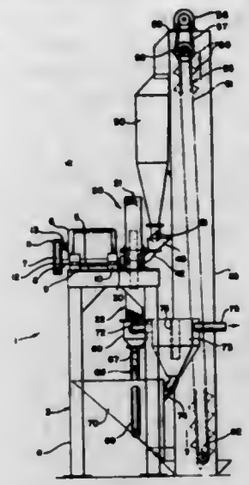


tion between said handleward portion and said shank portion lengthwise of the direction of pressure exerted by said die members by compressing said handleward portion toward said shank portion and forcing said enlargement into a front cavity in said die members joined to said inner cavity and facing the area occupied by said handleward portion of the blank, so as to shape said enlargement in conformity with said front cavity.

3,271,990
STRAP BENDING DEVICE
Duane E. Mitchell, Shandon Rte., Paso Robles, Calif.
Filed Sept. 16, 1963, Ser. No. 309,201
3 Claims. (Cl. 72—389)

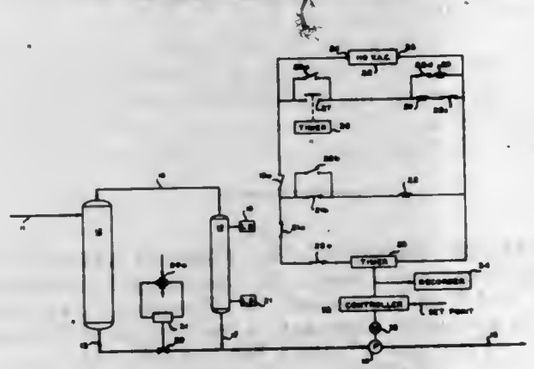
1. In a strap bending device for use in a vise, the combination of:
(a) a flat base having a lower surface seatable on the jaws of the vise;
(b) two spaced primary dies depending below said lower surface of said base and adjustably mounted on said base for movement toward and away from each other along a primary die path extending therebetween;
(c) a secondary die depending below said lower surface of said base and movably mounted on said base for movement toward and away from said primary die path along a secondary die path perpendicular to said primary die path and lying between said primary dies;
(d) said primary dies being engageable with one side of a strap at spaced primary points and said secondary die being engageable with the other side of the strap at a secondary point between said primary points; and
(e) said primary dies being engageable by one jaw of the vise and said secondary die being engageable by the other jaw thereof to produce movement of said secondary die toward said primary die path, upon closing movement of said jaws, to bend said strap around said primary and secondary dies.

3,271,991
HIGH ENERGY IMPACT MACHINE
Frederick A. Monahan, Burbank, Calif., assignor to International Electronic Research Corp., Burbank, Calif., a corporation of California
Filed Oct. 11, 1965, Ser. No. 494,781
18 Claims. (Cl. 72—453)



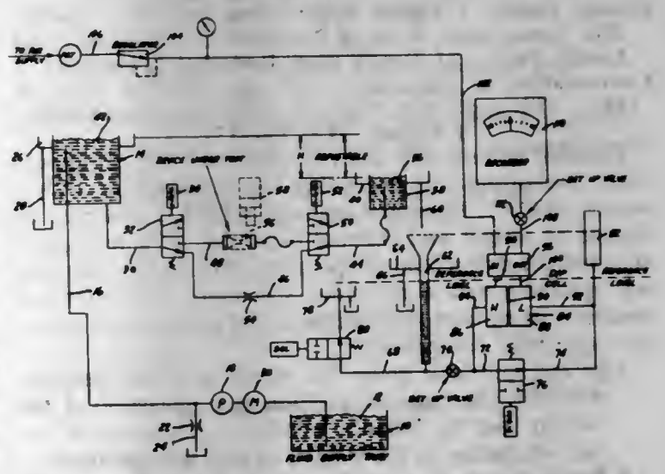
1. In a high velocity impact press for exerting controlled forces on a work piece, the combination of: a frame, a hammer supported upon said frame for axial slidable movement, said hammer including a platen supporting section and an auxiliary section movable relative to each other, said platen supporting section having axially spaced annular surfaces, an annular partition on said auxiliary section located between said surfaces, said partition having annular auxiliary surfaces defining a hydraulic pocket adjacent a platen carrying part of said platen supporting section and a pneumatic pocket on the opposite side of said partition, an annular ring in said pneumatic pocket dividing said pneumatic pocket into a hydraulic side and a pneumatic side, a plurality of circumferentially spaced bores through said partition between said pneumatic side and said hydraulic pocket and pins slidably mounted respectively in said bores having one end of each exposed to said hydraulic pocket and the other end of each in engagement with said annular ring, said pockets being productive of a squeeze force on said platen supporting section subsequent to impact.

3,271,992
METAL SHOT PRODUCING APPARATUS
Orald L. Stewart, Lakewood, Ohio, assignor to The Cleveland Metal Abrasive Co., Cleveland, Ohio, a corporation of Ohio
Filed Oct. 29, 1964, Ser. No. 407,432
5 Claims. (Cl. 72—476)



1. A machine for converting and deforming metal grit to shot comprising:
frame means,
horizontal shaft means mounted on said frame means,
driving means connected to said shaft means,

elongated blade means rigidly mounted to extend radially about said shaft means,
enclosure means substantially surrounding said blade means,
elongated target means of nonuniform thickness mounted within said enclosure means substantially to surround said blade means with the thickest portions of said target means located at points on the inside



of said enclosure means relatively near to the path of said blade means,
feed means in communication with the innermost ends of said blade means, and
collection means in communication with said enclosure means at a point on the inside of said enclosure means relatively far from the path of said blade means and below said shaft means.

3,271,993
ACCURATE FLOW CONTROL
Bobbie L. Whitson, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed Dec. 9, 1963, Ser. No. 328,911
3 Claims. (Cl. 73—3)

1. Apparatus for calibrating a flow controller comprising in combination a storage tank; a conduit connected to a lower portion of said storage tank for passing liquid from said storage tank; a flow controller operatively positioned in said conduit; a valve operatively positioned in said conduit upstream of said flow controller; a calibration tank, an upper liquid level sensor and a lower liquid level sensor operatively positioned on said calibration tank in a vertically spaced apart relationship; means for connecting the lower portion of said calibration tank to said conduit at a point upstream of said flow controller and downstream of said valve in such a manner that said calibration tank is at least partially filled with liquid to a point above said upper liquid level sensor when said valve is opened and liquid drains from said calibration tank into said conduit when said valve is closed; a voltage source having first and second terminals; first, second and third switches and a timer connected in series between said first and second terminals; a fourth switch and a relay coil connected in series between said second terminal and the junction between said first and second switches; a fifth switch connected in parallel with said fourth switch; a sixth switch, a second relay coil and a seventh switch connected in series between said first and second terminals; an eighth switch connected in parallel with said sixth switch; a ninth switch and a third relay coil connected in series between said second terminal and the junction between said sixth switch and said second relay coil; said first switch being actuated by said upper liquid level sensor to an open position when the liquid level in said calibration tank is above said upper liquid level sensor and to a closed position when the liquid level in said calibration tank is below said upper liquid level sensor; said second switch being actuated by said lower liquid level sensor to a closed position when the liquid level in said calibration tank is above said lower liquid level sensor and to an open position when the liquid level is below said lower liquid level sensor; said fourth switch being actuated by said lower liquid level sensor to an open position when the liquid level in said calibration tank is above said lower liquid level sensor and to a closed position when said liquid level is below said lower liquid level sensor; said third, seventh and ninth switches being normally closed switches which are actuated to open positions upon the passage of current through said first relay coil; said fifth switch being a normally open switch which is actuated to a closed position upon the passage of current through said first relay coil; said eighth switch being a normally open switch which is actuated to a closed position upon the passage of current through said second relay coil; and means for actuating said valve to a closed position responsive to the passage of current through said third relay coil; the output of said timer being representative of the time required for the liquid level in said calibration tank to drop from a first predetermined level as determined by said upper liquid level sensor to a second predetermined level as determined by said lower liquid level sensor during the time said valve is closed.

3,271,994
FLUID FLOW COMPARATOR FOR USE IN CALIBRATING FLUID FLOW ORIFICES
Daniel B. Fournier, Roseville, and Urho A. Strang, Livonia, Mich., assignors to Jered Industries, Inc., Birmingham, Mich., a corporation of Michigan
Filed Apr. 19, 1965, Ser. No. 449,060
9 Claims. (Cl. 73—3)

1. In a fluid flow measuring instrument for calibrating a fluid flow orifice, first and second fluid reservoirs, conduit structure interconnecting said reservoir, each reservoir containing liquid, the level of liquid in one reservoir

being lower than the liquid level of the other reservoir, means for supplying fluid to said other reservoir, said conduit structure being adapted to accommodate a test device in the form of an orifice, means for selectively establishing and interrupting flow of fluid from one reservoir to the other through said test device, means for collecting the liquid displaced by said one reservoir in a collector of variable depth, and means for recording the accumulated pressure head in said collector following a predetermined time interval, the magnitude of the pressure head accumulated during said interval thereby being a measure of the flow through said orifice.

3,271,995
MEASURING THE RADIAL FORCE EXERTED BY SHAFT SEALING RINGS
Hermann Bäumler, Burscheid, near Cologne, Germany, assignor to Goetzewerke Friedrich Goetze Aktiengesellschaft, Burscheid, near Cologne, Germany, a corporation of Germany
Filed Nov. 15, 1963, Ser. No. 324,068
Claims priority, application Germany, Nov. 20, 1962, G 36,444
6 Claims. (Cl. 73—9)

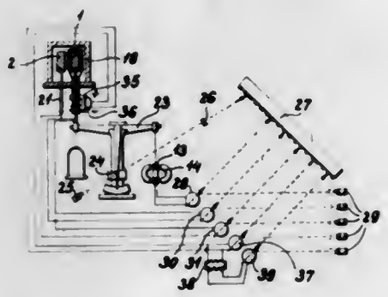
1. A device for measuring the radial force exerted by the sealing lip of an annular shaft sealing ring, comprising a holder for receiving a sealing ring which is to be tested, a measuring cone having a predetermined taper and adapted for insertion small end foremost into said sealing ring, support means supporting said holder with said sealing ring and said measuring cone in substantial axial alignment and operable to permit relative axial motion therebetween so as to allow said cone to be inserted into said sealing ring, and indicating means for indicating the axial force exerted by said sealing lip on and measuring cone when said cone is inserted into said sealing into said sealing ring a predetermined axial distance.

3,271,996
APPARATUS FOR THERMAL ANALYSIS
Ferenc Paulik, 7 Liptak Lajos utca, and Jenö Paulik, 57a Vecsey utca, both of Budapest IV, Hungary, and Laszló Erdey, 11 Fenyo utca, Budapest I, Hungary
Continuation of application Ser. No. 299,764, Aug. 5, 1963. This application Nov. 24, 1965, Ser. No. 513,649
1 Claim. (Cl. 73—15)

Thermal testing and analysis apparatus for simultaneously measuring and recording the temperature (TA), weight (TGA), thermal expansion (TDA), and rate of change of weight and thermal expansion of a test specimen and the differential temperature (DTA) between said test specimen and a reference specimen, said reference specimen being inert through the tested temperature range, said apparatus comprising

a balance movable under the weight of a test specimen whereby the balance position is a measure of the weight, and the balance velocity is a measure of the rate of change of the weight, of said test specimen;

a first supporting means for supporting said test specimen on said balance, said first supporting means comprising



two separate members movable with said balance and adapted to contact spaced portions of said test specimen, said members being slidably movable relative to each other whereby their relative position is a measure of the thermal expansion, and their relative velocity is a measure of the rate of change of thermal expansion, of said test specimen;

a second supporting means for supporting said reference specimen in close proximity with said test specimen, said second supporting means being mechanically independent of said balance;

means for simultaneously and equally heating both the test specimen and the reference specimen;

means for sensing and recording the temperature of said test specimen as a first trace on a record;

means for sensing and recording the differential temperature between said test specimen and said reference specimen as a second trace on said record coextensive with said first trace;

means for sensing and recording the balance position as a measure of the weight of said test specimen as a third trace on said record coextensive with said first and second traces;

means for sensing and recording the balance velocity as a measure of the rate of change of the weight of the test specimen as a fourth trace on said record coextensive with said first, second and third traces;

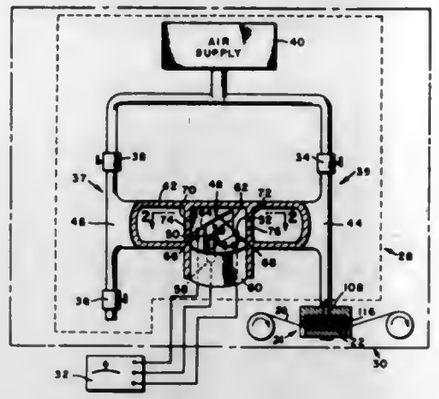
means for sensing and recording the relative position of said separate members as a measure of the thermal expansion of said test specimen as a fifth trace on said record coextensive with said first, second, third, and fourth traces; and

means for sensing and recording the relative velocity of said separate members as a measure of the rate of change of the thermal expansion of said test specimen as a sixth trace on said record coextensive with said first, second, third, fourth, and fifth traces.

3,271,997
PNEUMATIC DENIER MONITORING APPARATUS
Ronald Horne and Thomas W. McGlaughlin, Pensacola, Fla., and John L. Marshall, Jr., Flomaton, Ala., assignors to Monsanto Company, a corporation of Delaware
Filed Jan. 17, 1963, Ser. No. 252,143
8 Claims. (Cl. 73—37.7)

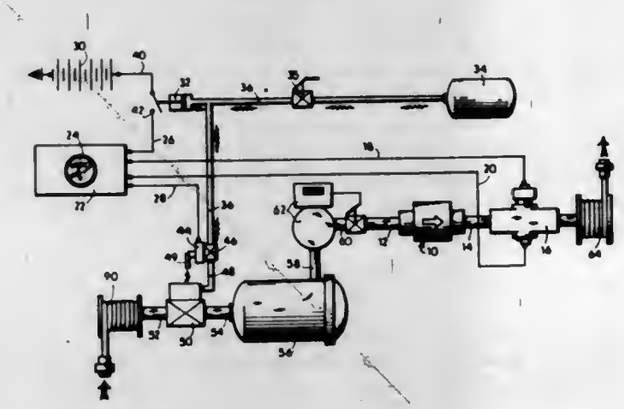
1. Apparatus for monitoring the denier of an elongated strand comprising in combination:

(a) a source of air at a pressure different from atmospheric,



(b) an airflow measuring device having an input side connected to said source and having an output side,

(c) and a monitoring head assembly, said head assembly comprising:



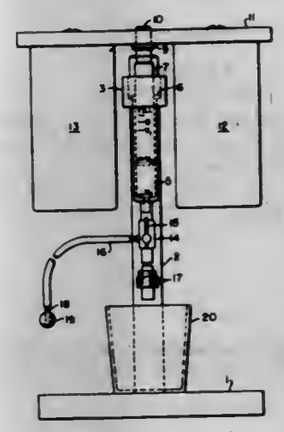
(1) means having a plurality of axially aligned grooves in a surface, said grooves being separated by transverse air passages vented to the atmosphere,

(2) a removable cover plate mating with said surface and spanning said grooves to form therewith a series of aligned restricted passageways for receiving said strand,

(3) and an air passage connecting an intermediate portion of each of said passageways with said output side whereby air flows from said flow monitoring device through said passageways in parallel.

3,271,998
DEVICE FOR IMPROVING DETECTION OF CONTAMINANTS
George J. Topol, Hamilton, Ontario, Canada, assignor to Bowser, Inc., Cookeville, Tenn., a corporation of Indiana
Filed May 6, 1963, Ser. No. 278,351
3 Claims. (Cl. 73—53)

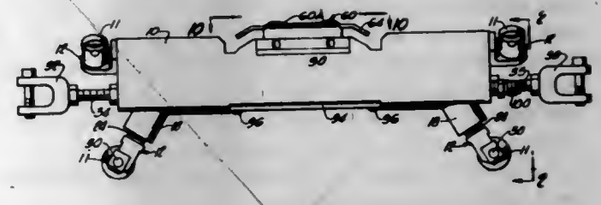
1. A device adapted to effect a substantially uniform dispersion of water in a system for testing for such contaminants, comprising:



(a) means having a plurality of individually formed openings which are spaced therein for conveying a quantity of fluid;

(b) fluid pressure-responsive piston-valve means having orifice control surfaces adapted to cover and uncover said openings which are constructed to provide a cumulative area defining the effective total orifice opening through which fluid is passed from said conveying means into said chamber;

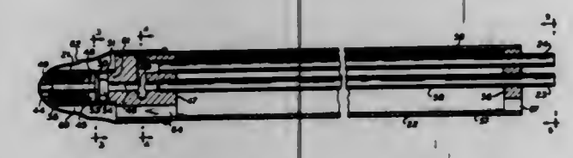
(c) means for biasing said fluid pressure-responsive means in a direction which tends to reduce the number of uncovered orifices, said pressure-responsive means being movable to increase the number of available orifice openings defining the effective orifice area to maintain a substantially constant pressure differential regardless of the degree of flow;



(d) and contaminant measuring means for receiving the flow of fluid after it has passed through said orifices to become substantially completely dispersed in said flow.

3,271,999
APPARATUS FOR DETERMINING THE SILTING PROPERTIES OF LIQUIDS CONTAINING MINUTE SUSPENDED PARTICLES
James L. Dwyer, South Lincoln, Mass., and Robert F. Connelly, Temple City, Calif., assignors to Millipore Filter Corporation, Bedford, Mass., a corporation of Massachusetts
Filed May 1, 1963, Ser. No. 277,234
7 Claims. (Cl. 73—61)

1. Apparatus for evaluating a liquid having particles therein to determine the silting properties, comprising a transparent measuring conduit of uniform cross-section for receiving the liquid having an outlet for the discharge of the liquid, a microporous filter of predetermined pore size mounted in the outlet to filter out particles having a size larger than the pores of the filter, means for applying a constant pressure to the liquid contained in the conduit to force it to flow through the filter, means for indicating the passage of successive volumes of the liquid forced to flow from the conduit and through the filter, consisting of index marks, one of said marks being the starting mark, the first mark being spaced from the starting mark to be substantially equivalent to the flow of clean liquid, the second and third marks being located so that the volume from the starting mark to the second mark is equal to the volume from the second mark to the third mark.



3,272,000
APPARATUS USEFUL IN ULTRASONIC INSPECTION OF PIPES
Larry O. Stebbins, Boulder, Colo., assignor to Automation Industries, Inc., El Segundo, Calif., a corporation of California
Filed May 9, 1963, Ser. No. 279,147
8 Claims. (Cl. 73—71.5)

8. Apparatus of the character described for the inspection of pipe wherein a transducer is mounted to trans-

mit energy pulses into the pipe and to receive echo signals therefrom, the combination of, an elongated body for traveling through said pipe, said body including mounting means to provide a support portion, means mounted on said body for being maintained in moving contact with the interior wall of the pipe when said body is inside said pipe, a transducer disposed in said support portion, a pipe-engaging member, means resiliently mounting said member on said body adjacent said interior wall of said pipe, said member being shaped to provide a window for the transducer, means mounting said transducer on said member for coupling said transducer to said window, and, water conduit means in said body communicating with said window for the flow of water through said window to couple said transducer to said interior wall.

3,272,001
TONOMETER
Herbert H. Adise, Great Neck, N.Y., assignor to Computer Instruments Corporation, Long Island, N.Y., a corporation of New York
Filed Dec. 16, 1963, Ser. No. 330,716
7 Claims. (Cl. 73—80)

5. A device for measuring the intraocular pressure of an eyeball comprising:

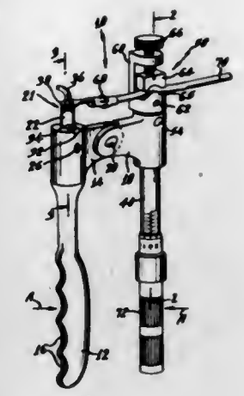
a probe having a wall for engaging the surface of said eyeball,

a chamber within said probe,

an axially movable plunger carried within said chamber and having one end extending through an aperture in said wall to the exterior, said plunger being movable between protrudent and retracted positions,

a source of air under pressure at a low supply rate,

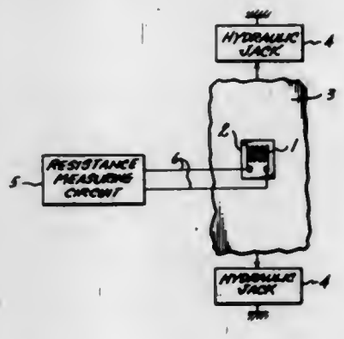
a fluid conduit means coupling said source with the interior of said chamber for introducing said air into said chamber for acting against said plunger to urge said plunger into said protrudent position with said one end protruding externally from said wall when the probe is out of contact with said eyeball,



at least one port in a wall of said chamber other than said first mentioned wall for venting said chamber when said plunger is in said protrudent position for maintaining the pressure of said air, at least within said chamber, at a level inadequate to prevent depression of said plunger into said retracted position when the wall of the probe is urged into contact with said eyeball,

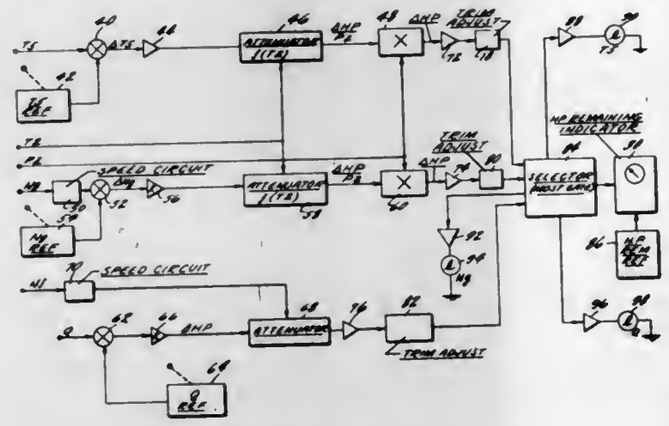
valve means carried by said plunger and operable upon said depression of said plunger to a predetermined position for isolating said port from said fluid conduit means whereby the air pressure within said chamber and acting upon said plunger is caused to rise continually until the resistance due to said intraocular pressure is overcome and the plunger is again urged toward said protrudent position, the said one end of said plunger being flush with the exterior surface of said first mentioned wall when said plunger occupies said predetermined position,

means for limiting said depression of said plunger at said predetermined position,



and pressure gauging means coupled to said conduit means adjacent said chamber for indicating the magnitude of said intraocular pressure.

3,272,002
TESTING TOOLS
Walter H. Dickman, 6 Darby Drive, Huntington Station, N.Y.
Filed Dec. 31, 1963, Ser. No. 334,729
9 Claims. (Cl. 73—88)



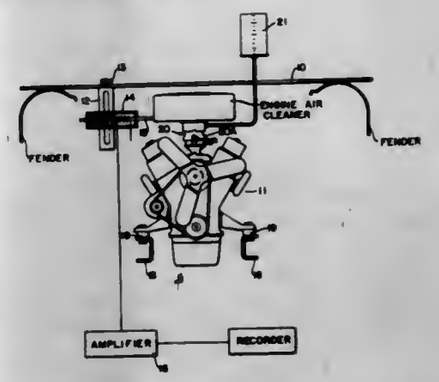
1. A device for testing a workpiece comprising a pair of relatively spaced engaging means movable relative to each other and adapted to engage a workpiece to apply a linear force thereto, means movable to cause said engaging means to move relative to each other, force transmitting means between said movable means and one of said engaging means to transmit the force of movement of said movable means undiminished directly to said one engaging means to cause the same to apply a linear force to the workpiece, said force transmitting means being operable to release the transmission of the force of movement of said movable means when the linear force applied to the workpiece exceeds a predetermined force and to provide an indication perceptible to the audible and tactile senses of the application to the workpiece of a force in excess of the predetermined force, said movable means being a manually actuatable handle mounted for pivoted movement, a frame on which said handle is pivotally mounted, and said other engaging means being mounted on said frame for linear movement relative thereto.

3,272,003
FATIGUE LIFE GAGING METHODS
Darrell R. Harting, Seattle, Wash., assignor to The Boeing Company, Seattle, Wash., a corporation of Delaware
Filed Jan. 27, 1964, Ser. No. 340,331
6 Claims. (Cl. 73—91)

1. The method of measuring the cumulative fatigue damage at an area on a structure which is subjected to repeated loading comprising the steps of mounting a grid of conductive material on the structure to be tested so that strains in the test structure are transmitted to the grid, subjecting the structure to repeated loading which causes a permanent and finite change in the electrical resistance of the grid, measuring the change in the resistance of the grid, and determining the fatigue life of the structure by comparing the change in resistance with fatigue life data on the grid material obtained under known conditions.

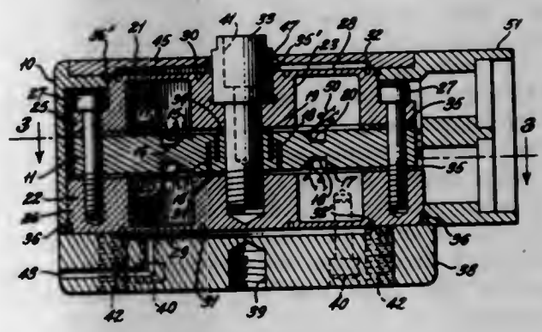
3,272,004
HORSEPOWER REMAINING COMPUTER
Ronald A. Haverl, Vernon, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Filed Sept. 3, 1963, Ser. No. 306,174
8 Claims. (Cl. 73—116)

1. In combination with a gas generator having means associated therewith for sensing the values of and producing signals proportional to tailpipe temperature, rotational speed of the gas generator and the pressure adjacent the inlet to the gas generator, a horsepower remaining computer comprising:



first means for multiplying the difference between the actual tailpipe temperature and the maximum permissible tailpipe temperature by the pressure adjacent the inlet to the gas generator to compute a first signal commensurate with horsepower remaining as a function of tailpipe temperature,

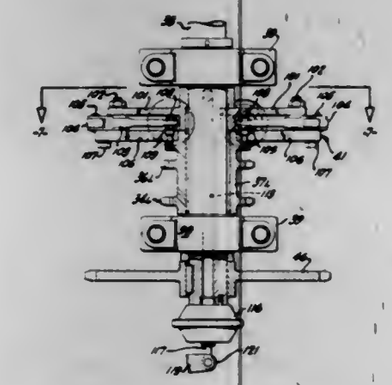
second means for multiplying the difference between the actual gas generator rotational speed and the maximum permissible speed of rotation by the pressure adjacent the inlet to the gas generator to compute a second signal commensurate with horsepower remaining as a function of rotational speed, and



means for comparing said first and second signals commensurate with horsepower remaining and for selecting for application to an indicator the one of said signals indicative of the least amount of actual horsepower remaining available from the gas generator.

3,272,005
ENGINE ROUGHNESS TESTER
Victor F. Massa, Berkeley Heights, N.J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Filed Jan. 25, 1965, Ser. No. 432,052
2 Claims. (Cl. 73—116)

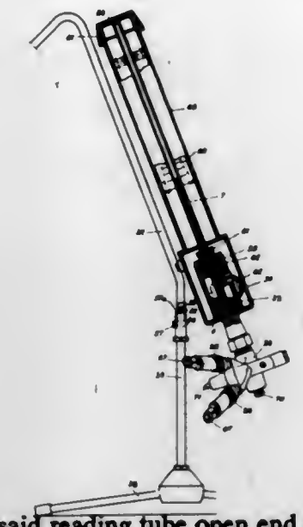
1. Apparatus for analyzing and diagnosing the mis-operation of an internal combustion engine of the piston-driven crankshaft type wherein said engine is subjected to periodic impulses generally about the crankshaft axis and wherein means are provided for mounting said engine to permit limited oscillatory freedom thereof about said axis to reflect said impulses; comprising in combination, means for sensing rotational oscillations of said engine upon its mounting means, support means for said sensing means, said support means including a generally horizontal bar arranged to be positioned above said engine and having an elongated slot therein, an arm, means for mounting one end of said arm in the slot of said bar and for adjusting the lateral position of said arm with respect to said bar, said sensing means being secured to said arm and including a plunger having one end thereof in contact with a portion of said engine radially displaced from said crankshaft axis, and means responsive to movement of said plunger for providing a permanent recording of the oscillatory movement of said engine about said crankshaft axis whereby a graph is produced for subsequent comparison and analysis in relationship to known predetermined graphic patterns associated with known types of engine mis-operation.



3,272,006
TENSION AND COMPRESSION LOAD-MEASURING DEVICE
Ronald G. Eckard, Cumberland, Md., assignor to Allegany Instrument Company, a division of Textron Electronics, Inc., Cumberland, Md., a corporation of Delaware
Filed July 25, 1963, Ser. No. 297,712
3 Claims. (Cl. 73—141)

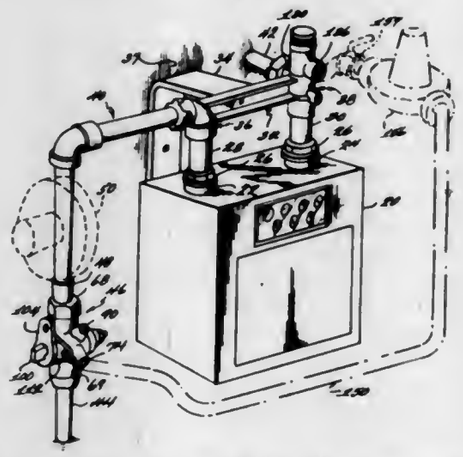
1. A force measuring device comprising a force sensing element formed in a plate member mounted transversely to the axis of the applied force and including strain sensing transducer means, said plate member being supported between a pair of load receiving members having centrally located load transmitting portions to transmit the applied force to said force sensing element, said load receiving members having rim portions joined to the periphery of said plate member and side walls on said load receiving members spaced from said plate member and extending between said load transmitting portions and said rim portions, a protective housing formed internally to receive said plate and load receiving members with a sliding fit, said plate and load receiving members being secured in said housing by welding, plate means secured to one side of said housing facing one of said load receiving members having means formed therein to secure said measuring device against reaction to the ap-

plied force, said plate means being hollowed out on the side facing said load receiving member to form a chamber therebetween, vent means formed in said plate means to vent said chamber, a second plate means mounted on the opposite side of said housing and being hollowed out to form a second chamber between said second plate means and the other of said load receiving members, said second plate having a centrally located aperture formed therein, and means to apply force to said device protruding freely through said aperture and connected to at least one of said load transmitting portions.



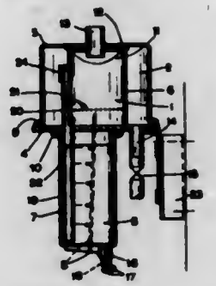
3,272,007
TENSION INDICATOR
Robert W. Goode, Morgan Hill, Calif., assignor, by direct and mesne assignments, of one-half to Gerald A. Petersen, Santa Clara, Calif., and one-half to Anita E. Petersen, Saratoga, Calif.
Original application Mar. 22, 1963, Ser. No. 267,168, now Patent No. 3,241,817. Divided and this application May 11, 1964, Ser. No. 366,374
5 Claims. (Cl. 73—143)

1. A tension indicator comprising a first rotatable means, a second rotatable means co-axial with said first means, brake means applying braking force to said first means, power means rotating said first means, a first arm fixed for rotation with said first means, a second arm fixed for rotation with said second means, a lever pivotally mounted on one said arm about a fulcrum, a fluid pressure cylinder on said last-mentioned arm and having a drive rod, means interconnecting said drive rod and said lever, means interconnecting the other said arm to said lever, motion of said drive rod relative to said cylinder being responsive to pressure in said cylinder resisting relative rotation of said arms, and indicating means indicating said pressure.



3,272,008
APPARATUS FOR TESTING PRESSURE IN PNEUMATIC TYRES
Pierre Lamperti, 20 Ave. Duval-Le Camus, Saint-Cloud (Seine et Oise), France
Filed Feb. 12, 1964, Ser. No. 344,305
7 Claims. (Cl. 73—146.3)

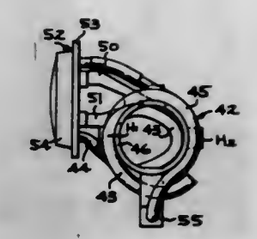
1. Gas pressure measuring apparatus comprising a frame, a housing pivotally mounted on said frame and operative to be disposed in a substantially horizontal position corresponding to a non-operative condition of said apparatus and to an upright position corresponding to an operative condition of said apparatus, a gas tight chamber partially filled with a liquid disposed in said housing, an inlet tube connected at one end to said chamber and being selectively connectable at the other end to the atmosphere and to a source of gas under pressure, a measuring tube closed at one end and open at the other end disposed in said housing, said measuring tube extending at its open end into said chamber, conduit means operative to selectively interconnect said inlet tube to a source of gas under pressure, said chamber having an amount of liquid therein such that when said housing is in a substantially horizontal non-operative position the level of said



liquid is below said reading tube open end and when said housing is in said operative position said reading tube open end is immersed in said liquid thereby causing said liquid to rise in said reading tube to a height corresponding to the gas pressure in said chamber.

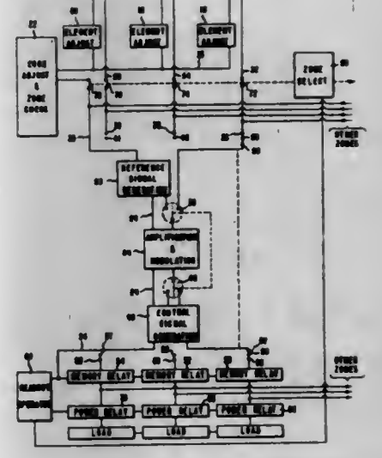
3,272,009
BY-PASS TYPE METER SETTING
Wilbur R. Leopold, Jr., and John J. Smith, Decatur, Ill., assignors to Mueller Co., Decatur, Ill., a corporation of Illinois
Filed Dec. 17, 1963, Ser. No. 331,213
12 Claims. (Cl. 73—201)

12. A by-pass type meter setting comprising: a fluid line; a fluid meter detachably connected into said line; a first valve connected into said line upstream of said meter and having two positions, an open position wherein flow takes place therethrough to said meter and a closed position wherein flow from the upstream side of said line to said meter is blocked; means spaced upstream from said valve including a by-pass port, a one way check valve in said by-pass port for preventing fluid from flowing from said by-pass port; a second valve connected to said line downstream of said meter and having a body provided with a by-pass port, said second valve having at least two positions, an open position wherein flow takes place therethrough from said meter and flow from said port is blocked and a by-pass position wherein flow takes place from said port to the downstream side of said line and flow from said meter is blocked; a by-pass line detachably connectable to and between said by-pass ports; and means carried by said by-pass line for positively opening said check valve independent of said first valve when the by-pass line is connected to the port carrying said check valve.



3,272,010
DEVICE FOR METERING MILK AND OTHER LIQUIDS
Noel G. Johnson, Hairini, near Te Awamutu, New Zealand
Filed Dec. 24, 1963, Ser. No. 333,051
Claims priority, application New Zealand, Jan. 17, 1963, 133,965
25 Claims. (Cl. 73—202)

1. A device for metering milk and other liquids comprising a composite container structure, including a primary chamber, a secondary chamber, and a metering chamber; a liquid inlet communicating with the primary chamber and through which liquid from outside the device can enter the primary chamber; a liquid outlet communicating with the secondary chamber and through which liquid within the secondary chamber can pass out of the device; liquid outlet means providing a communication between the primary chamber and the secondary chamber, whereby a major proportion of liquid introduced into the primary chamber may pass into the secondary chamber; and additional liquid outlet means providing a communication between the primary chamber and the metering chamber, whereby a minor proportion of liquid introduced into the primary chamber may pass into the metering chamber, the relative capacities of the said outlet means communicating with the secondary chamber and the said outlet means communicating with the metering chamber being substantially fixed, so that, when the device is in use, the outflow of liquid from the primary chamber to the secondary chamber represents a function of the outflow of liquid from the primary chamber to the metering chamber, said primary chamber and the secondary chamber being contained within an upper portion of the container structure, said metering chamber being contained within a lower portion of the said structure; said primary chamber being separated from the secondary chamber by a vertical cylindrical wall provided with a plurality of horizontally aligned apertures which constitute the said liquid outlet means providing a communication between the primary chamber and the secondary chamber.

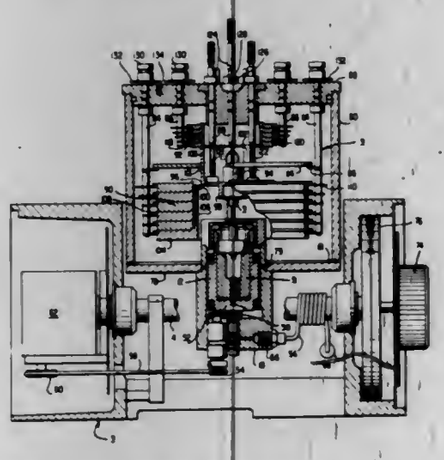


3,272,011
RESERVOIR EMPTY INDICATOR
Norman L. Kendt and John A. Dicken, Jr., Louisville, Ky., assignors to General Electric Company, a corporation of New York
Filed Apr. 23, 1964, Ser. No. 361,989
7 Claims. (Cl. 73—299)

1. An empty indicator for a liquid reservoir comprising:
(a) a gauge having a first end and a second end,
(b) a first tube extending from the lower portion of the reservoir to said first end of said gauge,
(c) a second tube extending upwardly from said second end of said gauge and being open to the atmosphere,
(d) said first tube having a helical portion and said second tube having a helical portion co-axial with said helical portion of said first tube,

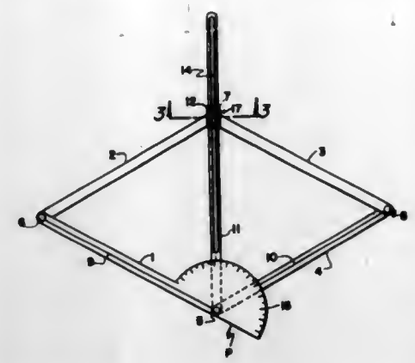
(e) said first tube having a high point and said second tube having a high point with said high points being at approximately the same level, and
(f) indicator fluid normally positioned in said first tube when the reservoir is substantially empty,
(g) said indicator fluid being moved into said gauge by pressure created within said first tube when the reservoir is filled with liquid.

3,272,012
HIGH SPEED SCANNING SYSTEM
John S. Seney, Seaford, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Sept. 9, 1959, Ser. No. 838,985
22 Claims. (Cl. 73—341)



20. A multi-point condition control system comprising: a plurality of electrical condition-controlling devices; a condition responsive, signal-forwarding sensing element associated with each condition; a circuit having components for generating a reference signal, chopping the reference signal with successive sensed signals, amplifying the chopped signals, separating the amplified signals and generating a control signal when a sensed signal differs from the reference signal; and a high speed scanning switch assembly for sequentially and substantially simultaneously coupling said circuit between said elements and their respective condition-controlling devices, said switch assembly being in cyclical synchronism with said chopping and separating components.

3,272,013
COMBINED RADIOMETER AND EMISSOMETER
Robert W. Astheimer, Westport, Conn., assignor to Barnes Engineering Company, Stamford, Conn., a corporation of Delaware
Filed Aug. 29, 1963, Ser. No. 305,918
11 Claims. (Cl. 73—355)

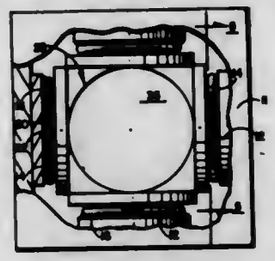


1. A radiometer comprising, in combination,
(a) a thermally insulated radiometer housing,
(b) a radiation detector,
(c) catoptric imaging means and a relatively minute opening in the housing, the maximum dimension of the catoptric means being more than 10 times the diameter of the opening and the imaging means imaging the minute opening onto the radiation detector,
(d) means for chopping the incoming radiation whereby chopped radiation from a very large angular field of view is imaged onto the detector.

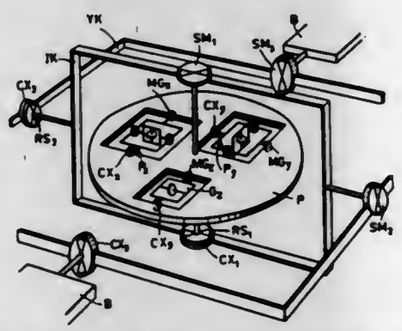
3,272,014
DEADWEIGHT GAUGE
Claude E. Miks, Lloyd H. Linton, and Gilbert Wilson, Houston, Tex., assignors to Ruska Instrument Corporation, Houston, Tex., a corporation of Texas
Filed Apr. 30, 1963, Ser. No. 276,733
5 Claims. (Cl. 73—419)

1. A deadweight gauge comprising,
a base,
a piston and cylinder supported on said base, said cylinder closed at one end,
support means on one of said cylinder and piston for supporting a plurality of weights,
means providing for relative rotation of said cylinder and piston,
means admitting pressure fluid to be measured to the closed end of said cylinder,
a container defining a pressure sealed chamber disposed about said piston and cylinder,
a plurality of weights within the container,
and weight support means controlled from the exterior of the container selectively supporting said weights on the container or on said support means.

3,272,015
ROTOR BALANCING DEVICE
Carl M. Behm, 27317 Santa Clara Drive, Westlake, Ohio
Filed Nov. 27, 1963, Ser. No. 326,586
8 Claims. (Cl. 73—470)



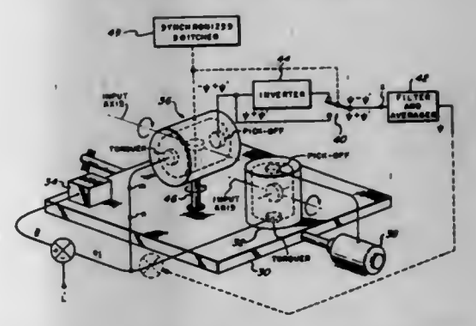
1. In a method of dynamically balancing a piece of rotating equipment in which a reference mark is arbitrarily placed on said equipment, a vibration pick-up analyzer is attached to the bearing housing of such equipment, a pair of equal counterweights W are placed 180° apart on said equipment, and the amplitude and phase of unbalance while in rotation are recorded on a vector diagram as O, the improvement wherein an articulated parallelogram having a scale pointer extending diagonally thereof with one end pivotally connected at one vertex of the parallelogram and the other end longitudinally slidable at the diagonally opposed vertex is used to determine various angles between such counterweights and to locate the midpoint therebetween, such method comprising:
(a) adjusting such counterweights to a position 120° apart, using the scale pointer of the articulated parallelogram to locate the midpoint between the counterweights, and marking said midpoint on said equipment,
(b) rotating said equipment and observing and recording the amplitude and phase of the new unbalance as R,
(c) completing the vector diagram, T, between O and R, and determining the amount of the balancing weight by the equation, $O/T \times \text{percent } W = \text{Balancing weight}$,
(d) using the articulated parallelogram to determine the angle at which the counterweights must be placed to equal the weight found in step (c) above, and
(e) determining the new location of the counterweight setting by measuring the angle and direction of O to T in the vector diagram, finding the point on the equipment in this direction and angle from the point found in step (a) above, and setting the pointer of the articulated parallelogram at the new location point and adjusting the articulated parallelogram to the angle found in step (d) above to determine the new location of the correction weights.



3,272,016
THREE-AXIS ACCELEROMETER
William D. Mullins, Jr., Downey, Calif., assignor to North American Aviation, Inc.
Filed Oct. 3, 1961, Ser. No. 142,641
2 Claims. (Cl. 73—517)

1. In a three-axis accelerometer, a case, a proof mass having a pair of opposite broad surfaces made of material which becomes superconductive at a cryogenic temperature, normal to each of three mutually orthogonal axes, said proof mass also having two pairs of disk-shaped sections, each said section being positioned at an extremity of said proof mass opposite its paired section along one of said axes, two pairs of said broad surfaces being formed

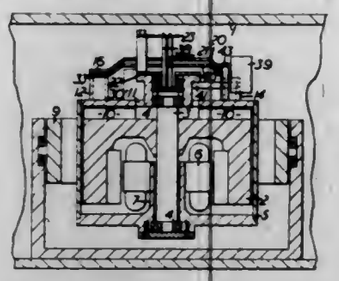
in said disk-shaped sections, said proof mass further having a recessed center structure, the third of said pairs of surfaces being formed in said center structure, three pairs of series connected support coils made of material which becomes superconductive at a cryogenic temperature, three pairs of pickoff plates, each of said support coils and said pickoff plates being attached to a separate wall of said case opposite one of said broad surfaces, each of said pairs of coils and said pairs of pickoff plates being positioned normal to a separate one of said axes, means for maintaining said case and its contents at a cryogenic temperature, means for developing a separate control current connected to each of said pairs of coils for maintaining said proof mass in a balanced position magnetically supported in said case, and A.-C. power source means connected to each of said pairs of pickoff plates, each said current developing means being operatively connected to an associated pair of said pickoff plates.



3,272,017
NAVIGATION APPARATUS
Nils Folke Hector, Solna, Sweden, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Dec. 18, 1961, Ser. No. 160,015
Claims priority, application Sweden, Dec. 21, 1960, 12,378/60
9 Claims. (Cl. 74—5.34)

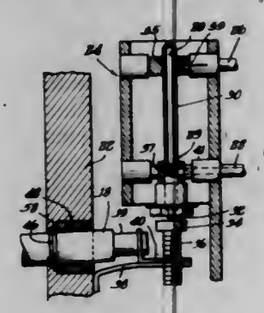
1. A true vertical indicating device comprising: a platform mounted in gimbals and supporting two pendulum means which are Schuler-tuned by gyroscopic means, the pendulum means having mutually perpendicular, horizontal rotation axes coincident with the sensing axes or input axes of the respective co-operating gyroscopic means, said platform being arranged to occupy a predetermined angular position relative to the pendulum means by means of servo motors and resolving means arranged at the supporting shafts for the platform and by means of angular sensing devices or signal generators arranged at shafts coincident with the pendulum axes, the gyroscopic means being arranged to sense the angular movements of the pendulum means relative to space-fixed reference directions and to co-act with means for producing signals which are proportional to the angular accelerations of the pendulum means, the gyroscopic means being arranged to precess as a result of rotation about respective input axes under suitable restraining of output shafts perpendicular to the input axes, and signal generators arranged at the output shafts for producing signals proportional to the angular velocities of shafts coincident with respective input axes, said signal generators being connected to respective torque generators through differentiating means, said torque generators feeding to the pendulum means counteracting torques proportional to the angular accelerations of the pendulum means with proportionality constants corresponding to Schuler-tuning.

3,272,018
MONITOR APPARATUS
Gordon J. Watt, Huntington Station, N.Y., assignor to Sperry Rand Corporation, Great Neck, N.Y., a corporation of Delaware
Filed Nov. 1, 1963, Ser. No. 321,392
20 Claims. (Cl. 74—5.34)



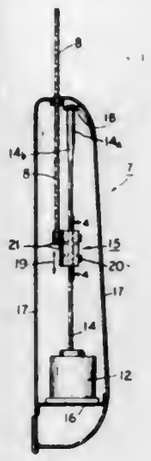
11. In a stable table reference system having a control gyroscope that provides output signals representative of the displacement between its sensitive element and its housing, said gyroscope being adapted to receive input signals which create torques about an output axis of said gyroscope, and a platform positionable in response to said output signals and so supporting said gyroscope housing that as the platform gets oriented precessional counter torques are applied to the gyroscope to cancel said output signals, a monitor gyroscope mounted on said platform and adapted to be rotatable about an axis perpendicular to the plane of said platform, said monitor gyroscope being adapted to receive and produce respective input and output signals like said control gyroscope, the input axis of said monitor gyroscope having a quiescent orientation parallel to the input axis of said control gyroscope, means producing table positioning signals, said positioning signals being applied to both said gyroscopes, whereby the table is positioned in response to the output signals from said control gyroscope, positioning of said table causing precessional counter torques about the output axis of said monitor gyroscope which operate to cancel the torques produced by said applied table positioning signals, means alternately reversing the direction of said monitor gyroscope input axis whereby the output signals from said monitor gyroscope become modulated and contain signal components representative of the drift errors of both said gyroscopes, and means filtering away the drift error signal component of the monitor gyroscope, whereby an error signal is provided for decreasing the table positioning signal adapted to be applied to said control gyroscope.

3,272,019
GYRO-VERTICAL APPARATUS
Jeffery Walton Barnes, Farnborough, England, assignor to Ferranti, Limited, Holliawood, Lancashire, England, a company of Great Britain and Northern Ireland
Filed Oct. 12, 1962, Ser. No. 230,040
Claims priority, application Great Britain, Oct. 14, 1961, 36,933/61
12 Claims. (Cl. 74—5.43)



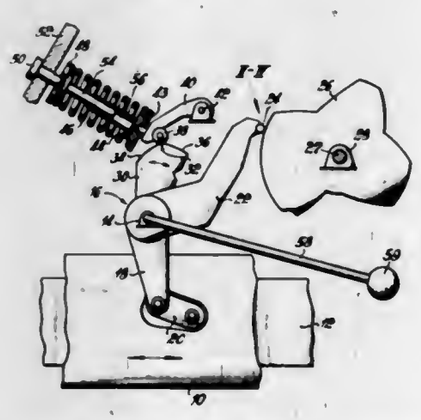
1. Gyro-vertical apparatus having pitch and roll axes including within a hermetically sealed gas filled housing an electrically driven rotor, first and second pairs of jets symmetrically disposed with respect to the spin axis of

said rotor and adapted to discharge in a direction parallel to said spin axis, said first pair of jets being disposed on a line at 45° to the pitch axis and said second pair of jets being disposed on a line at 45° to the roll axis, a centrifugal pump driven by said rotor for supplying gas to said first and second pairs of jets, and first and second sets of gravity controlled shutters responsive to move-



ments about the pitch and roll axes, respectively, each of said first and second sets of shutters being pivoted about an axis parallel to said spin axis and comprising four shutters adapted to so cooperate with said jets that the discharge from each jet is controlled by a shutter from said first set and a shutter from said second set to control erection of the gyroscope about the pitch and roll axes.

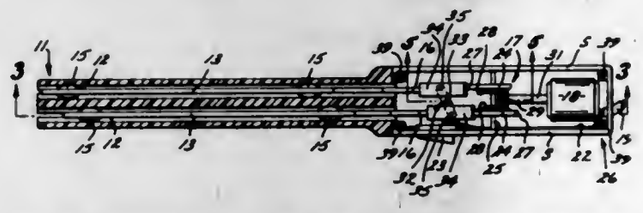
3,272,020
FLOAT OPERATED SIGNAL DEVICE
Chester J. Witt, Deerfield, Sigmund P. Skoli, Elmwood Park, and Harry G. Mojonnier, River Forest, Ill., assignors to Mojonnier Bros. Co., Chicago, Ill., a corporation of Illinois
Filed June 12, 1964, Ser. No. 374,684
4 Claims. (Cl. 74—18.1)



1. In a float-operated signal device, the combination comprising: a rod adapted to transmit the relative vertical position of a float member; an elastomeric element detachably surrounding said rod circumferentially in compressed engagement therewith whereby to act as both a seal for said rod and a pivot therefor; and a mounting structure for receiving said elastomeric element and preserving the compression thereof; said mounting structure including wall means perforated to pass said rod therethrough and having an annular surface confronting said elastomeric element at one side thereof and said mounting structure further including support means having a surface generally confronting said annular surface at the opposite side of said elastomeric element to provide a groove receiving said elastomeric element, said wall means at one side of said elastomeric element and said support means at the opposite side of said elastomeric element being spaced radially outwardly of said rod for clearance, said rod having groove means in mating relationship to the groove provided by said surfaces and in which the adjacent surface of said elastomeric element is disposed, and fastening means connected to said wall means for urging said surfaces toward each other and compressing said elastomeric element therebetween and into the groove means in said rod to seal the rod and support the same for permissive pivotal movement within said clearance while substantially preventing sliding and rotating movement of the rod.

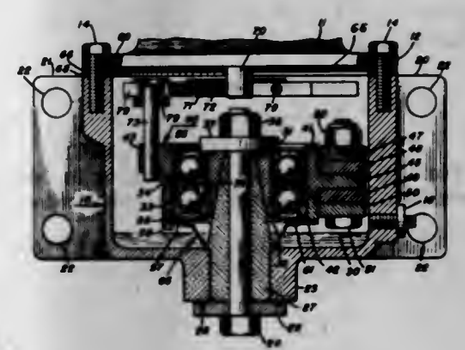
3,272,021
LINEAR ACTUATORS
Milton N. Weber, Dearborn, Mich., assignor to Barry Wright Corporation, Watertown, Mass., a corporation of Massachusetts
Filed Aug. 20, 1964, Ser. No. 390,939
13 Claims. (Cl. 74—25)

1. Apparatus for translating rotational forces into substantially rectilinear forces at different force levels, comprising a threadless shaft, an actuator unit including roller means in frictional engagement with the exterior of said shaft and rotatable in skewed relationship to the longitudinal axis of said shaft, means producing relative rotation between said shaft and said actuator unit and thereby producing forces therebetween in direction of said axis, and means varying the pressure of frictional engagement between said roller means and shaft in accordance with relative orientations of said actuator unit and shaft along said axis.



3,272,022
SLIDE ACTUATING MECHANISM FOR A MACHINE TOOL
Adolf Spinner, 38 Dachauer Strasse, Munich, Germany
Filed Dec. 18, 1963, Ser. No. 331,412
12 Claims. (Cl. 74—53)

1. In a cutting tool arrangement, in combination:
(a) a support;
(b) a cam member mounted on said support and having a cam face;
(c) means for actuating movement of said cam member on said support;

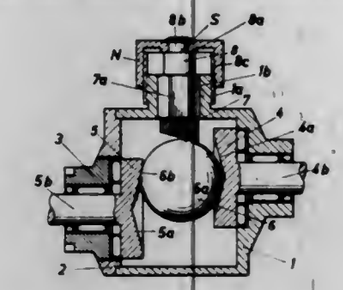


(d) a cam follower engageable with said cam face for movement thereby when said cam member moves;
(e) a slide member movably mounted on said support;
(f) linkage means connecting said cam follower to said slide member for joint movement;
(g) a first abutment member connected to said cam follower for joint movement, said abutment member moving in a predetermined direction when said cam follower is moved by said cam member, said abutment member having an abutment face;
(h) a second abutment member movable on said support toward and away from abutting engagement with an aligned portion of said abutment face in a direction substantially transverse of said predetermined direction; and
(i) yieldably resilient means permanently urging said second abutment member toward said engagement,
(1) said abutment face having two portions consecutive in said predetermined direction and alignable with said second abutment member,
(2) one abutment face portion being substantially perpendicular to said transverse direction when aligned with said second abutment member, and
(3) the other abutment face portion being obliquely inclined relative to said directions in such a manner that said cam follower is urged by said resilient means toward said cam member when said second abutment member engages said second abutment face portion.

3,272,023
POWER-DRIVEN APPARATUS FOR OPPOSITELY RECIPROCATING A PAIR OF SPACED MEMBERS
James Ferguson and Catherine M. Ferguson, both of 14350 Vose St., Van Nuys, Calif.
Filed Nov. 16, 1964, Ser. No. 411,191
6 Claims. (Cl. 74—55)

1. A power-driven apparatus for oppositely reciprocating a pair of spaced applicatory members, comprising: a pair of applicatory members, each having a longitudinal slide member connected thereto and each having a rearwardly directed attachment shank portion; a longitudinal guide means having a pair of laterally spaced, parallel, longitudinally directed guide slots defined therein slidably longitudinally receiving and retaining therein corresponding ones of said longitudinal slide members; reciprocation means positioned in effective driving and reciprocating relationship with respect to one of said attachment shank portions of one of said applicatory members for longitudinally reciprocating same with respect to said longitudinal guide means, and in 180 degree out of phase driving and reciprocating relationship with respect to the other attachment shank portion of the other applicatory member for longitudinally reciprocating same with respect to said longitudinal guide means in exact opposition to the reciprocation of said first-mentioned applicatory member, said reciprocation means being provided with driving controllably energizeable and de-energizeable electric motor means coupled thereto, said reciprocation means comprising a pair of cam members having projecting eccentric cam lobe portions positioned in 180 degree phase-displaced relationship with respect to each other and mounted for simultaneous rotation in effective rotating engagement with respect to the corresponding ones of said attachment shank portions of said applicatory members; and a pair of coupling block members, each effectively receiving and being effectively coupled with respect to a corresponding one of said attachment shank portions of said applicatory members and each having a rear abutment cam follower surface cooperable with the corresponding cam member for forcible forward movement thereby; said cam members having inner surfaces which are effectively bevelled and effectively provided thereon with bevel gear means, said driving motor being provided with a driving bevelled gear simultaneously engaging the bevel gear means of each of said cam members for simultaneously rotating same in opposite directions.

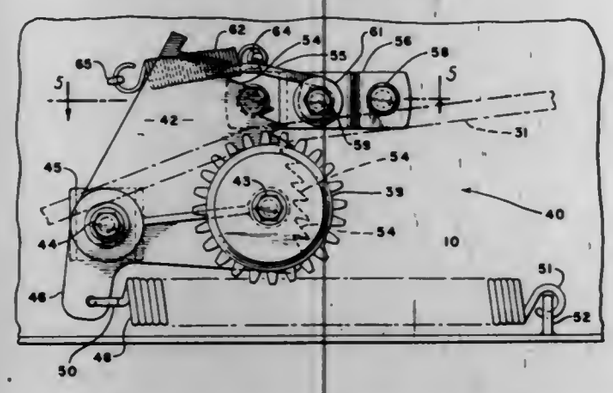
3,272,024
ELECTRO-MECHANICAL GYRATOR
Eugene A. Wahl, 294 Forest Ave., Glen Ridge, N.J.
Filed Aug. 31, 1964, Ser. No. 393,296
8 Claims. (Cl. 74—87)



1. A gyrator comprising,
(a) a main housing open at one end,
(b) a central, vertical support secured to and extending into the housing, said support having a conical surface and an axial hole extending therethrough,
(c) a bearing shaft having a matching conical hole extending axially therethrough and carried by the said support, said bearing shaft having an integral outwardly-extending shoulder,
(d) bearing means carried by and encircling said bearing shaft, said bearing means resting upon the said shoulder,
(e) means securing the bearing shaft in fixed position relative to the said support, said means comprising a bolt passing through the said axial hole, a washer, and a nut threaded onto the bolt and pressing the washer into engagement with the said bearing means,
(f) a bearing housing carried by said bearing means and having an outwardly-extending radial flange,
(g) power means having a rotatable drive shaft extending into the housing in spaced, axial alignment with the said bearing shaft, and
(h) means mechanically coupling the said drive shaft to the said bearing housing.

3,272,025
INFINITELY VARIABLE SPEED POWER TRANSMISSION, ESPECIALLY BALL FRICTION TRANSMISSION
Ortwin Stieber, Moosacherstrasse 51, Munich, Germany
Filed May 20, 1964, Ser. No. 368,946
18 Claims. (Cl. 74—198)

1. An infinitely variable ball transmission which includes: housing means, a power input shaft rotatably journalled in said housing means, a power output shaft rotatably journalled in said housing means in axially spaced relationship to said power input shaft, said power

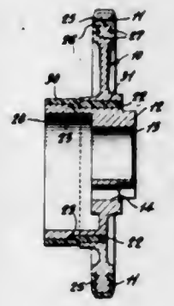


output shaft having its axis of rotation substantially parallel to the axis of rotation of said power input shaft, said shafts respectively having those end faces thereof which face toward each other provided with a conical surface, said conical surfaces flaring toward each other, a transmission ball interposed between and in substantially point contact only with said conical surfaces, and adjustable abutment means adjustable selectively toward and away from said shafts for abutment with said ball, said adjustable means being closer to the axis of rotation of said power input shaft than to the axis of rotation of said power output shaft.

3,272,026
TENSION CONTROL DEVICE

John K. Hale, New Holland, Pa., assignor to Sperry Rand Corporation, New Holland, Pa., a corporation of Delaware

Filed Oct. 14, 1964, Ser. No. 403,856
2 Claims. (Cl. 74—242.11)

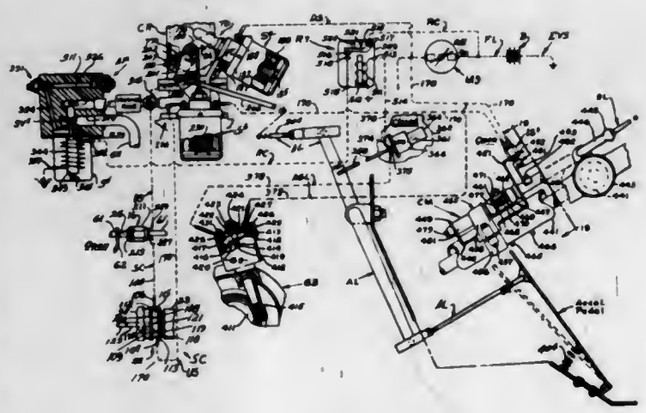


1. Mechanism for controlling slack and tension in an endless drive chain having a reach moving in a predetermined direction in a given plane, said mechanism comprising an idler sprocket disposed in said plane in meshing engagement with said chain reach, a plate-like member disposed adjacent said chain reach and lying in a plane parallel to said given plane, means journalling said plate-like member for pivotal movement about a fixed axis perpendicular to said given plane, means journalling said sprocket on said plate-like member for movement therewith generally transverse to the direction of travel of said chain reach, a spring connected to said plate-like member and urging said member in a given direction about said fixed axis to move said sprocket transversely of said chain reach and take up slack in the chain, a pawl member, means mounting said pawl member adjacent said plate-like member for pivotal movement about an axis parallel to said fixed axis and for limited to-and-fro movement toward and away from said plate-like member, a series of ratchet teeth formed in said plate-like member in position to move consecutively past said pawl member upon movement of said plate-like member in said given direction, the spacing between consecutive teeth in said series of ratchet teeth progressively diminishing from the first tooth to move past said pawl to the last tooth to move past said pawl, and spring means urging said pawl member into engagement with said ratchet teeth to prevent pivotal movement of said plate-like member about said fixed axis in a direction opposite said given direction beyond the limited extent of to-and-fro movement of said pawl member.

3,272,027
INTEGRAL GEAR AND DRIVE ECCENTRIC UNIT

William R. Wayman, Indianapolis, Ind., assignor to Link-Belt Company, a corporation of Illinois

Filed Nov. 18, 1964, Ser. No. 412,603
5 Claims. (Cl. 74—243)

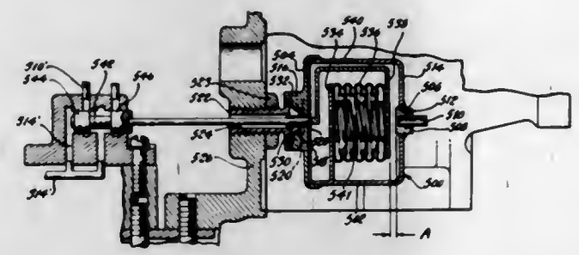


1. An integral gear and drive eccentric unit comprising
a circular gear body having a toothed portion around the perimeter of said body,
a hub integral with and centrally disposed on said body for mounting said unit on a shaft,
a cylindrical drive eccentric integral with said body and extending from one side of said circular gear body eccentric to the axis of said hub,
a plastic casing molded over said toothed portion on said circular gear body and enclosing a peripheral portion of said body radially inwardly of said toothed portion,
and a plastic sleeve bonded to and encasing said cylindrical drive eccentric.

3,272,028
SYNCHRONIZING MECHANISM ADAPTED FOR FRICTION CLUTCH USE

Glenn T. Randol, 3 E. 2nd Ave., Loch Lynn, Mountain Lake Park, Md.

Filed Sept. 21, 1962, Ser. No. 225,426
17 Claims. (Cl. 74—472)

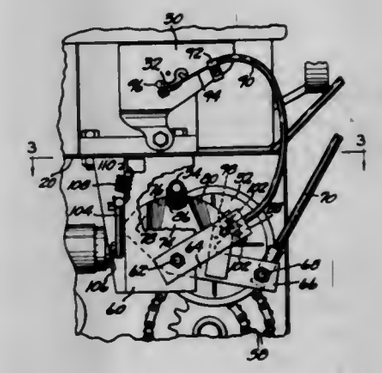


1. In synchronizing mechanism adapted for use in cooperation with two frictionally-engageable relatively rotatable elements, comprising: a pair of normally co-rotatable actuatable members operatively disposed between said friction elements, with one of said members connected for co-rotation with one of said friction elements; a ring-like brake and drive element having continuous frictional engagement with a complemental frictional surface on the other of said two friction elements; a mechanical connection between said ring-like element and the other of said pair of actuatable members to effect co-rotational movement thereof; a lost-motion mechanical connection between said pair of actuatable members to provide relative rotational movement between two predetermined limits; camming means operatively incorporated between said pair of actuatable members and adapted to convert said relative rotational movement therebetween into axial operating movement of the other actuatable member; spring means including a normally compressed spring reacting between said ring-like element and the one friction element for maintaing said ring-like element in frictional engagement with the other of said friction elements whereby relative overspeed of the other friction element with respect to the one friction element rotates the other actuatable member to effect one of its axial operating positions defined by one of said predetermined limits, and relative underspeed of said other friction element with respect to the one friction element rotates the other actuatable member to effect its other axial operating position defined by the other of said predetermined limits; torque-producing means connected to said one friction element to rotate as a unit therewith; control means for regulating the speed defining the torque output of said torque-producing means; and a control device operable to two operating positions of control in response to the two axial operating positions, respectively, of said other actuatable member for selectively controlling the said control means to effect regulation of the speed of said torque-producing means into synchronism with the overspeed or underspeed of said other friction element prior to establishment of co-rotational movement of the two friction elements aforesaid.

3,272,029
AUTOMATIC POWER TRANSMISSION SYSTEM

James J. Duffy, Livonia, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware

Filed Apr. 12, 1963, Ser. No. 272,746
8 Claims. (Cl. 74—472)



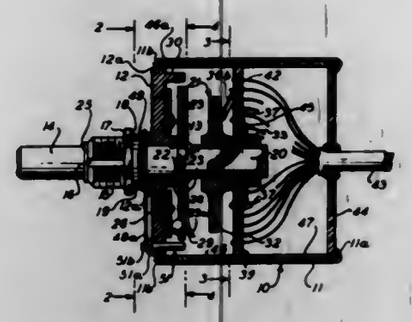
5. In a power transmission mechanism, torque delivery elements defining plural torque delivery paths between a driven member and an engine with an air intake manifold, each path being characterized by a separate torque ratio, fluid pressure operated control means for completing selectively said paths, a fluid pressure source, conduit structure interconnecting said source and said control means, modulator valve means in fluid communication with said source and said control means for establishing a pressure signal that is related functionally in magnitude to engine manifold pressure, governor means for establishing a speed signal that is an indicator of the driven speed for said driven member, means for subjecting said control means to said speed signal and said pressure signal, said modulator valve means comprising a servo mechanism defining a vacuum chamber, an evacuated aneroid bellows in said chamber, said chamber communicating with the engine intake manifold, one end of said bellows being connected to a relatively stationary portion of said servo, and a valve actuator rod connected to a movable portion of said modulator valve means, said rod being connected to the other end of said bellows.

3,272,030
COMBINED ENGINE THROTTLE AND TRANSMISSION CONTROL MEANS

Peter P. Blozis, Michigan City, Ind., assignor, by mesne assignments, to Hahn, Inc., a corporation of Indiana

Filed Mar. 5, 1964, Ser. No. 349,574
6 Claims. (Cl. 74—472)

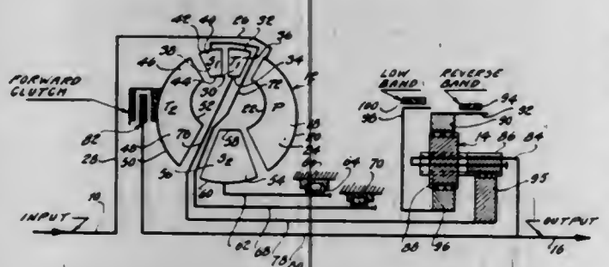
1. A control device for controlling an engine driven device having a throttle shiftable between idling and accelerating positions and a reversible drive transmission device having a control part shiftable between "forward," "neutral" and "reverse" positions, comprising
a control member shiftable on said engine driven device for positioning said control part,
a manually operable controller shiftable on said engine driven device, for selectively actuating said control member,
means actuated by said controller and connected to said throttle to position said throttle in idling position while said control part is in neutral position and to advance said throttle to an accelerating position when said control part is shifted clear of neutral position,
said control member constituting a cam plate rotatable on an axis substantially parallel to the path of movement of said transmission control part and including segments extending in angularly related planes, and
a cam follower carried by said transmission control part and straddling said cam plate.



3,272,031
ADJUSTABLE STOP FOR ROTARY SELECTOR SWITCHES

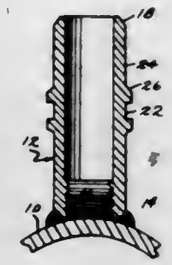
Herbert H. Beck, Whippany, N.J., assignor to McGraw-Edison Company, Elgin, Ill., a corporation of Delaware

Filed Apr. 29, 1965, Ser. No. 451,739
9 Claims. (Cl. 74—526)



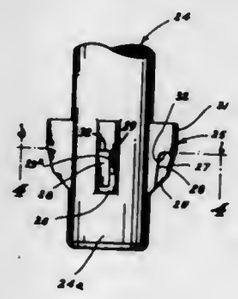
1. A rotary selector switch having an end panel, a rotor and a shaft for said rotor journaled in said end panel, a leaf spring pivoted on said end panel about said shaft as a center, means frictionally gripping the hub portion of said spring, a series of circumferentially spaced holes in said end panel about said shaft as a center, said holes being spaced by the angular distance about said shaft between successive switch positions, a stud end removably mounted in a selected one of said holes and in seating relation with said end panel, said stud pin having an inner end portion projecting beyond said panel when the stud pin is in a seated position, said leaf spring being shiftable to bring an

outer end portion in engagement with said stud pin to hold the stud pin seated in a selected hole, and an arm secured to said shaft having an outer end portion movable



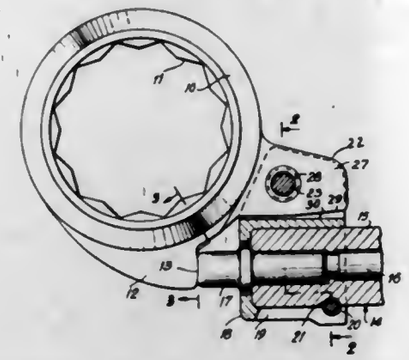
into abutment with the inner end portion of said stud pin as the shaft is turned whereby to provide a selected end stop for said rotor.

3,272,032
HYDROKINETIC POWER TRANSMISSION MECHANISM INCLUDING MULTIPLE ELEMENT TORQUE CONVERTER
Steven Smalinskas, Detroit, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Mar. 5, 1964, Ser. No. 349,679
4 Claims. (Cl. 74—677)



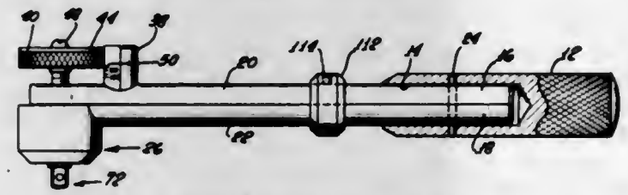
1. A hydrokinetic power transmission comprising a hydrokinetic torque converter and a planetary gear system that cooperate to define the torque delivery paths from a driving member to a driven member, said torque converter comprising an impeller, a primary turbine, a primary stator, a secondary turbine and a secondary stator situated in toroidal fluid flow relationship in a common torus circuit, said gear system comprising a first sun gear, a second sun gear, a ring gear, first planet pinions engageable with said second sun gear, second planet pinions engageable with said first sun gear and also with said ring gear and said first planet pinions, a carrier rotatably supporting said planet pinions, said carrier being connected to said driven member, clutch means for connecting selectively said secondary turbine to said driven member, first overrunning brake means for anchoring said secondary stator against rotation in a forward direction opposite that of said impeller and permitting freewheeling motion thereof in a second direction, second overrunning brake means for inhibiting rotation of said primary stator in a forward direction opposite that of the said impeller but accommodating freewheeling motion thereof in a second direction, a turbine shaft connected to said second sun gear, a first torque transmitting web connecting said turbine shaft to said primary turbine and extending through an inner region of the torus circuit between the exit section of said secondary turbine and the entrance region of said secondary stator, and reaction brake means for anchoring selectively said first sun gear during operation of said mechanism in a low speed ratio range thereby conditioning said gear system to multiply the effective torque developed by said primary turbine.

3,272,033
DRILLING APPARATUS FOR CONNECTING A SERVICE LINE TO A MAIN WITHOUT ESCAPE OF FLUID FROM THE MAIN TO THE ATMOSPHERE
Wilbur R. Leopold, Jr., John J. Smith, and Lawrence F. Luckenbill, all of Decatur, Ill., assignors to Mueller Co., Decatur, Ill., a corporation of Illinois
Original application Sept. 21, 1962, Ser. No. 225,194. Divided and this application Jan. 30, 1964, Ser. No. 341,183
2 Claims. (Cl. 77—40)



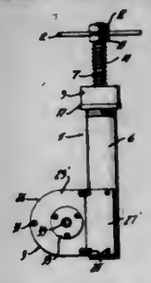
1. In drilling apparatus the combination comprising: a drill having a shank of reduced diameter and a noncircular section at the forward end of said shank; a chip-collector comprising a sleeve snugly enclosing said drill and having exterior threads on its forward end and a reduced interior configuration at its rearward end complementary to said drill noncircular section and engageable therewith to restrain relative rotation between said drill and chip-collector, the forward end of said chip-collector, when so restrained, being located beyond the forward end of said drill; spring means engaged with said drill and chip-collector for yieldably urging the latter forwardly of the former; and interengageable shoulders on said drill and in said chip-collector to limit forward movement of the latter to a position wherein said configuration is engaged with said section.

3,272,034
TOOL FOR LOCKING THREADED INSERTS IN THREADED BORES
José Rosán, San Juan Capistrano, Calif., assignor to Rosan Engineering Corp., Newport Beach, Calif., a corporation of California
Original application Dec. 12, 1960, Ser. No. 75,411. Divided and this application Aug. 10, 1964, Ser. No. 392,069
7 Claims. (Cl. 81—3)



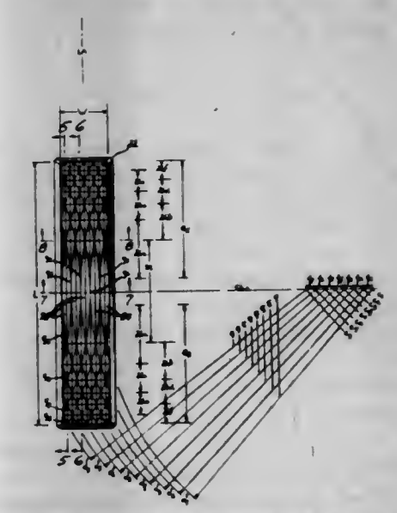
1. A locking tool for locking an insert having an axially slotted head into a workpiece, comprising: a cylindrical body; radial projections longitudinally spaced from one end of said body, a portion of the faces of said projections being radially, inwardly displaced from said faces to form a tapered wedge surface adapted to engage the edges opposite the threading direction of said insert of the segments formed by said axial slots.

3,272,035
HAMMER DRIVEN WRENCH
Gösta Ivar Ekström and Stig Hugo Nordahl, Nacka, Sweden, assignors to Atlas Copco Aktiebolag, Nacka, Sweden, a corporation of Sweden
Filed Apr. 20, 1964, Ser. No. 361,106
Claims priority, application Sweden, Apr. 24, 1963, 4,467/63
9 Claims. (Cl. 81—52.3)



1. A hammer driven wrench operated by impacts and including power operated reciprocating hammer means for delivering a series of rotational blows to a wrench body, said hammer driven wrench comprising a wrench body, a radially directed outer lug centrally on and integral with said wrench body, said lug having a radial shoulder thereon, a pivot on said wrench body spaced from but parallel with the axis of rotation of said wrench body and angularly spaced from said lug, handle means mounted on said wrench body for limited bidirectional rotation thereon on said pivot, said handle means including a head portion carrying said pivot and a shaft portion disposed substantially tangentially to said wrench body and with the longitudinal axis on said shaft portion intersecting said shoulder, said shaft portion consisting of a pressure fluid operated hammer having an impact delivering surface disposed concentrically with respect to the axis of said shaft portion and adjacent said shoulder, and said hammer being operable for imparting rotational blows by said impact delivering surface to said shoulder.

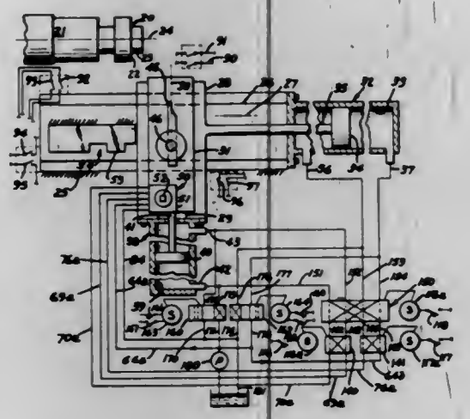
3,272,036
TORQUE LIMITING WRENCH
William E. Van Hoose, 4117 Brompton Ave., Bell, Calif.
Filed Oct. 30, 1964, Ser. No. 407,658
13 Claims. (Cl. 81—52.4)



1. A torque limiting wrench comprised of two complementary coaxial rotatable members mounted for rotation relative to one another about their common axis, the first said rotatable member including internal bearings and a handle, and the second said rotatable member mounted within the first rotatable member, said second rotatable member including a torque transfer member and radially mounted cam means, an actuating member resiliently mounted for axial movement within said second rotatable member which presses against and radially urges said cam means, means for adjustable frictional locking of said second rotatable member with said first rotatable member about their common axis through adjustable radial urging of the cam means outwardly against said internal bearings caused by axial pressure applied by said actuating member on said cam lock means and responsive radial locking between the first and second rotatable members up to a predetermined torque limit beyond which the first rotatable member will rotate independently of the second rotatable member, and means for adjusting the radial pressure of the first rotatable member relative to the second rotatable member so as to vary the amount of frictional engagement of the internal bearings of the first rotatable member with the cam means of the second rotatable member.

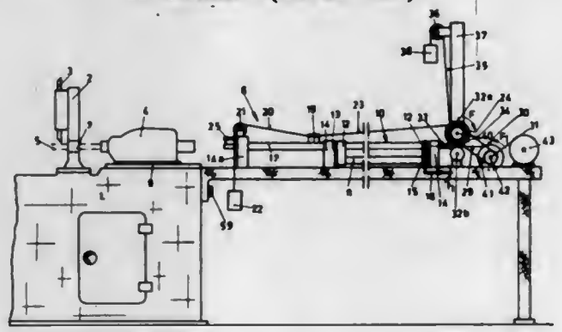
3,272,037
MECHANICAL TURNING TOOL UNIT
Jerome J. Bruehl, 726 Valley Road, Menasha, Wis.
Filed May 20, 1964, Ser. No. 368,934
7 Claims. (Cl. 81—57)

1. A multiple action turning tool unit comprising,
an elongated support adapted to be manually manipulated,
a gear rotatably mounted in one end of the support and having ratchet means for coupling a turning tool means thereto,
an operating shaft slidably and rotatably mounted to the support for limited reciprocating movement,
a worm secured to the shaft and mating with said gear, said worm projecting from the gear for a length permitting said worm to serve as a rack to turn the gear upon reciprocal movement of the shaft, and
stop means on the shaft and support limiting movement of the operating shaft in both directions to thereby permit limited reciprocation and providing a reacting stop upon turning of the shaft to prevent longitudinal movement of the shaft and thereby transmitting shaft rotation to the gear.



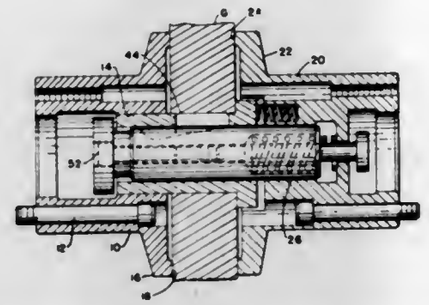
3,272,038
GRIPPING MEANS
William M. Burstall, Huffman, Tex., assignor to Byron Jackson Inc., Long Beach, Calif., a corporation of Delaware
Filed Apr. 1, 1965, Ser. No. 444,763
14 Claims. (Cl. 81—186)

8. A gripping means comprising an elongated surface including at least two intersecting groups of grooves



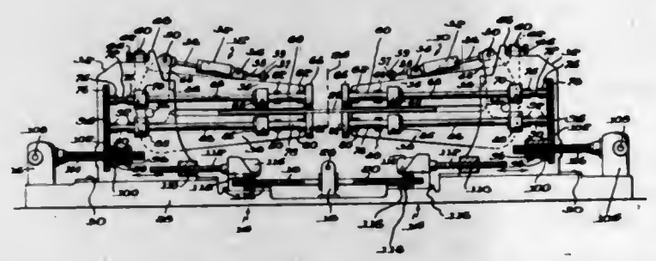
superimposed upon each other, each of said grooves defining an arc of a circle.

3,272,039
MACHINE TOOL CYCLE CONTROL
Paul J. Weaver, Pasadena, Calif., assignor to True-Trace Corporation, El Monte, Calif., a corporation of Connecticut
Filed May 26, 1965, Ser. No. 458,962
19 Claims. (Cl. 82—14)



1. A cycling control for a machine tool of the class having a bed, a first slideway mounted on said bed, a first slide mounted on the first slideway, a second slideway mounted on the first slide, a second slide mounted to the second slideway, the slideways having respective axes, the axes being non-parallel and the slides being movable along the respective slideway axis, a cutting tool, a workpiece holder, a template, and a tracer valve including a stylus adapted to trace the contour of the template, the tracer valve and template comprising a first pair and the cutting tool and workpiece constituting a second pair, one member of each pair being mounted to the second slide, and the other member of each pair being mounted to the bed, a first slide motive means, and a second slide motive means, the first slide motive means being adapted to move the first slide relative to the bed along the first axis, and the second slide motive means being adapted to move the second slide relative to the first slide along the second axis, at least one of said motive means being under control of the tracer valve, whereby variations in the template contour are followed by the stylus and duplicated between the cutting tool and workpiece, motive power means selectably applicable directly to the motive means or through the tracer valve to the motive means, the selection of which if any of said motive means is under control of the tracer valve, and the selection of which if any of said motive means is directly powered by the power means exemplifying selectable functions, said cycling control comprising: a power supply including a first and a second terminal; a plurality of limit switches disposed in the path of said slides, each having a conductive and non-conductive condition, said conditions being selectable by contact with a respective slide, whereby movement of a slide to a selected location actuates a respective limit switch to change its conductive condition, each of said limit switches including a first and a second terminal, which terminals are conductively connected in one condition, and disconnected in the other; a plurality of address switches; a plurality of function switches, each of said address and function switches having a conductive and a non-conductive condition, said conditions being selectable, and each of said function and address switches including a power and an output terminal, the first terminals of all limit switches being connected to the first terminal of the power supply, the second terminal of each limit switch being connected to the power terminal of a respective address switch, the power terminals of all the function switches being connected to the first terminal of the power supply; a switch controller comprising a drum with an axis of rotation, the drum having a periphery revoluble around said axis; a plurality of switch actuators on said periphery, said address and function switches being so disposed and arrayed as to be placed in one condition when a switch actuator is adjacent thereto, and in the other condition when one is not, whereby the disposition of switch actuators on the periphery relative to the address and function switches provides means for selecting addresses and functions respective to angular positions of the drum; stepper means for moving the drum in incremental steps, said stepper means including a first and a second terminal, the output terminals of all address switches being connected to one terminal of said stepper means the other terminal of the stepper means being connected to the second terminal of the power supply; a plurality of function controllers each effective to control a function and each having a first and a second terminal, the first terminal of each function controller being connected to the output terminal of a respective function switch, and the second terminal of all function controllers being connected to the second terminal of the power supply, whereby with the drum so disposed and arranged as to actuate a selected address and function switch, the function continues until the respective limit switch is actuated, thereby to step the drum to a new selection.

3,272,040
ARRANGEMENT FOR FEEDING AN AUTOMATIC LATHE WITH BARS TO BE MACHINED
André Léchot, Ateliers de Mecanique, Orvin, Bern, Switzerland
Filed Feb. 10, 1964, Ser. No. 343,557
Claims priority, application Switzerland, Feb. 8, 1963, 1,579/63
13 Claims. (Cl. 82—2.7)



1. In combination with a lathe including a slidable headstock provided with a bore and at least one cutting tool, an arrangement for feeding bars to be machined into the headstock bore, comprising a magazine including a plurality of similar horizontal tubes parallel with the axis of the headstock bore and adapted to carry each a bar to be machined and to be set in succession in alignment with the headstock bore, a main cable, means detachably connecting one end of said cable with the bar carried inside the operative tube aligned with the headstock bore through the end of said bar facing away from said headstock bore, two rollers between which the cable is frictionally held, a weight, an auxiliary cable to which said weight is suspended and adapted to drive the roller in a predetermined direction into rotation upon release of the weight to thereby move the main cable and bar forwardly through last-mentioned tube to ensure machining the bar in the lathe, means guiding the main cable along a rectilinear path between the rollers and said last-mentioned tube and further driving means adapted to be operatively connected with last-mentioned roller to drive same in the direction opposed to said predetermined direction to draw the main cable outwardly away from said last-mentioned tube.

3,272,041
EXPANDING ARBORS
Russel W. Anthony, Detroit, Mich., assignor to National Broach & Machine Company, Detroit, Mich., a corporation of Michigan
Filed June 28, 1965, Ser. No. 467,239
13 Claims. (Cl. 82—44)

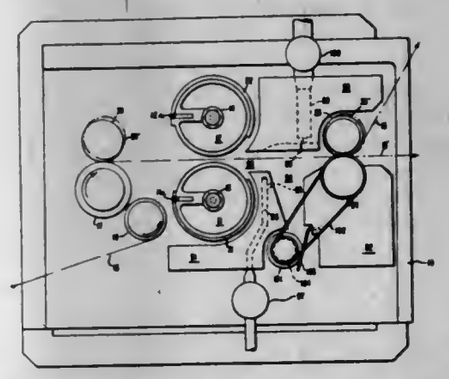
1. Expanding arbor support means comprising a first support member including a central circular recess to serve as piloting means, and a flat annular work support surface concentric with said recess, a second support member, an elongated plug carried by said second support member in axial alignment with the recess in said first support member, a sleeve slidable longitudinally on said plug, radially movable keys in said sleeve, key camming surfaces on said plug, spring means between said sleeve and said second support member, and stop means interposed between said sleeve and plug to limit movement of said sleeve on said plug.

3,272,042
SLITTING AND SCORING APPARATUS
James P. Haas, Baltimore, Md., assignor to Koppers Company, Inc., a corporation of Delaware
Filed Dec. 23, 1964, Ser. No. 420,622
5 Claims. (Cl. 83—9)

1. A device for slitting and scoring a continuously moving sheet comprising

a frame member having a pivot pin extending horizontally therefrom and stop means extending horizontally therefrom,

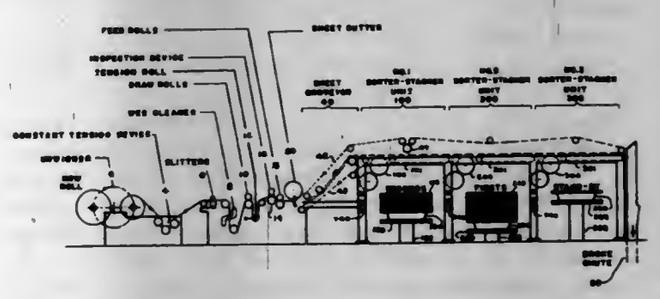
an upper pivot arm pivotally secured to said frame member on said pivot pin and having an end portion extending laterally from said frame member,



a lower pivot arm pivotally secured to said frame member on said pivot pin and having an end portion extending laterally therefrom positioned below said upper pivot arm member laterally extending portion, said lower pivot arm having an upwardly extending other end portion operable to abut said frame member stop means,

means connected to said upper arm member laterally extending portion and said lower arm member upwardly extending other end portion, said means operable to urge said lower arm member other end portion into abutting relation with said stop means and to pivot said upper arm member about said pivot axis in a direction away from said continuously moving sheet,

sheet engaging members secured to said upper and lower pivot arm laterally extending portions, said sheet engaging members arranged in a plane substantially normal to the longitudinal axis of said arm member laterally extending portions, and



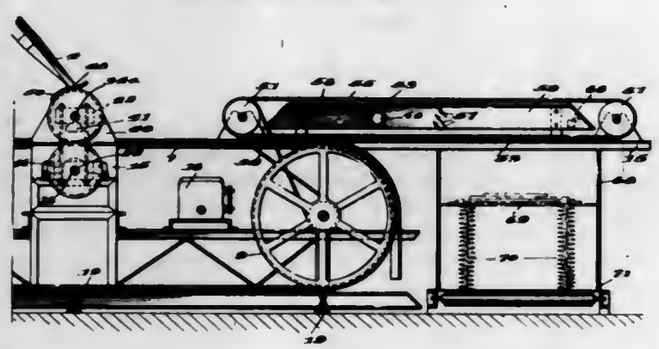
drive means to propel said sheet engaging members.

3,272,043
METHOD AND APPARATUS FOR SEVERING A MOVING WEB
Danahey Ryan, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Oct. 31, 1963, Ser. No. 320,419
9 Claims. (Cl. 83—24)

8. A method for severing a web while maintaining positive tension on the web which comprises (1) initiating (a) knife rolls located on each side of the web to begin rotation and (b) the engagement of a free running guide roll and power driven roll, (2) cutting said web while a firm grasp is maintained on said web by said knife rolls, (3) supporting the leading edge of said cut web with an air cushion, (4) receiving the leading edge of said cut web between said engaged guide roll and power driven roll and (5) disengaging said guide roll and power driven roll upon an impulse from a web detector which sensed the web after passage from said rolls.

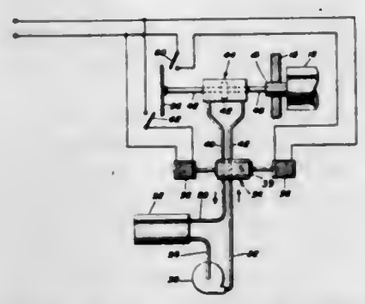
3,272,044
SINGLE WEB SHEET CUTTING MECHANISM
David Noel Obenshain, Luke, Md., assignor to West Virginia Pulp and Paper Company, New York, N.Y., a corporation of Delaware
Original application Oct. 9, 1962, Ser. No. 230,790, now Patent No. 3,203,326, dated Aug. 31, 1965. Divided and this application Mar. 6, 1964, Ser. No. 349,966
10 Claims. (Cl. 83—79)

1. A high speed, single web, sheet cutting and delivering mechanism comprising, in combination, conveying means for advancing sheet material in web form, a rotary cutter, a collecting drum, a common driver for the cutter,



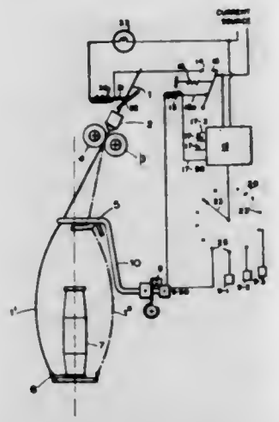
the web conveying means and the collecting drum, power transmitting means connecting the cutter and the collecting drum for operation at identical rotary speeds and in fixed relation to the common driver, a positive change speed transmission unit interposed between the common driver and the web conveying means and settable to control the length of web fed during a cutter cycle, thereby to determine the length of sheet cut, and means for accelerating each cut sheet, regardless of its length, from the speed of the web to the peripheral speed of the collecting drum so that the successive sheets delivered to the collecting drum may be collected thereon in registering packets, a transfer conveying means for receiving the sheet packets from the collecting drum, means automatically effective when the prescribed number of sheets has been accepted for accumulation on the collecting drum to bring about delivery of the resulting sheet packet to the transfer conveying means, receiving mechanism for accepting the packets from the transfer conveying means at greatly reduced speed, means driving the transfer conveying means at the peripheral speed of the collecting drum throughout said delivery, and automatically effective when the delivery of a packet of sheets to the transfer conveying means has been completed, to so modify the transfer conveying means drive that the transfer conveying means is put through a slowdown and restoration cycle during which the transfer conveying means advances the sheet packet at high speed onto the receiving mechanism and then slows down progressively as the packet moves across the receiving mechanism until the packet of sheets is discharged to said receiving mechanism at a relatively low speed, the transfer conveying means drive then progressively restoring the speed of the transfer conveying means to the collecting drum speed by a time no later than that at which the next accumulated packet of sheets on the collecting drum becomes ready for delivery to the transfer conveying means.

3,272,045
FLYING SHEAR
William Cookson, Southampton, England, assignor to Cookson Sheet Metal Developments Limited, Southampton, England, a company of Great Britain and Northern Ireland
Filed Feb. 10, 1964, Ser. No. 343,560
Claims priority, application Great Britain, Feb. 18, 1963, 6,539/63
16 Claims. (Cl. 83—308)



1. A flying shear for cutting into predetermined lengths material of the kind described comprising:
- shear blades between which the material is made to pass; a mounting for the shear blades which is forwardly movable with the material;
- engagement means connected with the shear blades mounting at a desired distance in front of the shear blades in the line of advance of the material so as to be engageable by the material and move forward the shear blades mounting leaving a predetermined length of material in front of the blades;
- cam means for causing the shear blades to close together in a cutting action as the shear blades mounting is moved forward including a cam element connected to one of the shear blades and an interacting cam element connected to a fixed part of the flying shear mechanism.

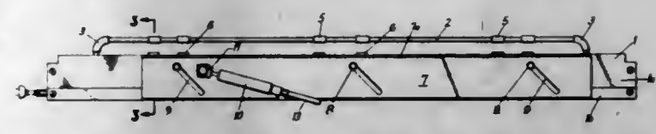
3,272,046
ROTARY CUTTING APPARATUS
Fred P. Crouch and Wilbur M. Lockrow, Winston-Salem, N.C., assignors, by mesne assignments, to Hanes Corporation, Winston-Salem, N.C., a corporation of North Carolina
Original application May 27, 1963, Ser. No. 283,252, now Patent No. 3,192,809, dated July 6, 1965. Divided and this application Feb. 18, 1965, Ser. No. 449,349
7 Claims. (Cl. 83—310)



1. Apparatus for continuously cutting a web of knitted or woven cloth into a plurality of repeating garment blank portions comprising: a frame, a hard-surfaced non-resilient pressure roller and bearing supports mounting the pressure roller on the frame for rotation about a fixed horizontal axis, the periphery of the pressure roller defining circular end sections and a recessed intermediate section; a pair of end wheels mounted for rotation on the frame and a non-resilient, hard-surfaced belt passing around the end wheels, the hard-surfaced belt being carried in the recessed section of the pressure roller for positive transverse positioning thereof; means driving the hard-surfaced belt at a predetermined linear speed and further rotating the pressure roller with a peripheral speed equal to the linear speed of the belt; a non-resilient cutter roller mounted for rotation about an axis parallel to the pressure roller axis, the cutter roller having at its periphery, raised hard-surfaced cutting edges shaped to form a plurality of garment blank portions and intermediate waste portions from a web of cloth; collar means rigidly holding the cutter roller against the pressure roller and the portion of the belt carried at the recessed section of the pressure roller; and means for rotating the cutter roller at a peripheral speed equal to the peripheral speed of the pressure roller.

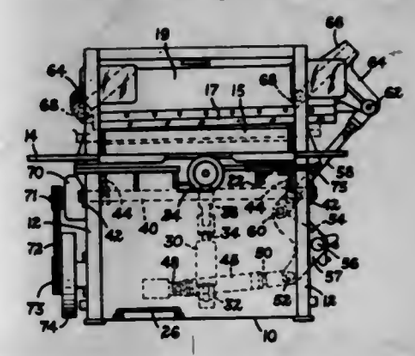
3,272,047
HYDRAULIC ROLL OSCILLATING DEVICE
William F. Ward, 1706 Kurtz Ave., Lutherville, Md.
Filed Nov. 20, 1963, Ser. No. 324,926
3 Claims. (Cl. 83—338)

1. In a rotary die-cut machine for cutting of sheet material, a pair of rotatably mounted rolls, one of said rolls having a resilient covering and the other of said rolls having cutting means impressed against the surface of said resilient covering for severing of said sheet material when passed between said pair of rolls, a double-acting hydraulic cylinder having one end of its piston shaft connected to one end of the shaft of said one roll for longitudinally oscillating it with respect to said other roll, a source of hydraulic pressure, a pair of hydraulic lines for supplying hydraulic fluid to said hydraulic cylinder, a reversing valve for reversing the direction of hydraulic fluid flow through said hydraulic cylinder to obtain the longitudinal oscillation of said one roll, a pair of spaced switch means for defining the limits of said longitudinal oscillation, striker means mounted on the opposite end of said piston shaft for alternately actuating said spaced switch means, and solenoid means energized by said spaced switch means to reverse said reversing valve in response to the alternate actuation of said spaced switch means by said striker means.



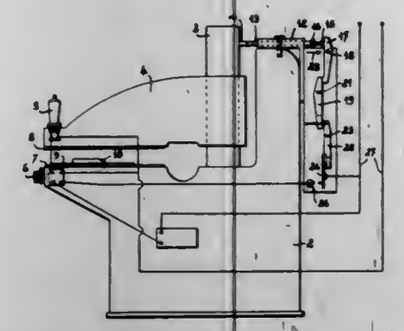
3,272,048
APPARATUS FOR THE DETECTION OF BROKEN YARN AND THE LIKE ON TEXTILE MACHINES
Anthony Hugh Archer, Horley, Surrey, England, assignor, by mesne assignments, to Louis Newmark Limited, Croydon, England, a British company, and to T.M.M. (Research) Limited, Oldham, England, a British company
Filed Aug. 5, 1964, Ser. No. 387,634
Claims priority, application Great Britain, Aug. 10, 1963, 27,353/63
10 Claims. (Cl. 83—370)

1. A yarn spinning apparatus comprising a yarn drafting means, a yarn guide, means for winding yarn about a bobbin and means for holding a bobbin;
- said drafting means feeding yarn toward said yarn guide and said winding means;
- said yarn guide engaging the yarn between said drafting means and said winding means; the operation of said winding means vibrating said yarn guide by vibrating the yarn in engagement therewith;
- a detector device connected to said yarn guide for detecting a break in the yarn;
- said device being responsive to the presence of vibrations in said yarn guide and being differently responsive to the absence of vibrations in said yarn guide due to a break in the yarn.



3,272,049
WEB SEVERING DEVICE
Otha Cooksey, 2639 Kings Highway, Louisville, Ky. 40205
Filed Dec. 16, 1963, Ser. No. 331,009
1 Claim. (Cl. 83—371)

A web severing device for the purpose described comprising supporting means adapted to be located adjacent to and transverse a traveling web, said supporting means having a surface portion adapted to be at a substantial angle to the plane of the web, knife means having a serrated edge and being mounted for sliding movement upon said surface of said supporting means, said sliding movement having a direction at a substantial angle to the longitudinal axis of said supporting means, means for moving said knife means on said supporting means against said web comprising a fluid pressure cylinder pivoted at one end to said supporting means and having a piston and rod, said piston rod being pivoted to said knife means, control means for introducing fluid under pressure to said cylinder, said control means comprising a three-way valve, a web break detector comprising said supporting



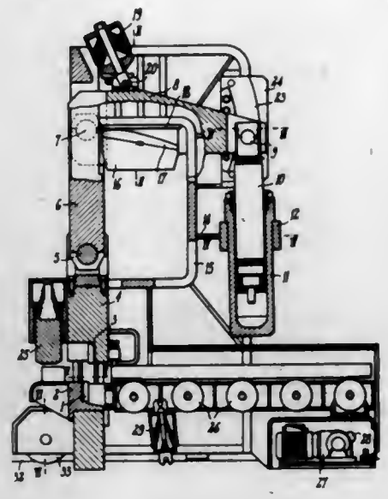
means, said detector comprising an air delivery means on one side of the web, an air actuated switch means on the other side of said web, said air delivery means and said switch means being in parallel spaced relationship to each other, said detector device being so located with respect to the web that both said air delivery means and said switch means are out of contact with said web in its normal path of travel, said switch means actuated by air from said air delivery means when said web deviates from its said normal path of travel, said detector functioning to operate said three-way valve when said switch means is actuated, whereby to actuate said cylinder.

3,272,050
ADJUSTABLE KNIFE AND CLAMP ASSEMBLY
Leo D. Barley, Dayton, Ohio, assignor to Harris-Intertype Corporation, Cleveland, Ohio, a corporation of Delaware
Continuation of application Ser. No. 142,314, Oct. 2, 1961. This application July 26, 1965, Ser. No. 474,925
9 Claims. (Cl. 83—390)

1. A clamp control for use with a cutting machine adapted to cut piles of material, said machine including a knife movable in guillotine-like cutting strokes together with a clamp movable from a raised position to a clamping position against a pile of material and a hydraulic unit providing a power drive for said clamp and knife; said control comprising driving linkage means operatively associated with said hydraulic unit for moving said clamp toward and away from a pile, valve means operative to halt the upward movement of said clamp means and to maintain said clamp in the raised position, means controlling said valve means including a cable of fixed length secured at one end to said driving linkage means and at the other end to said valve means for relating the position of said clamp and for causing said valve to halt the upward movement of said clamp by establishing a condition of hydraulic pressure equilibrium, and adjustable guide means controlling the path along which said cable moves to vary the effective action of said cable on said valve means.

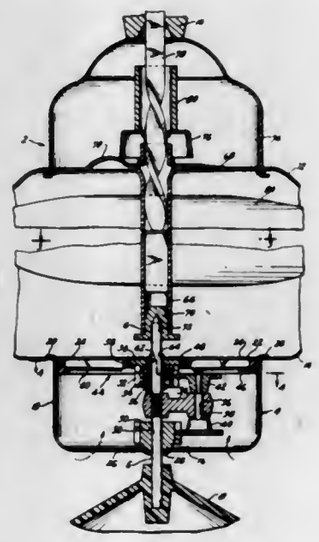
3,272,051
CUTTING AND PERFORATING PRESS
Paul Actis, Ospedaletti, Italy
Filed Aug. 13, 1964, Ser. No. 389,335
Claims priority, application France, Sept. 5, 1963, 43,970, Patent 1,383,805
3 Claims. (Cl. 83—527)

1. In a cutting press comprising a frame including a support for the material to be cut and a presser member adapted to be lowered toward the material to be cut to press a cutting tool through the material, the improvement comprising an upright from which said presser member extends laterally, said upright being adapted to bend yieldingly away from the tool upon pressure of the tool on said material, and means responsive to said bending of the upright to stop the lowering of said presser member.



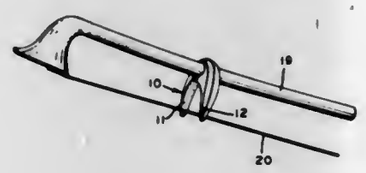
3,272,052
DIE FOR PUNCHING DATA PROCESSING CARDS, TAPES AND THE LIKE
Herbert Mahn, Hamburg, Germany, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Nov. 17, 1964, Ser. No. 411,772
Claims priority, application Germany, Dec. 7, 1963, P 22,609
3 Claims. (Cl. 83—578)

1. A die for punching data processing cards, tapes and the like comprising, a punch and guide, said punch having a cutting surface at one axial end of said punch, a laterally extending recess in said die, a second cutting surface on said punch defined by the edge of said punch extending between said cutting surface and the adjacent surface of said recess, and a second recess in said guide positioned for communication with said punch recess in the inoperative position of said punch.



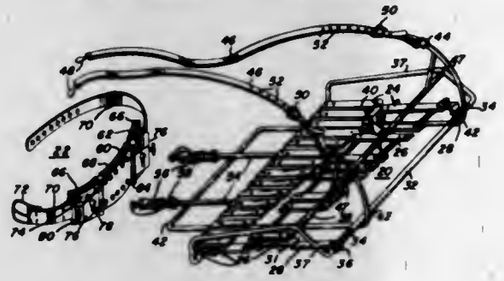
3,272,053
SHEAR-BLADE CONTROL MECHANISM
Georges Pollet, Saint-Chamond, France, assignor to Compagnie des Ateliers et Forges de la Loire, St. Chamond, Firminy, St. Etienne, Jacob-Holtzer
Filed Oct. 2, 1964, Ser. No. 401,125
Claims priority, application France, Oct. 11, 1963, 950,427, Patent 1,379,094
5 Claims. (Cl. 83—617)

1. A mechanism for controlling shears of the type comprising one fixed and one moving blade, the latter being subject to the action of a member which applies to it a force varying with its position, a rocker endowed with swinging motion, during which it rolls without slip on a rolling-contact track rigidly attached to the frame of the machine, thus constituting a lever, the ratio between the



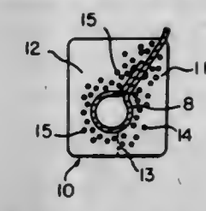
lever arms varying according to its position, the action of this lever controlling the travel of the moving blade according to a law determined by the shapes of the rolling-contact surfaces.

3,272,054
MUSICAL TOP
Robert Sefcik, Cherry Hill, N.J., assignor to J. Chein & Company, Burlington, N.J., a corporation of New York
Filed Mar. 6, 1964, Ser. No. 349,857
8 Claims. (Cl. 84—83)



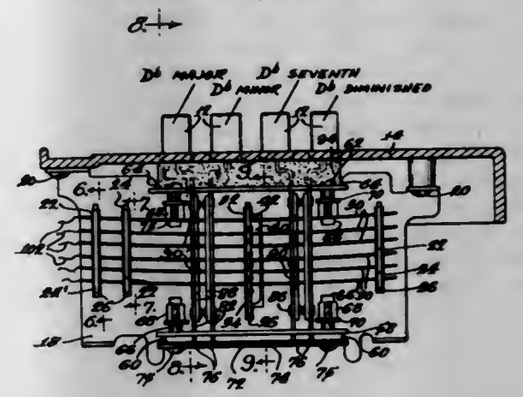
1. A sounding top comprising a support shaft, a casing rotatably mounted on said shaft, said shaft entering said casing, a top body larger than, mounted on and surmounting said casing for rotation therewith, a wall separating said casing from said body, said casing, said body, and said wall having openings formed therein to define a path for air flow serially through said casing, said wall and said body, a first gear fixed to and inside said casing and rotatable relative to said shaft, an arm in said casing fixed to said shaft, second and third rotationally connected gears carried by said arm, said second gear being meshingly operatively connected to said first gear, a reed-carrying member located in close juxtaposition to said wall and rotatable relative to said shaft and said wall so as to bring selected reeds into and out of registration with the opening in said wall, and a fourth gear in said casing, operatively connected to said member and meshingly operatively connected to said third gear, the relationship between the numbers of teeth in said gears being such as to cause said member to rotate relative to said shaft at a speed differing only slightly from the speed of rotation of said casing.

3,272,055
BOW STOP FOR STRINGED INSTRUMENTS
Theodore Henkle, 5415 Reynolds St., Savannah, Ga.
Filed July 19, 1965, Ser. No. 472,943
6 Claims. (Cl. 84—283)



1. A stop for a bow for a violin and the like to limit the length of the stroke of the bow and comprising a generally U-shaped clip having a constricted section at the base of the U to receive the bow stick in substantially non-sliding relation and provided with legs extending downwardly from such constricted section between which the hair of the bow is received, the terminals of the legs acting as a stop when they contact the strings of said violin.

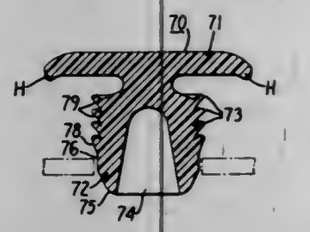
3,272,056
GLOCKENSPIEL AND SUPPORT THEREFOR
Herman R. Dean, Box 816, Port St. Joe, Fla.
Filed Dec. 31, 1964, Ser. No. 422,781
10 Claims. (Cl. 84—403)



1. A support for tone bar assemblies of a musical instrument of the percussion type comprising two elongated tone bar assembly support frames, said frames each having two longitudinally extending slots extending in the direction of elongation, two elongated frame members, two longitudinally extending end-located slots in said frame members, means for engaging said frame slots for removably securing said support frames to said frame members to form a substantially rectangular configuration, two support members connected to one of said frame members, two hinges connected at ends of said support members for providing rotation in a vertical plane, two insert buttons connected to said hinges, a body encircling belt having three rigid plate sections, slotted plate means secured to said rigid plate sections, said slotted plate means containing two slots for engaging said insert buttons, two shoulder straps, means connected to two of said plate sections for securing ends of said straps, and means connected to said frame members for securing ends of said straps.

3,272,057
DRUM HEAD AND METHOD OF ITS MANUFACTURE
Yukio Saito, 9 Karasuyama-machi, Nasu-gun, Tochigi-ken, Japan
Filed Oct. 19, 1965, Ser. No. 497,868
6 Claims. (Cl. 84—414)

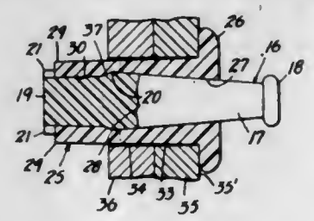
1. A drum head which comprises a vibratile diaphragm sheet and a supporting ring member securing the periphery of the said sheet, characterised in that the edge of the said sheet extends downwardly from the periphery, turns outwardly and upwardly, and its end is secured to the lower part of the periphery of the sheet to thereby form an annular void, a rigid annular member, if desired, being inserted into the said annular void, and that an inside and an outside ring-like member composed of a resin-impregnated continuous glass filaments wound in layer are solidified with the edge of the said sheet disposed between them and made into an integral supporting ring.



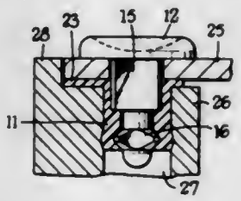
3,272,058
ORGAN CHORD SWITCH
Lyman J. Haviland, Mundelein, Ill., assignor to Hammond Organ Company, Chicago, Ill., a corporation of Delaware
Filed July 20, 1964, Ser. No. 383,725
5 Claims. (Cl. 84—443)

1. For use in an electrical musical instrument including tone signal generators for generating collectively electrical tone signals corresponding to the twelve tones of the even tempered scale, and an output system including electroacoustical translating means, a multiple contact switch comprising a plurality of spaced spring contact members arranged in a stack, said contact members being adapted to be connected respectively to different ones of said tone signal generators, said contact members being supported adjacent their ends on insulating supports, an insulating support plate disposed vertically substantially in the center of said stack and transversely thereof, said support plate having apertures therein for passage of said contact members, a stack of spaced bus bars supported by said support plate, said bus bars corresponding in number to the number of said contact members, said bus bars being adapted to be connected to said electroacoustical translating means, said bus bars being disposed respectively adjacent said contact members and spaced therefrom, at least one manually operable switch actuating member disposed on each side of said stack of bus bars and near the center of said stack of contact members relative to the supports

of the latter for selectively moving different combinations of said contact members into engagement with their respective bus bars, said actuating members on one side of said stack of bus bars being substantially the same distance therefrom as the corresponding actuating members on the opposite side thereof, whereby such different combinations of said contact members may be engaged with their respective bus bars upon movement selectively of said actuating members through substantially equal distances.



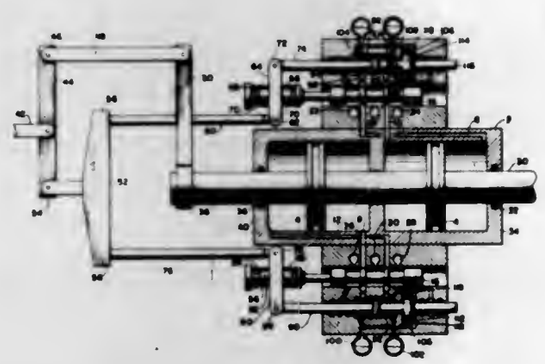
3,272,059
PLASTIC HOLLOW-ENDED FASTENER
Richard W. Lyday, Brookville, and Cletus L. Moorman, Trotwood, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Original application June 22, 1961, Ser. No. 118,836. Divided and this application May 15, 1964, Ser. No. 367,848
1 Claim. (Cl. 85—5)



A unitary fastening device for elastomeric sealing strip cavity and mounting panel aperture installation, consisting of a body of plastic material having an elongated and substantially oblong head portion having integral hook-like opposite ends remote from each other at predetermined locations, a stem portion solid immediately adjacent to and integral axially at one end thereof with a central location of said elongated oblong head portion and having the lateral width of said stem portion less than that of said elongated oblong head portion, and a substantially annular enlarged extension of said stem portion including collectively an exterior initial tapered portion adjacent the end thereof remote from said elongated head portion, a secondary tapered portion extending radially outwardly further than said initial tapered portion, an intermediate cylindrical outer portion interconnecting said initial tapered portion and said secondary tapered portion, plural concentric barb-like rings axially spaced along said enlarged extension adjacent said solid stem portion with said secondary tapered portion defining the outer surface of the lowermost of said barb-like rings, and a hollow interior extending axially from said end thereof that is remote from said elongated oblong head portion and that enhances resilience and facilitates flexing of said exterior initial tapered portion which is a guide for entry into a mounting panel aperture as well as said intermediate cylindrical outer portion, each of said concentric barb-like rings being interconnected by an arcuate flared portion collectively all having a diameter greater than the lateral width of said central location of said elongated oblong head portion though the diameter thereof is specifically less than the longitudinal distance between predetermined locations of said hook-like opposite ends of said elongated oblong head portion.

3,272,060
PLASTIC BLIND RIVET
Louis H. Morin, Bronx, N.Y.
(125 Beechwood Ave., New Rochelle, N.Y.)
Filed Apr. 24, 1964, Ser. No. 362,231
2 Claims. (Cl. 85—77)

1. A blind rivet comprising assembled stud and body parts, each part having a head at one common end of said parts, the head of the stud part always projecting beyond the head of the body part, the stud part including a tapered shank of decreasing diameter toward its head, said shank having a coaxially disposed large diameter annular shoulder at its inner end, a slightly tapered leading end portion at the inner end portion of the stud part and radially projecting ribs on said slightly tapered leading end portion for keying the body part against rotation on the stud part, the body part including an internally tapered tubular portion normally snugly engaging said tapered shank, and the body part intermediate said keying means having circumferentially spaced anchor wing portions normally lying within the outside diameter of said tubular portion said ribs comprising circumferentially spaced longitudinal extending elements projecting through said body part between said spaced wing portions, said wings including at their inner end portions internal shoulders normally abutting the annular shoulder of said shank, said ribs extending axially toward the head from the terminus of the inner end of the stud to beyond the annular shoulder of said shank, said ribs being tapered from a portion of greatest circumferential extent adjacent said terminus toward said head, the adjacent abutting surfaces of said wing portions having a corresponding degree of taper conforming to the taper of said ribs and said slightly tapered leading end portion.



3,272,061
FASTENERS
Clifford Alexander Seckerson, Iver Heath, England, assignor to United-Carr Incorporated, Boston, Mass., a corporation of Delaware
Filed Apr. 2, 1965, Ser. No. 445,108
Claims priority, application Great Britain, May 7, 1964, 19,067/64
4 Claims. (Cl. 85—82)

1. A fastener for attaching an apertured panel to a recessed support and comprising a stud and a socket, the socket comprising a tubular sleeve adapted for close-fitting insertion in the recessed support and, at one end of the sleeve a circumferential flange adapted to seat on the recessed support, the sleeve comprising an inner portion adjacent the flange, the internal cross-section of which is approximately circular and an outer portion the internal cross-section of which is approximately rectangular and includes two facing substantially flat walls, the stud having a head and a shank for insertion into the sleeve of the socket, the shank having an inner portion adjacent the head and adapted for rotation within the inner portion of the sleeve, two diametrically opposed lugs and a neck portion of reduced cross-section relative to the inner portion joining the lugs to the inner portion, the lugs being adapted to pass easily into the outer portion of the sleeve when the stud is in one angular position relative to the socket and being adapted to bite into the

said walls of the outer portion of the sleeve and expand the said outer portion when the stud is rotated relative to the socket away from the said angular position.

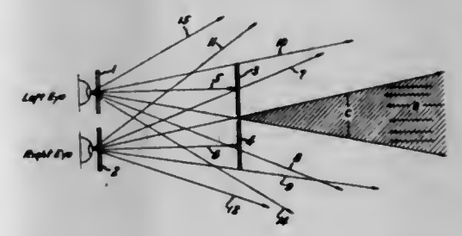
SERVO VALVE SYNCHRONIZER
Robert V. Flippo, Dallas, and Lloyd H. Holmes, Arlington, Tex., assignors, by mesne assignments, to LTV Electrosystems, Inc., Greenville, Tex., a corporation of Delaware
Filed Oct. 7, 1965, Ser. No. 493,697
3 Claims. (Cl. 91—384)

2. A hydraulic actuator comprising:
a cylinder,
a piston slideable within said cylinder,
a piston rod carried by said piston and projecting through the ends of said cylinder,
a source of pressurized fluid,
a plurality of servo valves connected in hydraulically parallel circuits to regulate the flow of pressurized fluid between said source and said cylinder to control movement of said piston,
a control arm movable to apply command signals to said actuator,
a first rocker arm pivotally mounted on said control arm,
a second rocker arm pivotally mounted on one end of said first rocker arm,
link means connecting said piston rod to the opposite end of said first rocker arm,
a plurality of synchronizing pistons each connected to be actuated by fluid passed by a respective one of said servo valves,
a plurality of linkage means each connecting a respective one of said synchronizing pistons to a respective end of said second rocker arm, and
means carried by each of said linkage means for controlling the respective one of said servo valves associated therewith in response to movement of said control arm.

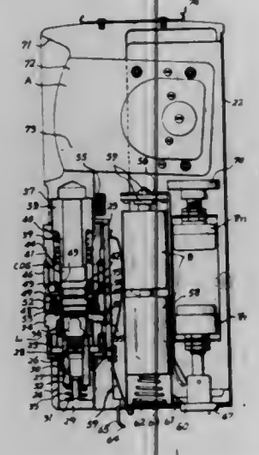


3,272,063
COMPOSITE SUPPORTED FIBER OPTIC STRIP
Joseph Singer, Jr., Arlington Heights, Ill., assignor to Chicago Aerial Industries, Inc., Barrington, Ill., a corporation of Delaware
Filed Aug. 13, 1962, Ser. No. 216,646
3 Claims. (Cl. 88—1)

1. In a fiber optical device, the combination comprising a plurality of radiation conducting optical fibers arranged to form a plurality of radiation conducting strips each having a width w and thickness t, said optical fibers in each of said strips being arranged tangent one another and with their axes mutually parallel and coplanar and the fibers of each strip fixed with respect to each other, two strip support members for each of said plurality of radiation conducting strips, said two strip support members for each radiation conducting strip being arranged parallel to the axes of said optical fibers thereof and abutting and fixed thereto to form a plurality of supported strips, one from each of said plurality of said radiation conducting strips, said plurality of supported strips being arranged contiguous

one another in side by side relationship and with their conducting fibers aligned and abutting to form a multiple strip assembly whose overall width is the sum of the widths w of said radiation conducting strips and where the thickness of the conducting fibers of said multiple strip assembly is t and the ratio $w:t$ is in excess of 20:1, and two multiple strip support members arranged parallel to each other and abutting and fused to said multiple strip assembly.

3,272,064
LIGHT ATTENUATING OPTICAL DEVICE FOR VEHICLES
Joseph W. Hyndman, Denver, Colo., assignor to C. W. MacMillan, Rock Island, Ill.
Filed Sept. 23, 1965, Ser. No. 495,753
3 Claims. (Cl. 88—1)

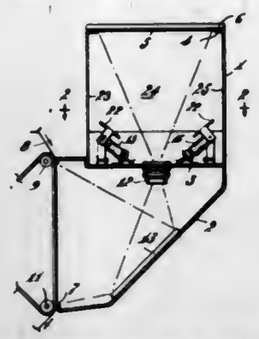


1. An optical device to be used by an operator of a vehicle for visual observation of lighted areas and to reduce glare from bright lights, comprising a first pair of spaced polarizing elements in optical alignment including a first eye piece element and a first filter element, and a second pair of spaced polarizing elements in optical alignment including a second eye piece element and a second filter element, each of said first pair of elements having its axes of polarization perpendicular to that of the other, each of said second pair of elements having its axes of polarization perpendicular to that of the other, and each of said eye piece elements having its axis of polarization perpendicular to that of the other, said first and second eye piece elements being positioned adjacent to the eyes of said operator, and said first and second filter elements being attached to said vehicle in the line of vision of said operator, whereby the vision of said operator when looking directly ahead through said first and second pairs of spaced polarizing elements is obstructed and the peripheral vision of said operator encompassing the region to either side of said filter elements is unobstructed.

3,272,065
OIL TESTER

Jinichi Ito and Shozo Shibuya, Tokyo, Japan, and Toyoo Yamada, 137 Kirisato-cho, Ota-ku, Tokyo, Japan; said Ito and said Shibuya assignors to said Yamada

Filed Jan. 8, 1963, Ser. No. 250,118
Claims priority, application Japan, Feb. 1, 1962, 37/3,625; Feb. 5, 1962, 37/5,184; Feb. 6, 1962, 37/4,582; Apr. 19, 1962, 37/16,207; June 7, 1962, 37/23,556; June 27, 1962, 37/26,861
2 Claims. (Cl. 88—14)



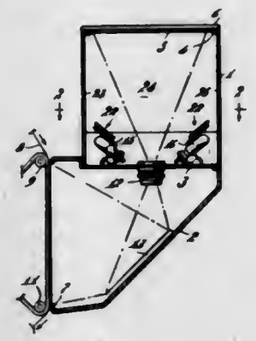
1. A portable oil tester comprising: an adjustable bridge circuit having a first pair of terminals and a second pair of terminals and including a photoconductive cell element as one leg thereof; voltage supply means coupled across said first pair of terminals; a current sensitive device including an indicator coupled across said second pair of terminals; housing means for enclosing the above-recited apparatus including a frame member, an aperture in one wall thereof with said current sensitive device mounted thereat to provide for viewing said indicator; a supporting cylinder secured to one side portion of said frame member; means for mounting said photoconductive cell element therein; an upper shadow cylinder threadably engaged with said supporting cylinder and adapted to be moved in an axial direction by rotation thereof; a lamp holding cylinder secured to said frame member in an axial alignment with said supporting cylinder; a light source located within said lamp holding cylinder; electrical means for energizing said light source; a lower shadow cylinder threadably engaged with said lamp holding cylinder and being axially movable by rotation thereof; a specimen stand being pivotally attached to said frame member and being located between said upper and lower shadow cylinders to pivot into axial alignment with said upper and lower shadow cylinders into a test position and being pivotally movable outwardly in a substantially horizontal position for receiving a test specimen, the specimen when in said test position being in axial alignment with said photoconductive cell element and said light source and intersecting the light transmitted from said light source to said photoconductive cell element so as to make the bridge circuit responsive to the light transmission factor of the test specimen thereby providing a qualitative measurement of said specimen.

3,272,066
COPYING APPARATUS

Richard E. Rice, Arlington, Mass., assignor to Comstock & Wescott, Inc., Cambridge, Mass., a corporation of Massachusetts

Filed Mar. 8, 1963, Ser. No. 263,939
5 Claims. (Cl. 88—24)

1. A printer having a record window to receive a record, a print window to receive a sheet of photographic material, a lens between the two windows to focus the record on said sheet, a chamber enclosing the space between the lens and record window, and light-producing means in said chamber, and reflector means disposed ad-



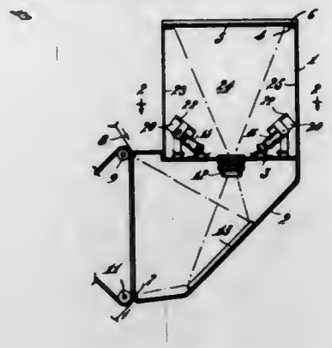
jacent the light-producing means to reflect light away from said lens and shaped to reflect light from said light-producing means to said record window with increasing intensity outwardly from the center of the record window.

3,272,067
COPYING APPARATUS

Kenneth John White, Framingham, Mass., assignor to Dennison Manufacturing Company, Framingham, Mass., a corporation of Nevada

Filed Jan. 31, 1964, Ser. No. 341,616
1 Claim. (Cl. 88—24)

For printing a sheet of photographic material from a record sheet, a printer comprising a chamber having a record window to receive a record sheet, a print window to receive a sheet of photographic material, a lens between the two windows to focus the record sheet on the photographic sheet, said chamber and windows having corresponding rectangular shapes, means for illuminating the record sheet including light sources in said chamber opposite the record window, a reflector behind each light source, each reflector being directed toward an opposite side of said chamber adjacent the record window, sides of said chamber being reflective, a baffle in front of each light source to shield an area including said record window, each baffle comprising superposed parts and means to adjust one part relatively to the other part so that it projects more or less beyond an edge of the other part, the adjustable part being polygonal and eccentrically mounted on the other part so that, in different angular positions, different edges project different distances beyond said edge of the other part, and means to adjust the baffles to vary said areas.



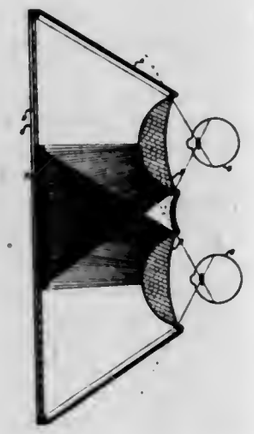
3,272,068
COPYING APPARATUS

Paul H. Couture, Shrewsbury, Mass., assignor to Dennison Manufacturing Company, Framingham, Mass., a corporation of Nevada.

Filed Sept. 4, 1964, Ser. No. 394,574
1 Claim. (Cl. 88—24)

For printing a sheet of photographic material from a record sheet, a printer comprising a chamber having a

record window to receive a record sheet, a print window to receive a sheet of photographic material, a lens between the two windows to focus the record sheet on the photographic sheet, said chamber and windows having corresponding rectangular shapes, means for illuminating the record sheet including a light source in each of the four corners of said chamber opposite the record window,

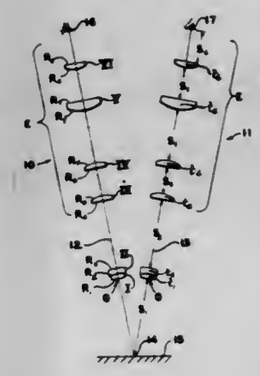


a baffle in front of each light source to prevent light from being reflected directly from the record window to the lens, the sides of said chamber being reflective, and a reflector behind each light source, each reflector being directed toward an opposite side of said chamber adjacent the record window, characterized in that each baffle has a wing on the side next to the adjacent wall of said chamber to screen each lamp from its adjacent wall.

3,272,069
APPARATUS FOR VIEWING WIDE-ANGLE STEREOSCOPIC PICTURES

Harvey L. Ratliff, Jr., Lubbock, Tex., assignor to Jetru Inc., Amarillo, Tex.

Filed Apr. 1, 1965, Ser. No. 447,600
4 Claims. (Cl. 88—29)



1. A wide angle stereoscopic viewing device comprising: an enclosed hollow casing; two positive wide angle oculars, supported by said casing having relatively short focal lengths and having their axes substantially parallel and spaced by the normal spacing of a viewer's eyes and having diameters greater than approximately 20 millimeters in the dimensions perpendicular to their axes and parallel to a line joining a viewer's eyes; a single composite picture supported at the focal plane of said oculars in a position to be viewed through said oculars, said picture consisting of respective right and left eye views that are overlapped in a central portion of the composite picture, the central overlapped portions of the respective views are made up of a multiplicity of vertical strip images that are interlaced so that adjacent strips are respectively strip images of the right and left eye view; means coacting with said picture to separate the strip images in the central portion of said picture into the respective right and left eye views as seen through said oculars,

whereby the overlapping of the views only in the central portion of the composite picture eliminates the viewing of a dividing line between the left and right eye views.

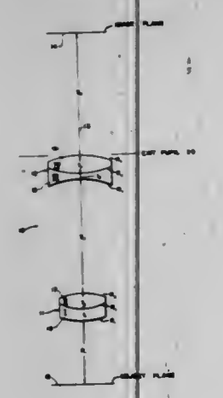
3,272,070
OPTICAL SYSTEM FOR STEREOMICROSCOPE

James R. Benford, Irondequoit, N.Y., assignor to Bausch & Lomb Incorporated, Rochester, N.Y., a corporation of New York

Filed Jan. 18, 1963, Ser. No. 252,459
2 Claims. (Cl. 88—57)

1. A pair of optical systems focused on an area of a specimen to form stereo images at substantially 15× magnification thereof, each of said systems having the combination of a compound objective lens and an erecting type of eyepiece aligned rearwardly thereof, said eyepiece consisting of four plano-convex singlet lenses optically aligned with said objective lens, the plano surfaces of the foremost two singlets facing forwardly and the plano surfaces of the two rearmost lenses facing rearwardly, the optical parameters of each of said systems being given in the table of mathematical statements herebelow wherein the front and rear elements of the compound objective lens are designated I and II respectively and the successive singlet lenses are numbered III, IV, V and VI, the focal lengths of lens parts I to VI being designated F_I to F_{VI}, and the minus (—) sign used with F_{II} denoting negative power, the radii of the successive lens surfaces being designated R_1 to R_{11} and the minus (—) sign used, therewith denoting those surfaces which have a center of curvature lying on the object side of the vertex of the surface, the axial thicknesses of the successive lenses being designated t_1 to t_6, the successive air spaces from the specimen to the eyepoint of the instrument being designated S_1 to S_6, and the refractive index and Abbe number of the glass in the aforesaid lens elements being represented by n_D and ν respectively, and F is the numerical sum of the focal lengths F_I to F_{IV},

$F_I = .1093F$	$R_{10} = .0814F$
$-F_{II} = .213F$	$R_{11} = \text{Plano}$
$F_{III} = .1625F$	$t_1 = .0224F$
$F_{IV} = .1625F$	$t_2 = .01478F$
$F_V = .1880F$	$t_3 = .01478F$
$F_{VI} = .1625F$	$t_4 = .01478F$
$R_1 = .233F$	$t_5 = .02059F$
$-R_2 = .0723F$	$t_6 = .01478F$
$-R_3 = .1482F$	$S_1 = .502F$
$R_4 = \text{Plano}$	$S_2 = .462F$
$-R_5 = .0856F$	$S_3 = .182F$
$R_6 = \text{Plano}$	$S_4 = .347F$
$-R_7 = .0856F$	$S_5 = .2138F$
$R_8 = .1168F$	$S_6 = .0729F$
$R_9 = \text{Plano}$	



the refractive index and Abbe number being designated n_D and ν respectively for the successive lens elements I to VI, the numerical values thereof being given in the table herebelow,

Lens	n_D	ν
I	1.517	64.5
II	1.720	29.3
III	1.524	59.5
IV	1.524	59.5
V	1.621	36.2
VI	1.524	59.5

3,272,071
MICROSCOPE OBJECTIVE HAVING TWO DOUBLETS

George F. Ziegler, Gates, N.Y., assignor to Bausch & Lomb Incorporated, Rochester, N.Y., a corporation of New York

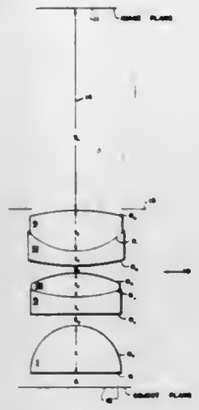
Filed June 14, 1963, Ser. No. 288,035
4 Claims. (Cl. 88—57)

1. An objective for microscopes and the like comprising a front doublet lens and a rear doublet lens axially aligned therewith and spaced therefrom so as to form an image of an object surface and additionally form an exit pupil substantially in the plane of the rear vertex of the rearmost lens,

said front doublet lens consisting of a front negative meniscus lens element I which is in contact with a rear doublet convex lens element II,

said rear doublet lens consisting of a double concave lens element III which is in contact with a rear double convex lens element IV,

the values of focal lengths of the successive lens elements I to IV, the values of the successive lens thicknesses t_1 to t_4, the values of the successive air spaces S_1 to S_3 between the object and image, as well as the refractive indices n_D and Abbe number ν having the numerical values stated in the table herebelow,



$.675F<-F_I<.745F$	$9.710F<S_3<10.730F$
$.412F<F_{II}<.454F$	$.0772F<t_1<.0852F$
$1.021F<-F_{III}<1.127F$	$.1543F<t_2<.1705F$
$.707F<F_{IV}<.781F$	$.0962F<t_3<.1062F$
$.421F<S_1<.465F$	$.1780F<t_4<.1980F$
$.744F<S_2<.822F$	

$1.619<n_D(I)<1.623$
$1.521<n_D(II)<1.525$
$1.619<n_D(III)<1.623$
$1.521<n_D(IV)<1.525$ absolute
$34.0<\nu(I)<38.0$ values
$56.0<\nu(II)<60.0$
$34.0<\nu(III)<38.0$
$56.0<\nu(IV)<60.0$

3,272,072
THREE MEMBER MICROSCOPE OBJECTIVE

George F. Ziegler, Gates, N.Y., assignor to Bausch & Lomb Incorporated, Rochester, N.Y., a corporation of New York

Filed June 17, 1963, Ser. No. 288,366
2 Claims. (Cl. 88—57)

1. An achromatic objective for a microscope and the like having a magnification of substantially 30× and a minimum aperture of substantially 0.65, said objective forming an image of an object surface, the image being well corrected for spherical and chromatic aberrations, coma, and astigmatism, said objective furthermore forming an exit pupil substantially in the plane of the vertex of the rearmost lens surface of said objective, said objective being composed of

a front singlet lens member, and

a second and a third lens member which are compound,

said members all being optically aligned with and spaced from each other,

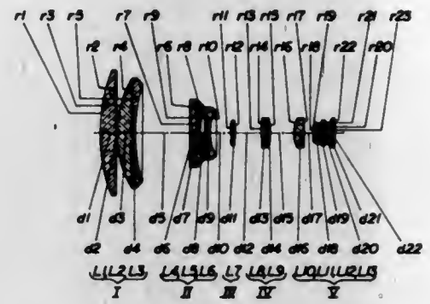
said front lens member being nominally a plano-convex form designated I,

said second lens member being composed of a front plano-concave lens element II and a double convex lens element III, and

said third lens member being formed of a front negative meniscus lens element IV which lies in contact with a rear double convex lens element V,

the values of the radii R_1 to R_8 of the successive lens surfaces, the values of the axial thicknesses t_1 to t_5 of the successive lens elements I to V, the values for the airspaces S_1 to S_4 between said object surface and said image being given in the table of mathematical statements herebelow wherein the minus (—) signs used with the R values applies to those lens surfaces whose centers of curvature lie on the entrant side of the vertex of said surfaces, and F denotes the equivalent focal length of said objective,

R_1=Plano	t_2=.250F
$-R_2$=.716F	t_3=.375F
R_3= Plano	t_4=.250F
R_4=2.085F	t_5=.639F
$-R_5$=1.580F	S_1=.167F
R_6=3.545F	S_2=.167F
R_7=1.052F	S_3=.0952F
$-R_8$=2.900F	S_4=30.15F
t_1=.757F	



the absolute values for the refractive index n_D and Abbe number ν for the successive lens elements I to V being given in the table of mathematical statements herebelow,

$n_D(I)$=1.573	$\nu(I)$=57.4
$n_D(II)$=1.617	$\nu(II)$=36.6
$n_D(III)$=1.573	$\nu(III)$=57.4
$n_D(IV)$=1.720	$\nu(IV)$=29.3
$n_D(V)$=1.511	$\nu(V)$=63.5

3,272,073
HIGH-SPEED PHOTOGRAPHIC OR CINEMATOGRAPHIC VARIFOCAL OBJECTIVE

Günter Klemt and Karl Macher, both of Bad Kreuznach, Germany, assignors to Jos. Schneider & Co., Optische Werke, Bad Kreuznach, Germany, a corporation of Germany

Filed Dec. 23, 1964, Ser. No. 420,727
Claims priority, application Germany, Feb. 17, 1959, Sch 25,529; Aug. 5, 1960, Sch 28,268
6 Claims. (Cl. 88—57)

1. An optical objective system comprising a principal objective and an afocal attachment in front of said principal objective; said attachment consisting of four components separated from one another by variable air spaces, said components including a fixed front component of positive refractivity, a first intermediate component of negative refractivity, a second intermediate component of negative refractivity and a fixed rear component of positive refractivity, said first and second intermediate components being movable, relatively to each other and to said front and rear components, into a first position in which the system has a relatively small focal length and a second position in which the system has a relatively large focal length; said rear component having a focal length equal to at most 75% of the focal length of said front component; said front component having a focal length less than four times the focal length of said principal objective; said first intermediate component consisting of two closely juxtaposed lens members of negative refractivity separated by an air space of negative configuration, said lens members being of substantially planoconcave shape with concave rear surfaces and including a singlet preceded by a doublet with a forwardly concave collective cemented surface, said singlet and said doublet each having a concave rear surface, the rear surface of said singlet being more strongly curved than that of said doublet; said principal objective consisting of four air-spaced lens members including a positive first member, a negative second member, a positive third member and a positive fourth member, said fourth member being a biconvex lens with front and rear surfaces respectively having a shorter and a longer radius of curvature with an absolute ratio less than 1:3.

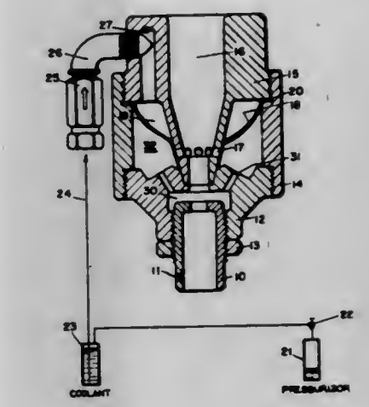
3,272,074
MUZZLE FLASH SUPPRESSOR

Neal L. Vinson, 836 Arizona SE., Albuquerque, N. Mex.

Filed Mar. 26, 1965, Ser. No. 443,135
4 Claims. (Cl. 89—14)

1. A device for suppressing the muzzle flash of a firearm, comprising:

means fitting over the end of the firearm muzzle for conducting combustion gases following a fired bullet;



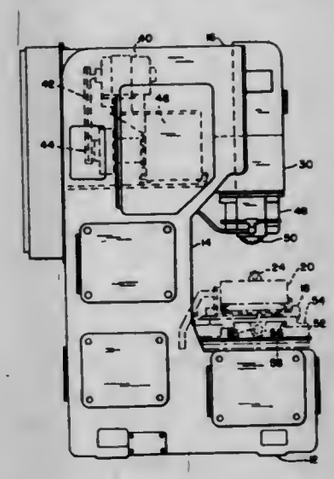
a rearwardly perforated mixing cone supported in line with said conducting means;

a stretchable diaphragm tightly covering the outside of the perforated portion of the mixing cone and extending away from the remainder thereof, forming a first chamber;

a relatively noncompressible pressurized liquid coolant having a boiling point not greater than the temperature of the combustion gases;

unidirectional means for conducting the coolant into the first chamber;

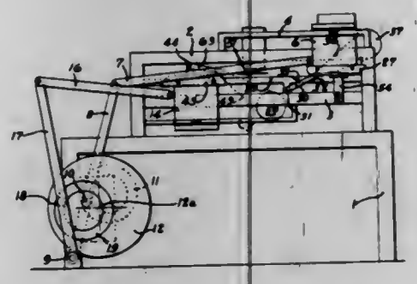
means forming a second chamber around the outside of the diaphragm;



and means for admitting combustion gases from the conducting means into the second chamber whereby the diaphragm is stretched and the coolant is forced through the perforations into the mixing cone where it mixes with combustion gases, cooling them below the temperature of luminosity.

3,272,075
GEAR FINISHING MACHINE

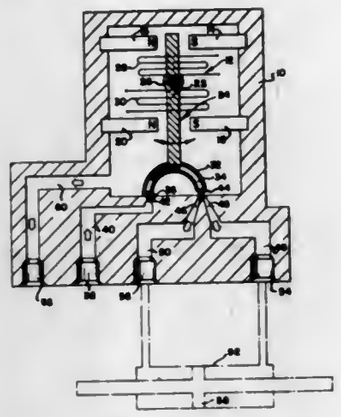
Thomas S. Gates, Grosse Pointe Woods, Kenneth J. Davis, Grosse Pointe, and Arthur B. Bassoff, Oak Park, Mich., assignors to National Broach & Machine Company, Detroit, Mich., a corporation of Michigan



Filed Dec. 14, 1964, Ser. No. 417,946
15 Claims. (Cl. 90—1.6)

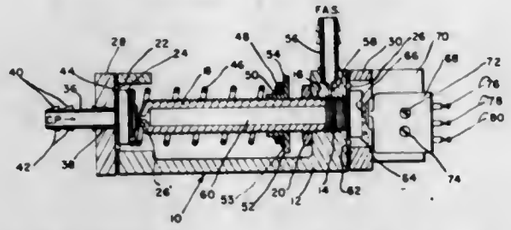
1. A gear finishing machine comprising a frame, a first rotary support on said frame for mounting a gear-like member for rotation about its axis, means for angularly adjusting said first support about an axis perpendicular to and intersecting the axis of rotation of said first support, a rocking table on said frame movable bodily thereon in rectilinear reciprocation in any direction in a plane perpendicular to the axis of adjustment of said first rotary support, a second rotary support on said table having its axis of rotation in intermediate position of said table perpendicular and intersecting the axis of adjustment of said first rotary support, the rocking axis of said table being parallel to a plane which is parallel to the axes of

rotation of both of said rotary supports, and perpendicular to the axis of rotation of said second rotary support, a first member rigid with said frame, a second member rigid with said table, cam and cam follower devices connected between said members, said cam device comprising an angularly adjustable body having parallel planar camming surfaces and being mounted on one of said members, said follower device comprising follower means movable longitudinally of the planar surfaces of said cam device, means on said cam device preventing relative separation movement between said means and said body in a direction parallel to the rocking axis of said table, an elongated pin connected to one of said devices, an elongated guide sleeve on one of said members in which said pin is longitudinally slidable, and a self-aligning bearing connecting said pin to said follower means.



3,272,076
MACHINE FOR CUTTING SPECTACLE-LEGS OR THE LIKE
Michel Carrier, 31 Rue Pasteur, Oyonnax, France
Filed Mar. 2, 1965, Ser. No. 436,568
Claims priority, application France, Mar. 9, 1964, 44,560, Patent 1,396,560
5 Claims. (Cl. 90—13)

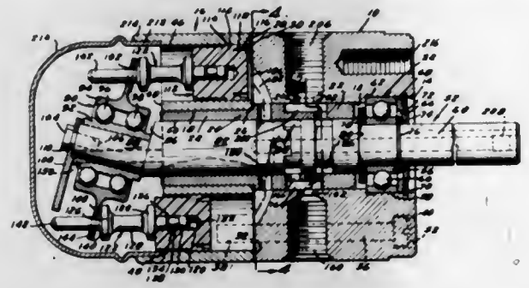
1. In a machine for cutting spectacle-legs or the like from a plastics plate, said machine having a stationary frame, the combination of: a first vice slidably mounted on the machine frame and gripping said plate, the protruding portion of which is displaced along a first milling-cutter having its axis moved transversely with respect to said plate by means of a first gauge-and-feeler mechanism in order to cut on said plate protruding portion the first half of the desired profile, a second vice adapted to automatically grip said plate protruding portion automatically removed from said first vice, and to displace it in a longitudinal movement along a second milling-cutter having its axis moved transversely with respect to said plate protruding portion by means of a second gauge-and-feeler mechanism in order to cut on said plate protruding portion the second half of the desired profile; means to reciprocate said first and second vice in synchronous motions; and actuating means to lock and open automatically said first and second vice at predetermined positions.



3,272,077
HYDRAULIC SERVO VALVE
John W. Meulendyk and Robert F. Boyle, Kalamazoo, Mich., assignors to Pneumo Dynamics Corporation, Cleveland, Ohio, a corporation of Delaware
Filed Dec. 23, 1963, Ser. No. 332,820
6 Claims. (Cl. 91—3)

1. A fluid servo valve comprising a valve housing, fluid inlet means for supplying fluid to the interior of said housing, a plurality of fluid receiving passages in said housing, said receiving passages being adapted to communicate with an external mechanism operated by said fluid, fluid transfer means movably mounted in said housing with an end thereof adapted to receive fluid from said inlet means and direct such fluid to said receiving passages, control means for positioning said transfer means to proportion the fluid flow into said receiving passages, said end of said transfer means being formed with a curved fluid passage

the respective ends of which are closely spaced from and communicate respectively with said inlet means and said receiving passages.

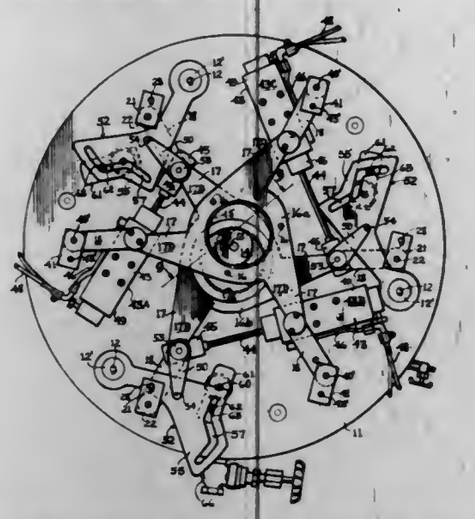


3,272,078
CONTROLLING APPARATUS
Robert S. Wilks, Philadelphia, Pa., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed Oct. 12, 1964, Ser. No. 402,999
2 Claims. (Cl. 91—47)

1. A fluid amplifier, comprising a fluid supply conduit, a second conduit, a restricted passageway extending between the conduits, a nozzle forming one end of the second conduit for bleeding a fluid flowing from the fluid supply conduit to atmospheric pressure, a distensible member, a plate mounted on the distensible member for respective movement therewith toward and away from the nozzle and upon the application of an increase and decrease of the magnitude of an input fluid pressure signal to another opposite surface of the distensible member, the non-bleed end of the second conduit being sealed off by means of a second distensible member, the second distensible member being employed to convert changes in the magnitude of the fluid pressure occurring in the second conduit into a mechanical motion, an adjustable means threadedly connected to the external surface of the second conduit for longitudinal movement therealong, and an adjustable biasing means is positioned to extend between the plate and the adjustable means to apply a different preselected spring load force to the plate and the first distensible member associated therewith for each different position of the adjustable means on the external surface of the second conduit.

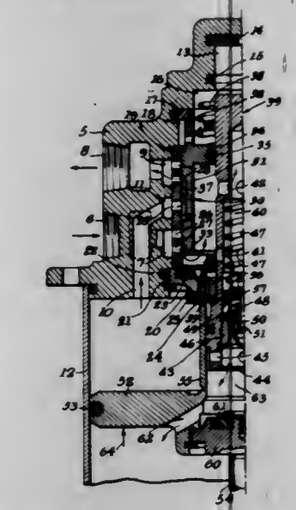
3,272,079
FLUID PRESSURE OPERATED MOTOR
John H. Bent, Fullerton, Calif., assignor to Standard Pneumatic Motor Company, Whittier, Calif., a corporation of California
Filed Dec. 16, 1963, Ser. No. 330,845
12 Claims. (Cl. 91—175)

1. A pneumatic motor, comprising:
(A) a body having an axial bore therethrough, a pair of diametrically opposed tapped bores in said body communicating with the axial bore thereof, and a plurality of radially arranged slots at the rear of the extending from the axial bore thereof;
(B) a head secured to the rear end of the body, said head having an axial bore therethrough aligned with the axial bore of the body, and a plurality of annularly arranged and spaced cylinders extending longitudinally through the head and spaced equal distances from the axis of the head;
(C) a sealing gasket between the adjacent ends of the body and head, said gaskets having openings therethrough in register with the forward ends of the respective cylinders;
(D) a bushing operably secured in a rear portion of the axial bore in the body and in the axial bore of the head, said bushing having an axial bore therethrough coaxial with the bores of the body and head, a plurality of radial passages connecting the interior of the bushing bore with the respective slots at the end of the body, and a pair of external recesses at diametrically opposite sides thereof, one of said recesses having its rearward end connected with the axial bore of the bushing and the other of said recesses having its forward end connected with the axial bore of said bushing, the tapped bores in the body being connected with the respective recesses;
(E) a motor shaft operably disposed within the axial bore of the bushing and having a part extending forwardly of the forward end of the body, said



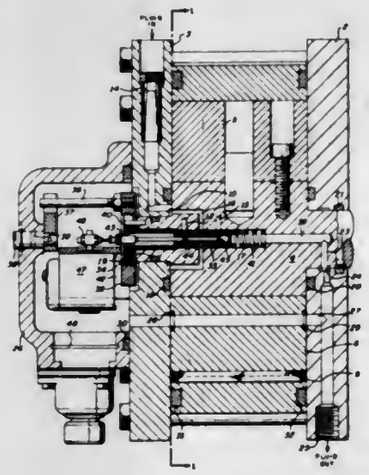
shaft having a longitudinally extending bore therein closed at both ends, a first annular groove communicating with the recess having its forward end connected with the bore of the bushing, said shaft having a second annular groove communicating with the recess having its rear end connected with the bore of said bushing said second annular groove being spaced rearwardly of the first annular groove and separated therefrom by an annular flange forming part of the shaft, said shaft having relieved portions at diametrically opposite sides with a generally wedge-shaped part of the shaft therebetween, said recesses being adapted to be connected with the radial passages of the bushing to successively supply fluid to said cylinders with rotation of the motor shaft, there being pressure fluid supplied to a plurality of cylinders at a time, the other of said recesses being adapted to be connected with cylinders for exhaust fluid, said shaft having a cross-bore connecting the second recess with the longitudinally extending bore of the shaft, whereby exhaust fluid is carried through said longitudinally extending shaft bore, into the recess connected with said longitudinal bore through the first mentioned cross-bore in the shaft, the rear end of said shaft extending rearwardly of the rear end of said bushing and being bevelled at inclination relative to a plane normal to the axis of the shaft, said bevelled end having a part spaced rearwardly of the diametrically opposite part, said shaft having a stub shaft integral with the rear end thereof and having an axis perpendicular to the rear bevelled end of said shaft, the axis of the stub shaft being offset from the axis of said motor shaft;
(F) a wobble plate assembly on said stub shaft, said wobble plate assembly including a ball bearing assembly having an inner race with an axial bore therethrough receiving the stub shaft, an outer race, and two sets of ball bearings operably positioned between the inner and outer races, said sets of ball bearings being in respective planes parallel to each other and spaced apart axially relative to said bearing assembly, and an annular flange integral with and extending about the outer race in a plane midway between the plane of the respective sets of balls, said flange comprising a wobble plate having a plurality of holes therethrough adjacent the periphery thereof, said holes being spaced equal distances from the axis of the stub shaft and being annularly spaced apart equal distances, and other holes between certain of the first mentioned holes in the wobble plate;
(G) means securing the wobble plate assembly on the stub shaft, said means including a counterbalancing weight having one end secured to the free end of said stub shaft and extending parallel to the wobble plate at one side of said stub shaft;
(H) a piston reciprocable in each of said cylinders, each piston being of a resilient plastic material having a cylindrical inner end portion engaging the walls of its cylinder and an annular groove extending from the inner end of the piston toward the outer end to thereby provide a relatively thin skirt which forms part of the cylindrical portion of the piston engaging the cylinder walls, each piston also having an axial bore extending from the rear end forwardly thereof but closed at the forward end;
(I) a piston rod having a portion disposed within the axial bore of the piston, a flange engaging the outer end of the piston, and an annular flange on said piston rod spaced rearwardly of the piston and having a frusto conical rear side, said piston rod having a rear end portion extending rearwardly from the smaller part of the frusto conical side and extending through one of the first mentioned holes in the wobble plate, said holes sufficiently larger than the portion of the piston rod extending therethrough to permit operable movements of said wobble plate;
(J) and a washer on the rearward end portion of the piston rod disposed between the frusto conical side of the flange on the piston rod and the adjacent side of the wobble plate, said washer serving as a bearing.

3,272,080
TORQUE DRIVE MECHANISM
Hazelton H. Avery, Clarks Hill, Ind., assignor of one-half to Rush Metal Products, Inc., Lafayette, Ind., a corporation of Indiana
Filed Sept. 20, 1963, Ser. No. 310,224
13 Claims. (Cl. 91—186)



1. A torque drive mechanism including a driven shaft,
(a) a plurality of shaft driving means each having formed therein a center circular opening through which said shaft projects,
(b) said shaft driving means being eccentrically positioned about said shaft with a peripheral sector of the center opening of each engaging opposite corresponding peripheral sectors of said shaft so as to form a drive coupling therebetween,
(c) each of said shaft driving means providing radial arms, with the arms of one of said shaft driving means extending in an opposite and tangential direction with respect to the radial arms of said other driving means,

(d) pivotal means connected to the free ends of said arms for directing said shaft driving means in a continuous circular path about said shaft while maintaining the coupling connection therebetween,
(e) means connected between and operable on said arms for driving said arms through a circular path

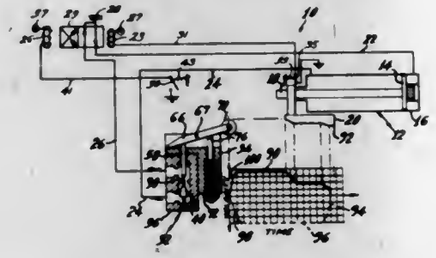


about their pivotal connecting means and said shaft driving means about said shaft,
(f) means for effecting the operation of said driving means, and
(g) means controlled by said last named means for operating said driving means.

3,272,081
AIR MOTOR
Borgert Vedder, Fullerton, Calif., and John Vedder, Torrance, Calif. (both of 14032 S. Avalon Blvd., Los Angeles, Calif. 90061)
Filed Jan. 4, 1965, Ser. No. 422,907
6 Claims. (Cl. 91—228)

1. An air motor comprising:
(a) a body with an air inlet and an air exhaust and having a bore and two sets of ports connecting said bore and the inlet and exhaust, respectively,
(b) an air cylinder extending from said body and open to said bore,
(c) the body having ports intermediate the mentioned two sets of ports and passage means from said intermediate ports to the portion of the cylinder adjacent the body,
(d) an air piston in said cylinder provided with a hollow stem operative in the body bore and having ports opening through the bottom thereof,
(e) a four-way valve sleeve movable in said bore between upper and lower positions with a spring to bias the sleeve to its lower position, said sleeve in one position providing communication between the air inlet and the body bore and between the air exhaust, through the passage means, and the upper portion of the air cylinder, and said sleeve in the other position providing communication between the air inlet and said passage means and upper portion of the air cylinder, and between the air exhaust and the body bore,
(f) a pilot valve having an axial bore and guided in said sleeve provided with a piston at one end, said pilot valve being shiftable by air pressure from the inlet entering the body bore, as controlled by the four-way valve sleeve,
(g) a check valve, carried by the pilot valve, that opens to air pressure in the bore thereof to provide operating pressure, through the ports in the air piston, on the under surface of the latter, and
(h) a second check valve carried by the pilot valve that opens in the opposite direction to pass pressure air from beneath the air piston into the body bore.

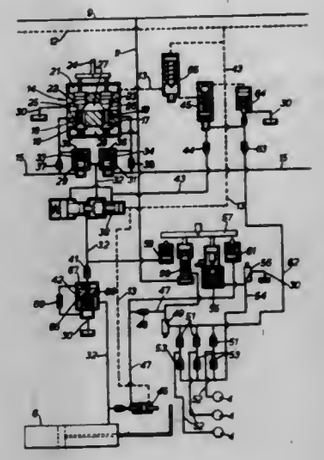
3,272,082
HYDRAULIC APPARATUS
Benjamin Quesenbury Bertram, Staines, and Ronald Walters, Wembley, England, assignors to The Sperry Gyroscope Company Limited, Brentford, England, a company of Great Britain
Filed Jan. 13, 1964, Ser. No. 337,327
Claims priority, application Great Britain, Jan. 16, 1963, 1,978/63
6 Claims. (Cl. 91—378)



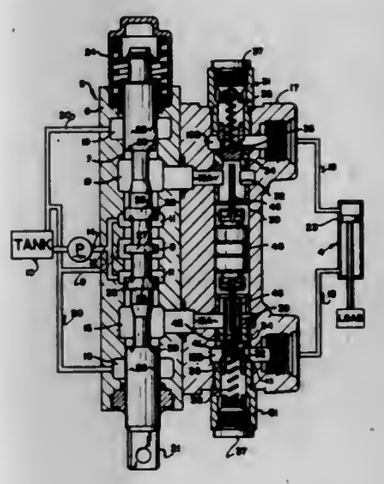
1. Apparatus utilizing an actuating fluid including a housing having differential fluid pressure chambers and a fluid outlet chamber, a shaft mounted in the housing to move about an axis having an axial cavity with an open end arranged in the housing in adjoining relation with the fluid outlet chamber, stop means between the housing and shaft for limiting the angular motion of the shaft about the axis, a piston structure extending from the shaft between the differential fluid pressure chambers in the housing and adapted to oscillate angularly with said shaft; valve means for the differential chambers including a sleeve slidable in the axial cavity in the shaft having respective open ends, respective axially spaced control ports and a fluid inlet port between the control ports, a piece mounted within the sleeve to move along the axis having lands spaced to cooperate with the control ports in the sleeve; a fluid inlet passageway in the shaft to the inlet port, a fluid inlet passageway in the housing to the shaft inlet passageway, a fluid passageway in the shaft between one of the control ports and one of the differential chambers, a fluid passageway in the shaft between the other of the control ports and the other of the differential chambers, a fluid passageway in the housing to the fluid outlet chamber and a passageway in the housing between the outlet passageway and the other end of the sleeve of the valve means; a settable input part, means for connecting the sleeve and the shaft to the settable input part to adjust the neutral point of the valve means, and input means having a part fixed to the housing and a part operatively connected to the land piece.

ERRATUM

For Class 91—384 see:
Patent No. 3,272,062



3,272,083
SPEED REGULATING VALVE
Kurt Stoll, 125 Hirschlandstrasse, Esslingen (Neckar), Germany
Filed Nov. 3, 1965, Ser. No. 513,627
Claims priority, application Germany, Mar. 18, 1961, F 33,444
6 Claims. (Cl. 91—405)

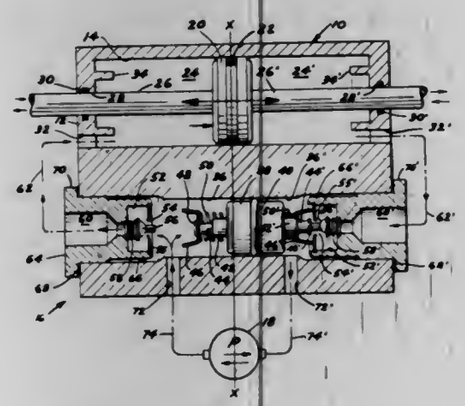


4. In an automatically controlled fluid system, a reversely movable piston, a contoured cam movable with said piston, a movable speed regulating valve mechanism including a movable valve element, a source of fluid, a fluid circuit connecting said fluid source with said piston and including fluid conduit means connecting said valve mechanism with said piston, said valve element being movable in said fluid circuit to open and close and variably regulate the passage of fluid through said circuit in two directions, means on said speed regulating valve mechanism engageable with said cam during the movement thereof and connected with said valve mechanism to cause the valve element to move an amount in accordance with the contour of said cam to vary the amount of the flow of fluid in one direction about said valve element to said piston according to the contour of said engaged cam whereby said piston is caused to move in one direction at speeds corresponding to the varied flow of fluid, said valve element being movable in response to fluid pressure in the reverse of said one direction of flow of fluid to reverse the direction of the flow of fluid to said piston to cause said piston to move in the reverse direction at speeds uncontrolled by the contour of said cam.

3,272,084
ROOF SUPPORT ASSEMBLIES SUITABLE FOR USE IN MINES
Douglas Herbert Hewlett Bolton, Winchcombe, Frank Pawling, Charlton Kings, and Michael Charles Potts, Prestbury, England, assignors to Dowty Mining Equipment Limited
Filed May 13, 1965, Ser. No. 455,541
Claims priority, application Great Britain, May 15, 1964, 20,382/64
7 Claims. (Cl. 91—414)

1. A roof support assembly including a series of advanceable roof supports, each roof support having at least one fluid-pressure-operated prop operable to set the support against a roof and a fluid-pressure-operated jack operable to advance the support, each roof support also having a valve assembly controlling the operation of the prop and the jack, the valve assembly being operated by the receipt of a signal from the preceding roof support in the series to cause its roof support to undergo an advancing operation, and the valve assembly being responsive to the satisfactory completion of the advancing operation of its roof support to send a signal to the next roof support in the series, and by-passing means operable from a position remote from the roof supports to cause the signal to be sent from one roof support to the next roof support in the event of failure of the roof support to satisfactorily complete an advancing operation.

3,272,085
FLUID SYSTEM AND VALVE ASSEMBLY THEREFOR
Louis G. Hajma, Warrensville Heights, Ohio, assignor to Parker-Hannifin Corporation, Cleveland, Ohio, a corporation of Ohio
Filed Nov. 19, 1963, Ser. No. 324,610
8 Claims. (Cl. 91—420)



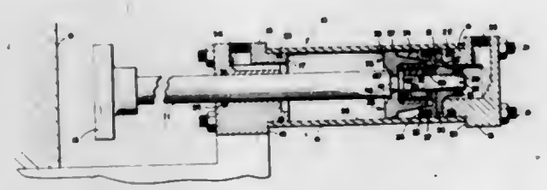
1. A directional control valve comprising a housing having a bore intersected axially therealong by inlet, cylinder, and return passages which are adapted to be connected, respectively, with a fluid pressure source, a fluid motor, and a reservoir; a valve spool reciprocable in said bore to positions selectively opening fluid communication

between said cylinder passage and said inlet and return passages; still another passage in said housing intersecting said bore, said another passage being in fluid communication with said inlet passage when said cylinder passage is communicated with said return passage as aforesaid; a check valve in said cylinder passage opened by fluid pressure when said cylinder passage is communicated with said inlet passage; and a fluid pressure actuated plunger means in said another passage operative to be moved to a position opening said check valve when said cylinder passage is communicated with said return passage and said another passage is communicated with said inlet passage; said check valve comprising pilot and main checks of which the former has a relatively small effective area as compared with the effective area of said plunger means, whereby a lower pressure acting on said plunger means than on said pilot and main checks tending to close the same will still be effective to cause said plunger means to open said check valve as aforesaid, thereby permitting return flow of fluid through said check valve to said return passage; said spool having metering means variably to restrict return flow from said cylinder passage to said return passage and thus to build up pressure in said cylinder passage tending to oppose movement of said plunger means in a direction opening said check valve; said plunger means being operative first to engage said pilot check to open the same and then said main check if the fluid pressure acting on said plunger means exceeds that which builds up in said cylinder passage due to metering by said spool as aforesaid.

3,272,086
REVERSIBLE SELF-LOCKING HYDRAULIC SYSTEM

Raymond A. Soeters, Royal Oak, Mich., assignor to Holley Carburetor Company, Warren, Mich., a corporation of Michigan

Filed Mar. 2, 1965, Ser. No. 436,494
3 Claims. (Cl. 91—420)



1. A closed hydraulic system, comprising a two-way hydraulic piston, a source of hydraulic pressure, means for applying said hydraulic pressure to one side or the other of said piston, means for relieving the pressure on the opposite side of said piston, and means for locking said piston against movement due to external forces when said source of fluid is inoperative, said first mentioned means including a spring-loaded check valve and said means for relieving and said means for locking including a second spring-loaded check valve and a piston having dual springs and dual slidable retainer members operatively associated therewith for permitting said second check valve to close when said source of hydraulic pressure is inoperative and for providing instantaneous opening of said second check valve when said source of hydraulic pressure is operative.

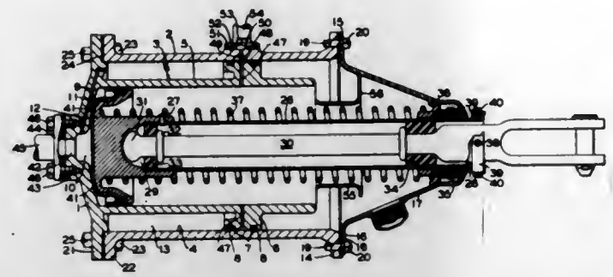
3,272,087
FORCE MULTIPLYING AND SAFETY POWER CYLINDER

Perrin C. Culver, Compton, Calif., assignor, by mesne assignments, to Compressed Air Service Company, Dayton, Ohio, a corporation of Ohio

Filed Oct. 9, 1964, Ser. No. 402,905
10 Claims. (Cl. 92—24)

1. A power cylinder device comprising
a cylinder,
piston means in said cylinder and movable through a stroke relative thereto,
a rod means in said cylinder and extending outwardly therefrom,
said piston means being movable relative to said rod means,
resilient means interconnecting said piston means and said rod means for transmitting a force from said piston means to said rod means,
and lock means for said rod means, said lock means including a plurality of members interposed between said rod and the inner circumferential wall of said cylinder, each of said members having a forward

outer corner adjacent said wall and an inner rearward corner adjacent the periphery of said rod means,
said lock means being operable by said piston means upon relative movement of said piston means and said rod means in opposition to said resilient means,
for rotating said members so as to bring said forward outer corner and said rearward inner corner of each of said members respectively into wedging engagement with said wall of said cylinder and said periphery of said rod means for precluding movement of said rod means through more than a predetermined limited increment of travel upon said relative movement.



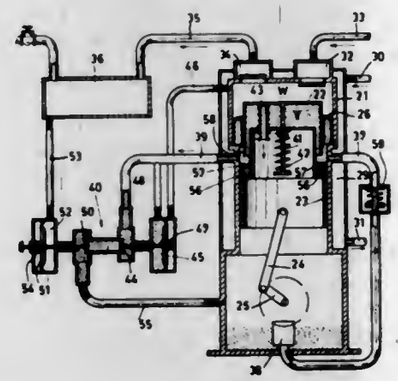
3,272,088
CONVERSION BRAKE CYLINDER

John E. Kistler, Atlanta, Ga., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Filed June 17, 1964, Ser. No. 375,852
9 Claims. (Cl. 92—59)

1. A brake cylinder device comprising:
(a) a brake cylinder body provided with a bore and a port opening at one end at the wall surface of said bore and at the opposite end to the exterior of the body for connection to an exterior device,
(b) a non-pressure head secured to one end of said brake cylinder body,
(c) a hollow sleeve, the outside diameter of which is less than the diameter of the bore in said brake cylinder body,
(d) a pressure head having one end of said hollow sleeve attached thereto whereby said pressure head can be secured to the other end of said brake cylinder body in substitution for the usual pressure head, to position said hollow sleeve in said brake cylinder body coaxial therewith,
(e) an out-turned flange formed integral with said hollow sleeve and located thereon so as to be in alignment with the end of the port that opens at the wall

surface of said bore in said brake cylinder body, said out-turned flange being provided with a passageway opening at one end at the inside wall surface of said hollow sleeve and communicating at the opposite end with said port, and

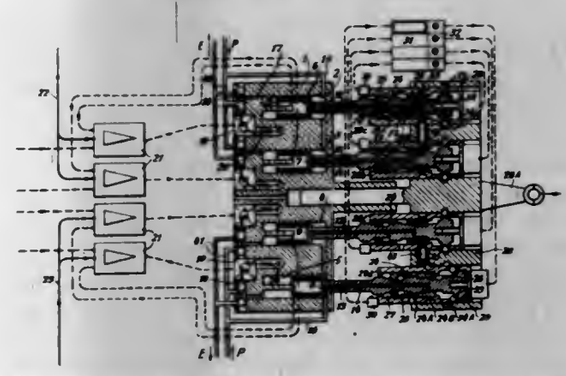


(f) sealing means interposed between the inside wall surface of said bore in said brake cylinder body and the periphery of said out-turned flange and providing a sealed communication between said passageway in said out-turned flange and the port in said brake cylinder body.

3,272,089
DEVICE FOR COMPRESSING OR EXPANDING A MEDIUM

Johan Adriaan Rietdijk, Emmasingel, Eindhoven, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware

Filed Nov. 12, 1964, Ser. No. 410,664
Claims priority, application Netherlands, Nov. 15, 1963, 300,572
3 Claims. (Cl. 92—83)

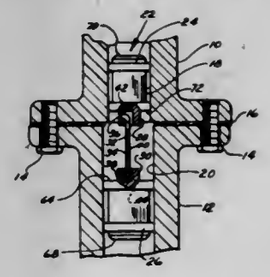


1. A device for compressing and expanding a medium comprising cylinder means, first and second piston-like bodies adapted to reciprocate in said cylinder means, a driving gear connected to said second piston-like body, said cylinder means and said first piston-like body defining a work space, said first piston-like body varying the volume of said work space when the same is reciprocated, a liquid column between said first and second piston-like bodies and engaging the side of said first piston-like body remote from said work space, a rolling membrane seal between said first piston-like body and said cylinder means and being in contact at least on one side thereof with said liquid column, means for maintaining a pressure difference on said rolling membrane that is substantially constant, said first piston-like body being provided with a sheath-like element extending in the direction of said second piston-like body, and a resilient, deformable sealing element at least partially surrounding said second piston-like body and which has an outer diameter that is smaller than the inner diameter of the adjacent wall of said cylinder means, said sheath-like element having such a length that at the minimum permissible distance between said two piston-like bodies said sheath-like element deforms said sealing element whereby a seal is effected between said second piston-like body and the adjacent wall of the cylinder means.

3,272,090
FAIL-SAFE HYDRAULIC ACTUATORS

Stafford Malcolm Ellis, London, England, assignor to Elliott Brothers (London) Limited, Lewisham, London, England, a British company

Filed Sept. 23, 1964, Ser. No. 398,612
Claims priority, application Great Britain, Sept. 25, 1963, 37,795/63
7 Claims. (Cl. 92—140)

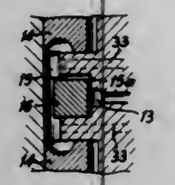


1. A parallel redundant hydraulic actuator system comprising three or more control paths each including an actuator unit which includes means whereby any one of the actuator units may be disengaged as the result of a malfunction or other event, latching means including a plurality of members each unpositively interlocked with an associated one of said actuators, said members being movable to unlock from its associated unit upon disengagement thereof, and means for transmitting movement of one member to the other members and effective upon the disengagement of the last of a predetermined number of actuator units to move said members to positively interlock with at least two remaining engaged units.

3,272,091
PISTON ASSEMBLY

Walter F. Dziedzic, Detroit, Mich., assignor to Holley Carburetor Company, Warren, Mich., a corporation of Michigan

Filed Nov. 27, 1964, Ser. No. 414,945
5 Claims. (Cl. 92—152)

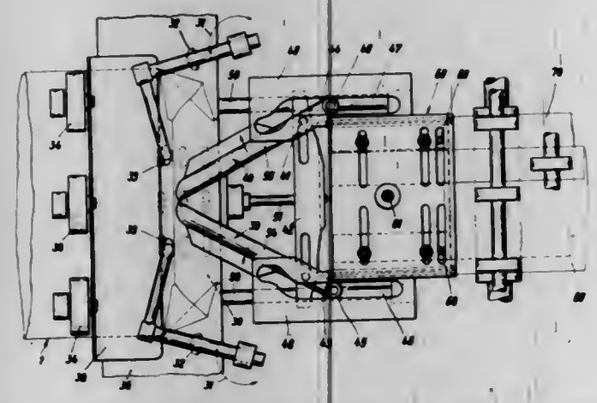


1. A piston assembly for reciprocating movement within adjacent misaligned cylinders, said assembly comprising first and second pistons, the adjacent end of each of said pistons having an extension formed thereon, each of said extensions having intersecting axial and transverse openings formed therein, and an elongated connector having the ends thereof bent to form right angles with the axis of said connector and with each other, said ends being inserted into said transverse openings.

3,272,092
LUBRICATING ARRANGEMENT FOR A RECIPROCATING COMPRESSOR

Oskar Vielmo, Stuttgart-Sonnenberg, and Josef Trui, Bissingen, Germany, assignors to Robert Bosch G.m.b.H., Stuttgart, Germany

Filed Jan. 26, 1965, Ser. No. 428,100
Claims priority, application Germany, Feb. 27, 1964, B 75,621
6 Claims. (Cl. 92—157)

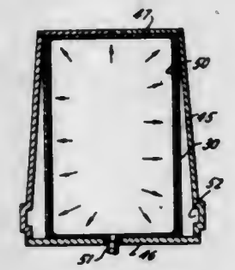


1. In a compressor, in combination, a cylinder member; a piston member mounted in said cylinder member for axially reciprocating movement, said members having respective closely adjacent circumferential walls; a plurality of axially spaced sealing ring means on said wall of the piston member in sliding engagement with said wall of the cylinder member, said piston member being formed with an annular groove axially intermediate two of said sealing ring means; a control ring arranged in said groove, said ring being dimensioned for limited axial and radial movement in said groove during said reciprocating movement of the piston member and defining a circumferentially extending channel in said groove; lubricant feed means for feeding a liquid lubricant to one circumferential portion of said channel; and lubricant return means for withdrawing at least a portion of the fed lubricant from another portion of said channel circumferentially spaced from said one portion.

3,272,093
METHOD AND APPARATUS FOR THE MANUFACTURE OF A SQUARE-BOTTOM-BAG OF A WELDABLE MATERIAL

Friedrich Franz Brockmüller, Lengerich, Westphalia, Germany, assignor to Windmöller & Hölscher, Lengerich, Westphalia, Germany

Filed July 16, 1963, Ser. No. 295,440
Claims priority, application Germany, July 21, 1962, W 32,643
16 Claims. (Cl. 93—8)



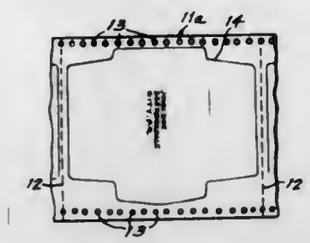
7. A device for manufacturing flat-bottom bags of weldable material from tubular stock, comprising in combination, a suction device adapted to open one end of a flattened tubular section of weldable material, said suction device including a suction plate, air suction means operatively mounted in said suction plate for holding the lower wall of said flattened tubular section, a pair of sucker arms pivotably mounted in said device above said suction plate and adapted to engage the upper wall of said flattened tubular section and open thereby said end of said flattened tubular section, a plate fixedly mounted adjacent said suction plate and adapted to define a center fold in the tubular stock and to support a portion of said upper wall of said tubular section which is folded back during the opening of the end thereof, a pair of spreader arms swingably mounted in said device adjacent to said suction plate and adapted to spread the opened end of said tubular section until said end assumes a substantially flat configuration with a pair of corner folds, base sheet feeding means operatively mounted in said device and adapted to position at least one base sheet on said end of said tubular section spread by said pair of spreader arms so that the edges of said pair of corner folds are covered by said base sheet and welding jaw means operatively mounted in said device and adapted to weld said base sheet to said end while the latter is being spreadingly held by said pair of spreader arms.

3,272,094
TAPERED FIBER DRUM AND METHOD OF MAKING THE SAME

Herbert L. Carpenter, Jr., Babylon, N.Y., assignor to The Greif Bros. Cooperage Corporation, Delaware, Ohio, a corporation of Delaware

Filed Jan. 23, 1964, Ser. No. 339,751
15 Claims. (Cl. 93—39.1)

1. The method of forming a tapered fiber shell for use in a tapered container body suitable for stacking in nested relation with other similar container bodies which comprises: first forming a tubular shell of substantially uniform cross-sectional size and shape from end to end from convolutely wound layers of fibrous material laminated together and then while the paper is in stretchable deformable condition placing one surface of the shell immediately adjacent a tapered form while applying a force between the form and the shell to cause the shell to conform in shape to the form and assume a tapered configuration increasing gradually and substantially uniformly in cross-sectional dimension from one end to the other.



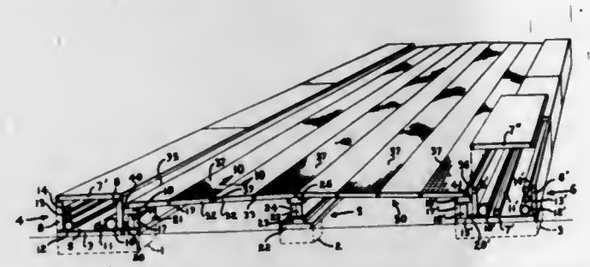
3,272,095
CONTINUOUS PROCESS FOR ADDRESSING AND FORMING ENVELOPES

Jack Heuff, 1284 Osborne Ave., Verdun, Quebec, Canada

Filed Aug. 26, 1963, Ser. No. 304,353
Claims priority, application Canada, July 17, 1963, 880,390, Patent 686,619
9 Claims. (Cl. 93—61)

1. A process for addressing and making a series of envelopes which comprises continuously feeding a single thickness of continuous stock tab paper consisting of a plurality of interconnected tab units to a computing machine suitable for handling such paper and having a printing mechanism actuatable for translating into print onto one side of each of said tab units information corresponding to a series of different names and addresses fed into it, said continuous stock tab paper being provided with

locating means adapted for co-operation with feeding means of said computing machine to control the travel of said paper successively to present a selected area of each of said tab units to said printing mechanism while actuating said printing mechanism whereby each said unit

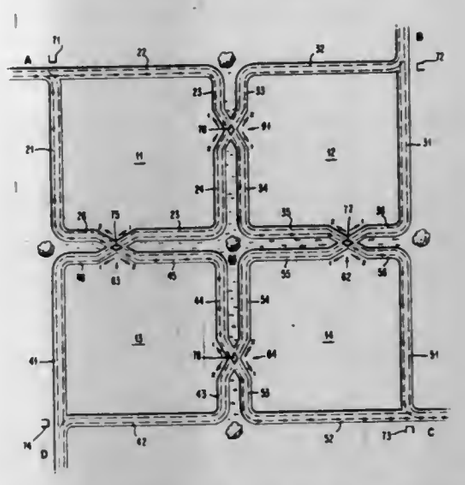


is printed in said selected area with a name and address corresponding to said information, die cutting each of said printed tab units to produce an envelope blank and converting each of said blanks into an envelope using as the front face thereof the printed side of said blank.

3,272,096
ROADWAY STRUCTURE AND METHOD OF MAKING SAME

Quon C. Lum, 1931 N. King St., Honolulu, Hawaii

Filed Apr. 2, 1963, Ser. No. 270,080
10 Claims. (Cl. 94—1)



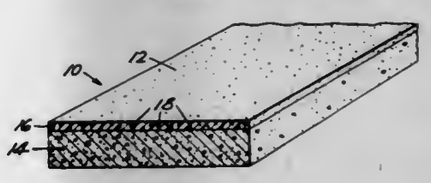
1. A roadway structure comprising spaced foundation means, spaced side support portions supported by said foundation means, said support portions comprising a plurality of individually pre-cast, individually pre-stressed concrete modules adhesively secured to one another, a main roadway portion comprising a plurality of individually pre-cast, individually pre-stressed concrete modules disposed in edge-to-edge relationship with one another, epoxy means adhesively securing said last-mentioned modules together only along the abutting edges thereof to form a main roadway portion having a smooth upper surface for supporting vehicles moving thereover, said main roadway portion being supported at the opposite longitudinally extending edges thereof by said support portions, central support means supporting a central portion of said main roadway portion with the remaining portions of the main roadway portion between said central support means and said side support portions supported solely by the adhesive interconnection with adjacent modules of the main roadway portion, said side support portions including spaced modules defining gutters at opposite sides of said main roadway portion to receive liquid and other material from said main roadway portion, said side support portions also including spaced modules defining storm drains for receiving liquid from said gutters and for draining away liquid to an underlying surface, said side support portions also including spaced modules defining enclosed areas adjacent said storm drains, the top of each of said enclosed area being closed by modules forming a cover portion which also serves as a sidewalk for pedestrians.

3,272,097
TRAFFIC INTERSECTION

Denos C. Gazis, Millwood, N.Y., and Renfrey B. Potts, Erindale, South Australia, Australia, assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Dec. 9, 1963, Ser. No. 329,070
10 Claims. (Cl. 94—1)

7. In a traffic control and roadway system controlling the flow of continuous streams of traffic through an intersection, the roadways of said intersection surrounding a four block matrix forming four pairs of adjacent interior roadways, and four peripheral roadways between the corners of the matrix and said interior roadways, the system comprising:



traffic controlling means located at the outer corners of the matrix for directing traffic approaching the corners of the matrix alternately in a clockwise direction about the peripheral roads of the matrix and then in a counter-clockwise direction; and

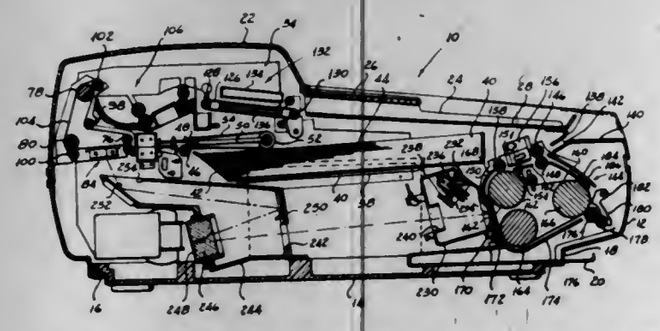
four additional traffic controlling and guiding means each located along a different pair of interior roadways for directing and switching the traffic from one interior roadway to the other adjacent interior roadway and vice versa.

3,272,098
PAVING MATERIAL AND PAVING SURFACING

Theodore Buchholtz, St. Paul, George M. Rambosek, Maplewood, and Richard G. Drew, St. Paul, Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware

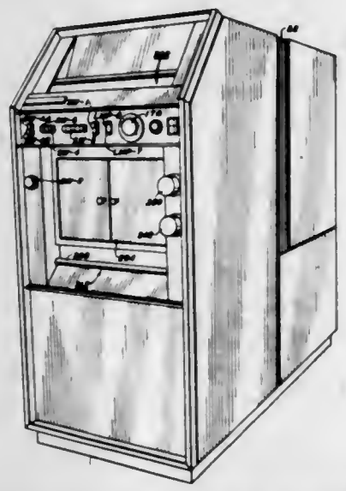
Filed July 23, 1962, Ser. No. 211,513
7 Claims. (Cl. 94—7)

1. A tough resilient paving surfacing adhered to a rigid substrate which paving surfacing is capable of quick, simple repair and which maintains good non-slip characteristics when wet, said surfacing being resiliently deformable and having a Shore A_2 scale durometer in the range of about 30 to 80, said surfacing comprising in combination about 90% to 50% by volume of a cross-linked resilient polymeric organic polyol based polyurethane rubber and about 10% to about 50% by volume of resilient aggregate, said aggregate being of an average size in the range of about one-sixteenth of an inch to about three-quarters of an inch, said surfacing being directly bonded to said substrate and being the



solidified product of a substantially volatile solvent free 100% solids forming liquid material carrying said aggregate therewithin and being capable of solidifying at ambient temperature to a non-flowing slump resistant state in a period of about one hour said liquid material comprising a reaction mixture consisting essentially of organic polyol and organic polyisocyanate in amounts providing an approximately equivalent number of NCO to OH groups, and an ambient temperature curing catalyst therefor.

3,272,099
STRINGLINE ATTACHMENT FOR PAVING MACHINE
Frank M. Drake, Topeka, Kans.
(612 W. 47th St., Kansas City, Mo. 64112)
Filed Jan. 31, 1963, Ser. No. 255,332
9 Claims. (Cl. 94—46)

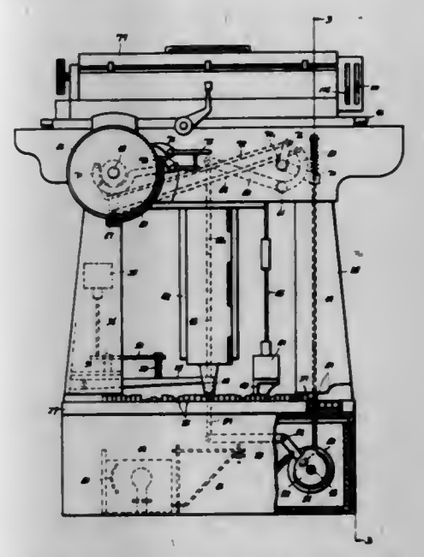


4. In a paving machine of the type having a main body, mobile on a roadway, a screed carried in towed relation on a pair of rocker arms pivoted on said body, means adjustably connecting said screed and said arms to vary the attitude of said screed with respect to said rocker arms, and sensing means operatively associated with said screed, the improvement comprising an elongated walking beam medially pivoted to and extending well in advance of and to the rear of said body, on a shaft extending laterally from one side thereof, a ground-engaging wheel carried at each of the outer ends of said walking beam, anchor means for a stringline carried by said walking beam near each end thereof, and a stringline attached at its ends to said anchor means said sensing means being in contact with a point midway of said stringline.

3,272,100
ELECTROSTATIC COPIER
Marvin W. Teutsch, Phoenix, Ariz., assignor to Nuclear Corporation of America, Phoenix, Ariz., a corporation of Delaware
Filed Oct. 30, 1963, Ser. No. 320,159
8 Claims. (Cl. 95—1.7)

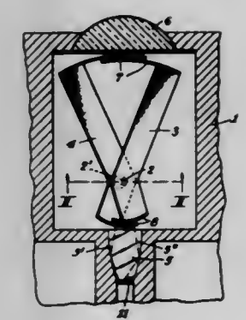
1. A copying machine for producing copies of an original on photoconductive copy sheets including in combination means for applying an electrostatic charge to a sheet, an open exposure window through which a charged sheet is exposed to an image of the original to produce a latent electrostatic image of the original, a plurality of filament strands extending across said window for supporting a sheet, a developing station at which the exposed sheet is subjected to the action of toner to develop said latent image, said developing station having an entrance, respective conveyors having contiguous lengths thereof extending from adjacent said window to the entrance of said developing station, means comprising said contiguous conveyor lengths for carrying charged sheets successively past said charging means and said window and said developing station, an original exposure window, an original transport system for carrying an original past said original exposure window, means for transferring an image of an original passing said exposure window to a photoconductive copy sheet passing by said open exposure window, means responsive to entry of an original into said original transport system for activating said copy carrying means, means adapted to be actuated to recirculate said original through said original transport system, means for counting the number of passages of an original through the original transport system and means responsive to said counting means for deactivating said carrying means.

3,272,101
XEROGRAPHIC APPARATUS
Thomas C. Murray, Rochester, Russell R. Roberts, Ontario, and Norbett H. Kaupp, Newark, N.Y., assignors to Xerox Corporation, Rochester, N.Y., a corporation of New York
Filed Mar. 3, 1964, Ser. No. 348,950
3 Claims. (Cl. 95—1.7)



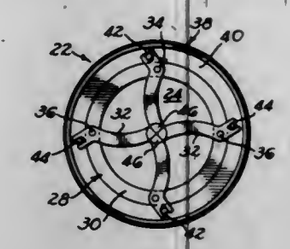
1. A xerographic apparatus for processing multiple xerographic plates including:
a plate transport system for asynchronously moving xerographic plates through a series of processing stations,
the plate transport system comprising:
(a) a series of drive rollers and pinch rollers to drive the xerographic plates between the process stations,
(b) guide rollers to properly align the plates,
(c) a motor to drive the drive rollers, and
(d) stopping means to regulate the movement of the xerographic plates through the process stations,
a corona generating device positioned adjacent to the transport system to place a uniform charge on a xerographic plate as it moves in the transport system,
a series of processing stations including:
a plate loading station adapted to receive a xerographic plate in a position to be carried by the transport system, and located immediately ahead of the corona discharge device,
an exposure station wherein a xerographic plate is exposed to a light image to form a latent electrostatic image on said plates comprising:
(a) a copy board, movably mounted on a frame, upon which is mounted an image to be reproduced,

(b) a lens system, held in a support frame that is movable to points intermediate a xerographic plate in the transport system and the copy board, whereby the lens can be adjusted to focus the image from the copyboard onto the xerographic plate,
(c) a shutter assembly positioned to control the passage of light from the image to the xerographic plate,
(d) a lamp system to provide a light source capable of reflecting the image on the copy board to the xerographic plate,
(e) a light shield positioned to prevent extraneous light from reaching the surface of the xerographic plate, and
(f) a timing device to actuate the shutter and light system for a predetermined period of time,
a developing station to develop a latent image upon an electrostatically charged and exposed xerographic plate comprising:
(a) a housing capable of holding a quantity of developing material and having an opening adapted to receive a xerographic plate,
(b) a means to clamp the xerographic plate in the housing opening,
(c) a pair of pivot arms holding the housing and rotatably mounted so that the housing may be rotated through a series of positions whereby developer in the housing is cascaded over a plate in the housing opening,
(d) means to program and control a predetermined number of movements of the housing through the series of positions, and
(e) means to effect removal of the xerographic plate from the developer housing upon termination of the predetermined number of movements,
and a control means to regulate the asynchronous movement of plates between processing stations so that plates are advanced to successive stations only upon removal of plates from each station, said control means being asynchronous so that more than one process can be carried on at one time, and including means to retain a plate in the exposure station for more than one exposure.



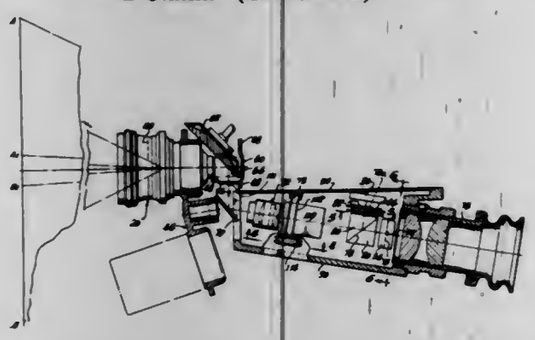
3,272,102
PHOTO-TYPESETTING MACHINES
Nobuo Morisawa, 351 Hitomaru-cho, Akashi, Japan
Filed Aug. 5, 1963, Ser. No. 300,018
2 Claims. (Cl. 95—4.5)

1. A photo-typesetting machine comprising a straight, linear letter board, a plate on which said letter board is mounted, said plate being movably mounted on said machine for linear reciprocating movement, said plate having a rack thereon extending along the length thereof, said plate further having a plurality of adjusting pieces thereon each having a height proportional to the breadth of a corresponding letter on the letter board, pawl means engageable with said rack for holding said rack and said letter board in a fixed position, said pawl means including an electromagnetic actuating means for thus engaging said pawl means with the rack, a photographic lens system fixedly mounted on said machine above said letter board and including a shutter mechanism, electromagnetic shutter actuating means coupled to said shutter, a magazine above said lens system and having means for moving a sheet of photosensitive material past the upper end of said lens system, and means for moving said magazine past the end of said lens system in the same direction as the extension of said letter board and including a ratchet wheel, a cover for said ratchet wheel and a ratchet engageable with said wheel for rotating said wheel when said cover is rotated, and a cover and ratchet moving means including a linkage coupled to said cover and having a feeler engageable with said adjusting pieces on said plate for limiting the movement of said linkage so that it is proportional to the height of said adjusting pieces, and further including a motor, a



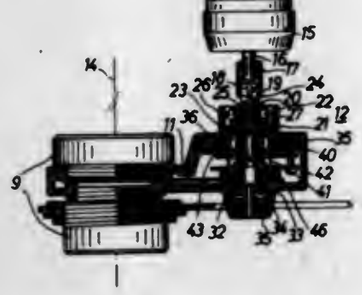
camshaft, an electromagnetic clutch coupling said motor and said camshaft, said clutch being coupled to and actuated by said electromagnetic shutter actuating means, cam means on said camshaft, said linkage engaged with said cam means and moved by said cam means.

3,272,103
PHOTOELECTRIC MEASURING DEVICE
Martin Ploke, Kiel, Germany, assignor to Zeiss Ikon Aktiengesellschaft, Stuttgart, Germany
Filed Oct. 31, 1963, Ser. No. 320,317
Claims priority, application Germany, Nov. 7, 1962, Z 9,757
8 Claims. (Cl. 95—10)



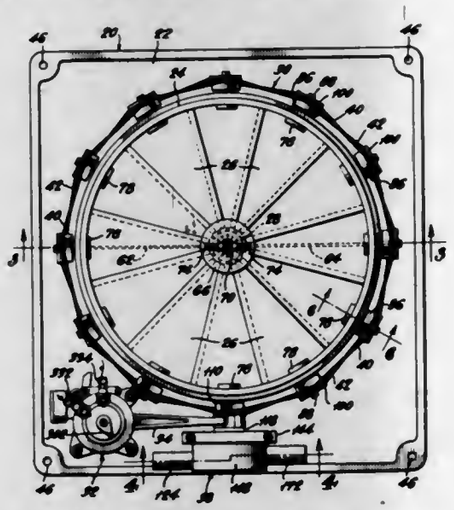
5. A device for photoelectric optometry having an optical axis including an objective arranged in said optical axis in front of a photoelectric measuring surface, an adjustable field of vision diaphragm (8) positioned in the focal plane of said objective, a second adjustable diaphragm (7) arranged in axially spaced relation from said first mentioned field of vision diaphragm, two double-armed pivotally connected levers operatively connecting said two diaphragms with one another so that an adjustment of one of said diaphragms in one direction causes an adjustment of the other one of said diaphragms in the opposite direction, and light collecting optical means arranged in the area of said focal plane in front of said photoelectric measuring surface through which the measuring light rays pass before they reach said measuring surface.

3,272,104
CAMERA WITH LIGHT MEASURING DEVICE
Harold R. Lytton, 11540 Blix, North Hollywood, Calif.
Filed Feb. 9, 1965, Ser. No. 431,259
3 Claims. (Cl. 95—10)



1. In combination with a camera receiving light along a predetermined light path, a light measuring device including:
(a) supporting means located externally of the light path;
(b) a plurality of arms having inner and outer ends;
(c) photosensitive elements respectively carried by the inner ends of said arms;
(d) means mounting said outer ends of said arms on said supporting means for swinging movement of said arms in a plane perpendicular to the light path from inoperative positions wherein said arms and said photosensitive elements are located externally of the light path, through a series of first operative positions wherein said photosensitive elements are uniformly spaced apart within said light path, to second operative positions wherein said photosensitive elements are in juxtaposition at the center of said light path;
(e) actuating means for swing said arms between said inoperative positions and said second operative positions through said first operative positions; and
(f) said photosensitive elements being electrically interconnected to provide a composite measurement of the light incident thereon.

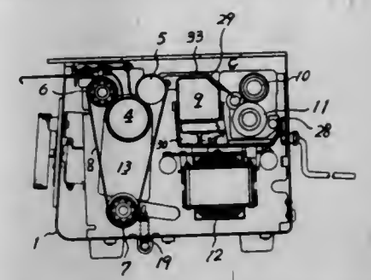
3,272,105
EXPOSURE METER SYSTEM
Emanuel C. Manderfeld, Hollywood, Calif., assignor to Mitchell Camera Corporation, Glendale, Calif., a corporation of Delaware
Filed Apr. 13, 1964, Ser. No. 359,102
1 Claim. (Cl. 95—42)



An integrated motion picture camera and exposure guide system comprising in combination
camera mechanism including a film aperature and an objective lens of continuously variable focal length for focusing at the film aperture a film image representing a correspondingly varying angular portion of a scene to be photographed,
light sensor means having a light responsive surface of predetermined area and producing an electrical output corresponding to the brightness of illumination of that area,
optical finder means having a focal plane and ocular lens means for viewing an optical image in the focal plane,
optical means in the path of light from the objective lens for dividing said light to form auxiliary ocular and sensor images respectively at the finder focal plane and in position to illuminate the light responsive surface, said auxiliary images representing angular portions of the scene that correspond to the angular portion represented by the film image,
visual indicating means optically positioned in the focal plane of the finder to be visible simultaneously with the ocular image and comprising fixed scale means and an element movable relative to the scale means in response to the magnitude of said electrical output, said scale means including a point that represents nominally correct film exposure.
and manually operable means for simultaneously varying in equal proportions the brightness of at least the film image and the sensor image for setting the camera exposure in accordance with the visual indicating means,
whereby brightness indications are visible in the finder for a continuously variable plurality of angular scene portions simultaneously with the finder image showing such scene portion, each such brightness indication including an indication of the relation between the existing camera exposure setting and a nominally correct exposure for that scene portion.

3,272,106
OPTICAL COPYING MACHINE
Roland Czekalla, Munich, Germany, assignor to Agfa Aktiengesellschaft, Leverkusen, Germany
Filed Dec. 9, 1964, Ser. No. 417,034
Claims priority, application Germany, Dec. 10, 1963, A 44,749
12 Claims. (Cl. 95—58)

1. In an optical copying machine, in combination, objective means having a predetermined optical axis; rotary shaft means located beside said objective means and extending parallel to said optical axis; shutter means carried by said rotary shaft means for turning movement therewith between positions respectively closing and opening said objective means; rotary electromagnetic means operatively connected to said shaft means for turning the latter to displace said shutter means between said positions, said electromagnetic means turning through an angle greater than that through which said shutter means turns during displacement of the latter from one to the other of said positions thereof; and clutch means operatively connected to said shaft means and electromagnetic means for transmitting rotation of the latter to said shaft means, said clutch means yielding to provide for rotary movement of said electromagnetic means when the latter turns after said shutter means has stopped turning, said clutch means including an inner cylinder and an outer cylinder coaxially surrounding said inner cylinder, said cylinders being respectively connected to said shaft means and said electromagnetic means, and said inner cylinder being formed with a bore which receives a spring and part of a ball pressed by said spring outwardly of said bore against an inner surface of said outer cylinder, said inner surface of said outer cylinder being formed with a pair of depressions for receiving said ball and said depressions being angularly displaced from each other by an angle equal to the difference between the angle through which said rotary electromagnetic means turns and through which said shutter means turns.

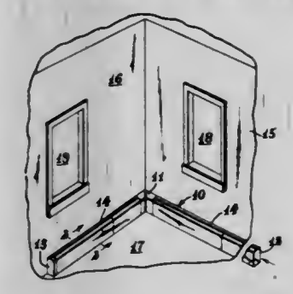


3,272,107
RADIAL VANE SHUTTER
Stanley D. Bloemendaal, Melbourne, Fla., assignor to Geo Space Corporation, a division of Western Equities, Inc., Houston, Tex., a corporation of Nevada
Filed Apr. 23, 1965, Ser. No. 450,389
30 Claims. (Cl. 95—59)

1. A radial vane shutter for use with a ballistic camera comprising a cylindrical housing, a plurality of pie-shaped shutter blades, means for pivotally mounting said shutter blades within said housing for pivotal movement between a closed position wherein the blades are prependicular to the axis of said cylindrical housing and block the passage of light therethrough and an open position wherein said blades are pivoted about 90° from said closed position to freely pass light through said cylindrical housing, linkage means encircling said cylindrical housing and connected to the outer end of each of said blades for pivoting the blades between said open and closed positions when the linkage means is actuated, high speed intermittent clutch means driven by a continuously rotating source for converting said continuous rotary motion to intermittent rotary motion, said clutch means including means for engaging said clutch means with said continuously rotating source for rotation thereby through a predetermined angle and disengaging said clutch means after it rotates through said predetermined angle, and drive means for connecting said clutch means to said linkage means to pivot said blades between said open and closed positions.

3,272,108
POSITIVE PICTURE COPIER
Tosio Isikawa, Minami-ku, Osaka, Japan, assignor to Minolta Camera Kabushiki Kaisha, Osaka, Japan
Filed Jan. 6, 1964, Ser. No. 335,858
Claims priority, application Japan, Mar. 30, 1963, 38/24,102; Apr. 5, 1963, 38/25,413; Apr. 7, 1963, 38/25,792
1 Claim. (Cl. 95—77.5)

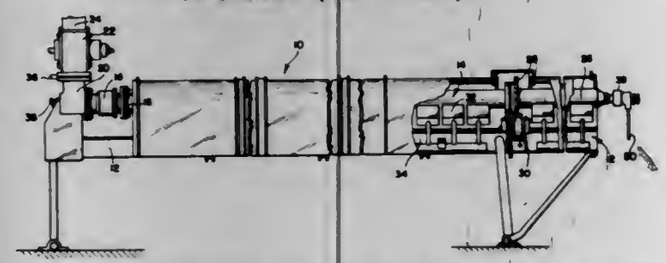
A photocopy apparatus of the character described, comprising a housing, a pair of spaced parallel rollers rotatably mounted within the housing, an endless belt looped over said rollers and providing a depending cradle loop therebetween, a light tube rotatably supported by said cradle loop, means driving the rollers and belt to thereby rotate the light tube, a tensioning roller rotatably mounted within the housing and positioned below the light tube, said endless belt being looped around said tensioning roller, whereby the light tube is urged upwardly against said pairs of rollers; said rollers, endless belt and light tube being constructed and arranged to form a space extending transversely of the housing, fan means secured to the housing and communicating with said space whereby relatively cool air is blown through the space to maintain



the light tube at a proper temperature while emitting light at the desired intensity, and a developing device mounted within the housing adjacent to said pairs of rollers, said developing device including a dish, a buoyant reservoir for developing fluid freely mounted within said dish, valve means mounted on the bottom wall of said reservoir for controlling the flow of fluid therefrom to said dish and a table pivotally mounted on said housing and positioned above the top wall of the reservoir, said valve means being operatively connected to the bottom of said dish, and the upper wall of said reservoir being adapted to abut the table whereby communication is constantly maintained between the interior of said reservoir and said dish.

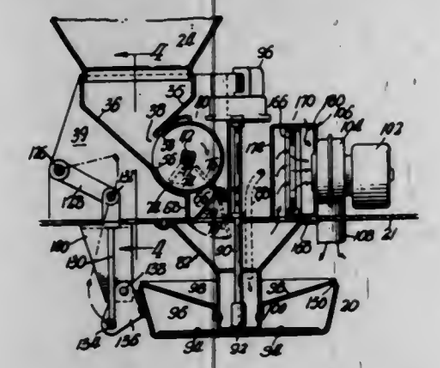
ERRATUM

For Class 98—1.5 see:
Patent No. 3,272,608



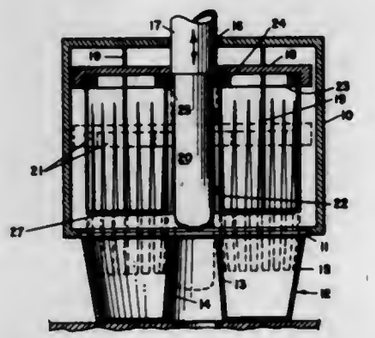
3,272,109
AIR FLOW DISSEMINATING APPARATUS
Ernest E. Brandes, 4900 Camden Road, Madison, Wis.
Filed Oct. 28, 1964, Ser. No. 407,121
6 Claims. (Cl. 98—40)

4. In combination, an elongated air-conducting cabinet having inlet and outlet openings, one of said openings being elongated and extending lengthwise of the cabinet, said openings providing a passage for air through the cabinet, and means for controlling the quantity of air passing through said elongated opening, said means comprising a damper unit extending into the cabinet through said elongated opening and having a fixed part defining a passageway through said elongated opening, a damper element disposed outside said passageway and extending across said passageway, means supporting the damper element in proximity to the inner end of said passageway, and means for adjusting the supporting means to change the location of the damper element relative to the said inner end of the passageway from a



location at which said damper element closes said passageway to a location at which the said damper element interposes a minimum restriction in the flow of air through the passageway, said fixed part comprising spaced sheets having flanges along corresponding longitudinal edges extending away from said passageway, one pair of said flanges constituting means for supporting the damper unit from the cabinet, and another pair of said flanges defining with the damper element opposed orifices leading into said passageway.

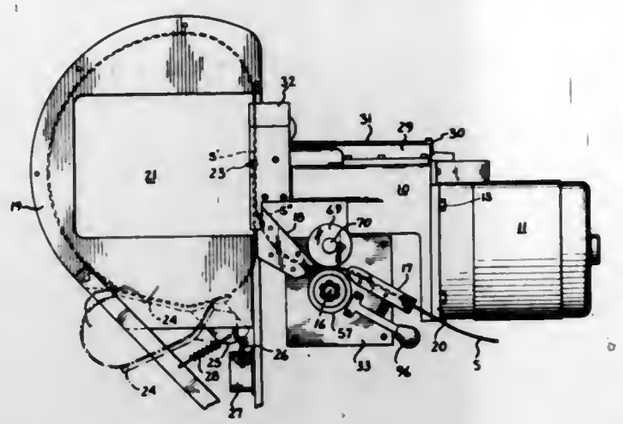
3,272,110
DISCHARGE DEVICE
Takuzo Tsuchiya, Minneapolis, Minn., assignor to General Mills, Inc., a corporation of Delaware
Filed May 10, 1963, Ser. No. 279,561
10 Claims. (Cl. 99—238)



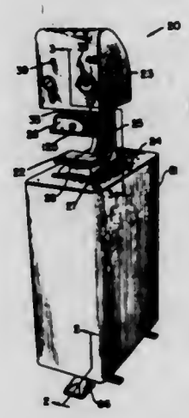
1. In a puffing gun from which pellets are discharged with a fluid along a predetermined path, a discharge device comprising a nozzle and a housing having an expansion section, which nozzle and expansion section collectively define a display passage for said pellets and said fluid, said nozzle being located at the discharge end of said gun and defining a restricted throat portion of said discharge passage through which said fluid and said pellets are emitted from said gun in a downstream direction along said predetermined path at a relatively high velocity, said expansion section defining an expansion portion of said discharge passage located downstream of said throat and having an enlarged cross sectional area with respect to said throat, said discharge device defining a relief passage which opens to said discharge passage at a location removed from said path so as to permit fluid in said discharge passage to be diverted from said path into said relief passage while permitting said pellets to be properly discharged through said outlet passage, thereby reducing noise level and enabling the recovery of a portion of said fluid in reusable form.

3,272,111
CORN POPPER
Charles J. Cretors, 1097 Crofton Ave., Highland Park, Ill.
Filed May 17, 1963, Ser. No. 281,206
4 Claims. (Cl. 99—238.7)

1. In a corn popper, a corn popping chamber, means for withdrawing air from said chamber at a predetermined rate, a passageway interconnecting said chamber and said withdrawing means, a filter element disposed in said passageway for straining foreign matter from said air, means for heating said filter element to a temperature at which said foreign matter will be volatilized when said air is moving at substantially less than said predetermined rate, and by-pass means in said passageway to by-pass the volatilized foreign matter from said passageway.



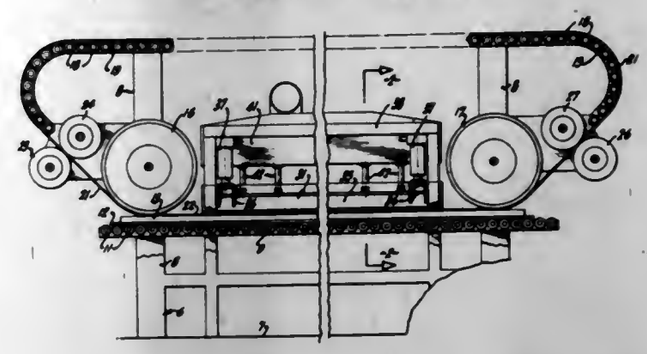
3,272,112
ANGEL FOOD CAKE TIN REMOVER
Theodore T. Law, 2711 Southwest Drive, Los Angeles, Calif.
Filed June 1, 1964, Ser. No. 371,404
12 Claims. (Cl. 99—426)



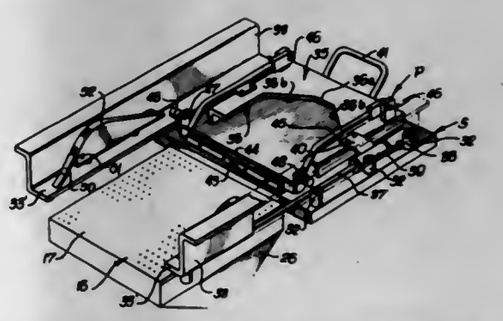
1. An apparatus for loosening angel food cakes from angel food cake tins which have outer sidewalls and an inner cone, said apparatus comprising, in combination: a frame; head means movably mounted within said frame; a pilot member axially extending from and carried by said head means and designed in an operating position to fit within said cone; a first plurality of resilient fingers carried by said head means and circumferentially spaced from and arranged about said pilot member, said first plurality of fingers being designed in an operating position to engage the inner sides of said outer sidewalls to thereby separate the cake therefrom; a second plurality of resilient fingers carried by said head means and circumferentially spaced from and arranged about said pilot member on a different diameter, said second plurality of fingers being designed in an operating position to engage the outer sides of said inner cone to thereby separate the cake therefrom; and, means for moving said head means to bring said pilot member and said first and second plurality of fingers to said, respective, operating positions.

3,272,113
POWER STRAPPING MACHINE AND THE LIKE AND ADJUSTABLE FEEDING AND TENSIONING MEANS THEREFOR
Howard K. Otto, Berkeley, Ill., assignor to Signode Corporation, Chicago, Ill., a corporation of Delaware
Filed Dec. 14, 1964, Ser. No. 418,039
18 Claims. (Cl. 100—26)

1. In a strapping machine for binding bundles and the like with a band of tensioned strap, the combination of means providing a frame, prime mover means, means for guiding strap through said frame, reversible means for feeding strap through said guiding means and applying tension to and shrinking such strap about a bundle, said reversible means including a back up wheel rotatable on an axis of reaction and a traction wheel and rotatable shaft therefor between and by which strap is fed and tensioned in opposite directions, and a driven eccentric movably connected to said prime mover means and rotatably mounting said shaft to rotate about a floating axis and shift the traction wheel towards and away from said back up wheel in accordance with the loading imposed on the prime moving means in advancing the strap.



3,272,114
HEAT SEALING APPARATUS
James A. Rakel, Cincinnati, Ohio, assignor to The National Marking Machine Co., Cincinnati, Ohio, a corporation of Ohio
Filed May 15, 1964, Ser. No. 367,783
1 Claim. (Cl. 100—53)

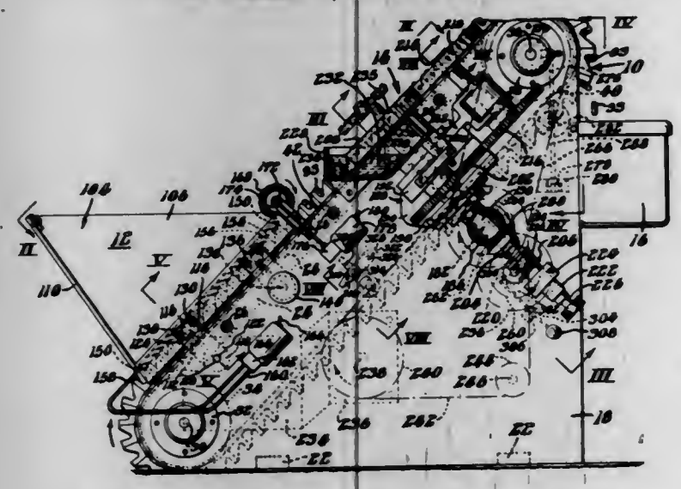


A heat sealing apparatus or the like comprising support means, a fixed head carried by said support means and having a surface means, a piston and cylinder arrangement carried by said support means, a movable head operatively interconnected to said piston and having a surface means cooperable with said surface means of said fixed head to heat seal material therebetween, a solenoid operated valve for directing fluid pressure to said cylinder to move said movable head away from said fixed head when no electrical current is supplied to said solenoid and for directing fluid pressure to said cylinder to move said movable head toward said fixed head when electrical current is supplied to said solenoid, lever means for causing electrical current to flow to said solenoid when said lever means is moved to one position thereof, timer means for terminating the supply of electrical current to said solenoid when a predetermined time has lapsed, and a safety bar means for terminating the supply of electrical current to said solenoid when said safety bar means is moved to one position thereof regardless of the condition of said lever and said timer, and said safety bar means preventing said electrical current from flowing to said solenoid until said safety bar means is moved to another position thereof and said lever has been moved to another position thereof.

3,272,115
CONTINUOUS LAMINATING PRESS
Franklin C. Hurlbut, Berkeley, Calif., assignor to The Regents of the University of California, Berkeley, Calif.
Filed Sept. 11, 1964, Ser. No. 395,735
14 Claims. (Cl. 100—93)

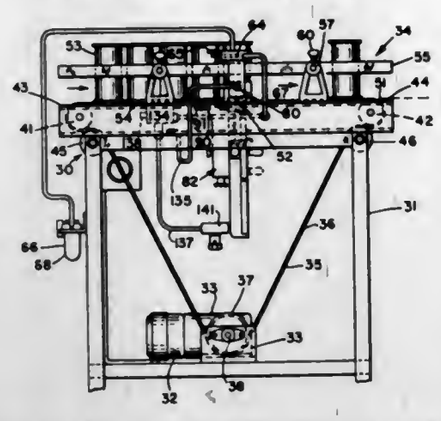
1. A continuous laminating press comprising a frame, means on said frame for supporting a plate, means on said frame for supporting an endless belt with one run of said belt extending adjacent to said plate, an endless belt on said belt supporting means, a pressure box having an opening on one side bounded by edges, means for supporting said pressure box on said frame with said edges adjacent to but spaced from said belt on the side thereof opposite said plate to leave between said edges and said belt a predetermined clearance passageway extending from said box to the atmosphere, and means for supplying air under pressure to said pressure box and to said passageway continuous outflow through said passageway between said edges and said belt, said outflowing air acting as a spacer between said edges and said belt.

3,272,116
JUICE EXTRACTOR FOR TESTING CITRUS FRUIT
David U. White, La Habra, Calif., and Harold M. Rebeck, Clearwater, Fla., assignors to Brown Citrus Machinery Corp., Whittier, Calif., a corporation of California
Filed Nov. 5, 1964, Ser. No. 409,180
11 Claims. (Cl. 100—112)



1. A citrus fruit juice extractor comprising, a frame: a platform on said frame for supporting a citrus fruit half with the cut face engaging the platform; a pair of pressure members relatively movable on the frame; positioning means movable between a retracted position above said platform and an extended position over one of said pressure members to move a fruit half from said platform onto said one pressure member; operating means for effecting movement of said one pressure member toward the other pressure member to subject a fruit half to juice extracting pressure; a pair of bars fixed on the frame and extending over and outwardly from said platform with portions thereof on opposite sides of said one pressure member so that said one pressure member is movable between said portions; and guide means operatively connected with said bars for supporting said positioning means for sliding movement between said retracted and extended positions.

3,272,117
BALING MACHINE
William A. Wathen, Detroit, Floyd W. Reuter, Dearborn, and Charles M. Iskenderian, Livonia, Mich., assignors to Massey-Ferguson Inc., Detroit, Mich.
Filed Dec. 11, 1964, Ser. No. 417,591
11 Claims. (Cl. 100—188)



1. A hay baler including a fore-and-aft bale casing, a bale thrower mounted on the rear end of the bale casing for side to side swinging movement, a flywheel for operating the baler, and a drive train connecting said flywheel to said thrower for driving the thrower characterized by said drive train including a flexible drive shaft having one end connected with the thrower for movement therewith relative to the bale casing and its other end supported at a point spaced from the thrower and held against longitudinal and transverse movement relative to the bale casing for transmitting the drive from said flywheel to the thrower in any position of the thrower relative to the bale casing.

3,272,118
ARTICLE MARKING MACHINE
Charles E. Ackley, Oreland, Pa., assignor to R. W. Hartnett Company, Philadelphia, Pa., a corporation of Pennsylvania
Filed Feb. 4, 1965, Ser. No. 430,283
15 Claims. (Cl. 101—37)

1. In an apparatus for printing a plurality of individual objects which are similar in size and shape, the combination which comprises means forming an endless conveyor having an upper run which is upwardly inclined in the direction of its movement, drive means connected to drive said conveyor upper run upwardly, means forming a hopper for said objects surrounding a lower portion of said upper run, carrier means on said upper run arranged to pass through said hopper to seat and to carry said objects angularly upwardly on said conveyor, offset printing means arranged alongside said conveyor including an angularly arranged transfer roll rotatably disposed in an ink reservoir, the axis of rotation of said transfer roll being substantially perpendicular to the path of said upper run and therefore at an angle to the vertical, a printing roll arranged to rotate in contact with said transfer roll and with said objects, in a position to print upon said objects while seated, and means for discharging the printed objects from said conveyor.

3,272,119
AUTOMATIC STAMPING APPARATUS
James G. Keramas, 57 Kilby St., Woburn, Mass.
Filed Nov. 3, 1964, Ser. No. 408,601
11 Claims. (Cl. 101—44)

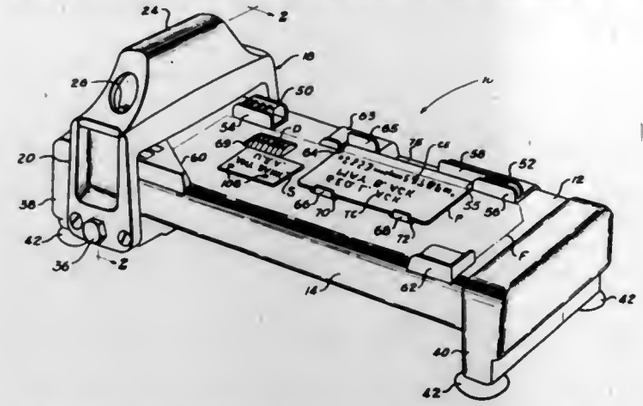
1. Apparatus for automatically stamping coded indicia on a plurality of substantially identical containers, said apparatus comprising;

carrier means movable in a predetermined plane, said means supporting and advancing said containers individually and successively, in aligned, abutting relationship along a path which includes a stamping station;

sensing means mounted along said path and including article actuated means in said path, in advance of said station for sensing the arrival of each successive container at said station;

container clamping means mounted at said station, said means including at least one clamping element movable in a predetermined plane and adapted to engage the adjacent portion of a container at said station;

first power actuated plunger means operably connected to said clamping element and responsive to said sensing means for moving each said element into said path to temporarily halt, and hold down, each successive container at said station, and thereby halt, the abutting containers in rear thereof;



stamping means, mounted below said station, said means including a stamping head bearing said coded indicia, said head being movable in a plane normal to the plane of said carrier means and an ink pad, said indicia and pad being normally in inking engagement outside of said path;

second power actuated plunger means operably connected to said head and responsive to said sensing means for moving said head upwardly into said path to apply said coded indicia to each successive container only after said container has been clamped temporarily halted and held down at said station, and

control circuit means including a source of power, said sensing means, said first plunger means and said second plunger means for energizing each said means in a predetermined sequence.

3,272,120
ADDRESS PRINTING MACHINES WITH ROLLER PLATENS
Dean W. Johnson, Euclid, Ohio, assignor to Addressograph-Multigraph Corporation, Cleveland, Ohio, a corporation of Delaware
Filed Oct. 22, 1964, Ser. No. 405,673
7 Claims. (Cl. 101—56)

1. A printing machine of the character described comprising means for holding a printing device in printing position in a plane; a platen carriage reciprocable adjacent said printing position in a path substantially parallel to the plane of the printing device; two roller platens rotationally supported on said carriage in end-to-end relation with their axes extending transversely of the direction of carriage motion and each movable between an extended position relative to said carriage in which its axis is shifted towards the plane of the printing device and a retracted position relative to said carriage in which its axis is more remote from the plane of the printing device

than said extended position; means for shifting either platen to one or the other of said extended and retracted positions and simultaneuosly shifting the other of said platens to the opposite position; and means adjacent the carriage when the same is at each end of its path for operating said shifting means so that one platen is extended during motion of the carriage in one direction and the other is extended during motion of the carriage in the other direction.

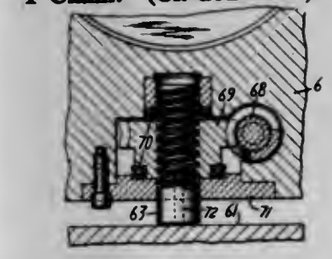
3,272,121
LITHOGRAPHIC PRINTING PLATE PREPARED BY PHOTOELECTROSTATIC REPRODUCTION, A METHOD FOR ITS PRODUCTION AND A METHOD FOR LITHOGRAPHIC PRINTING
Jay J. Uber, South Hadley, Mass., and Shwang Hsia, Newark, Del., assignors to The Plastic Coating Corporation
Filed Feb. 14, 1963, Ser. No. 258,405
12 Claims. (Cl. 101—149.2)

1. A lithographic printing plate comprising:

a base sheet which has dimensions and two opposite edges which adapt the sheet for attachment to the plate cylinder of a lithographic printing press;

a photoelectric film comprising a finely-divided, photoconductive, zinc oxide pigment dispersed in a matrix of a resinous, film-forming material which is inherently hydrophobic in character, covering one surface of the said base sheet;

a hydrophobic, resinous material covering predetermined areas of the said photoelectrostatic film in the form of an image to be reproduced by lithographic printing, leaving exposed areas of the photoelectrostatic film corresponding to the background areas of the image to be reproduced; and



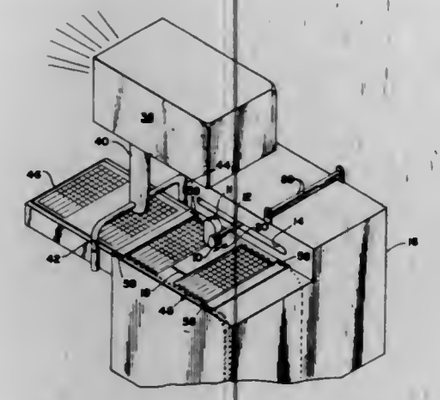
a synergistic combination of a polymeric carboxylic acid selected from the group consisting of polyacrylic acid and polymethacrylic acid, with an inorganic salt selected from the group consisting of alkali metal ferrocyanides and alkali metal ferricyanides bonded to the exposed areas of the photoelectrostatic film, causing the said exposed areas to be hydrophilic in character, while the said resinous material forming the image areas remains hydrophobic in character.

10. A method for lithographic printing which comprises:

attaching to the plate cylinder of an offset printing machine a printing plate described by claim 1, which is adapted by its dimensions and two opposite edges for attachment to that particular cylinder; and

reproducing copies by the use of the said machine while keeping the hydrophilic background areas of the said printing plate wet with an aqueous fountain solution which has dissolved therein a polymeric carboxylic acid selected from the group consisting of polyacrylic acid and polymethacrylic acid and an inorganic salt selected from the group consisting of alkali metal ferrocyanides and alkali metal ferricyanides, and has a pH within the range of about 3.0 to about 7.25.

3,272,122
METHOD OF ADJUSTING A FORESHORTENED IMPRESSION ROLLER
Alfred C. Behringer, Cupsaw Lake, Ringwood, N.J., assignor to Publication Corporation, New York, N.Y., a corporation of New York
Filed Mar. 21, 1961, Ser. No. 97,202
1 Claim. (Cl. 101—426)

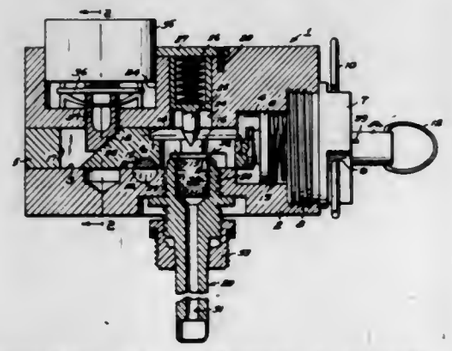


The method of adjusting a roll short at one end relative to a full length cylinder of a printing press so that the roll acts uniformly against a length of the cylinder at one end of the cylinder, said printing press including a pair of end supports for the roll, common drive means for imparting movement to both of said end supports in unison to bring them into engagement with the cylinder, means controlled by said drive means for building up predetermined forces on both said end supports after the roll is brought into engagement with said cylinder, and means for stopping said common drive means when predetermined forces have been built up on both of said end supports to provide uniform pressure engagement between said cylinder and a roll which engages the full length of said cylinder, said method comprising the steps of moving the end supports by said common drive means to bring the short roll into operative engagement with the cylinder until said common drive means is stopped by the application of the predetermined forces on the end supports, and intercepting by interposing a stop in its path of travel the end support at the short end of the roll at the position which the end support would occupy if it carried a full length roll corrected for any difference between the diameter of the said full length and the short roll while permitting the common drive means to operate until the predetermined forces have been built up on both end supports, the full length end of the short roll moving to a position relative to the cylinder determined by the predetermined force transmitted to the respective end support and the short end of the short roll moving to and no further than the position determined by the said stop, thereby obtaining uniform pressure engagement between the short roll and the cylinder.

3,272,123
METHOD OF PRINTING BOWLING GAME SCORES
Ernest C. Webb, Bay Village, Ohio, assignor to Cleveland Trust Company, Cleveland, Ohio, a trustee
Filed Jan. 17, 1964, Ser. No. 338,485
3 Claims. (Cl. 101—426)

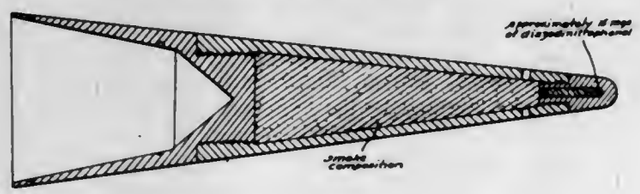
1. A method for printing the frame-to-frame scores achieved in a bowling game, which comprises placing a non-absorbing score sheet formed of material which will

permit light to pass therethrough on top of a rigid plate also formed of material which will permit light to pass therethrough and passing light upwardly through the plate and the score sheet such that printed scores may be viewed thereon, printing the frame-to-frame scores on the score sheet as the game progresses with an ink which remains moist after printing and which is not absorbed by the score sheet, at the completion of a bowling game placing absorbent paper which is characterized in that light will pass therethrough in abutment with said non-absorbing



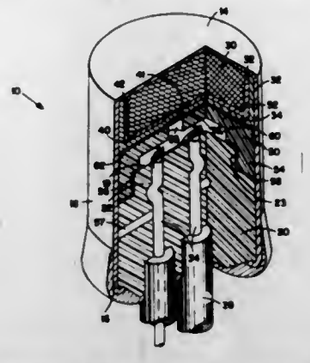
score sheet and pressing the paper against the side of the sheet having printed characters thereon whereby the moist ink will be absorbed by the paper and the printed characters may be viewed in their normal readable configuration by viewing them through the side of the paper opposite that which is pressed against the score sheet, and thereafter wiping the printed characters from the surface of said non-absorbing score sheet after the absorbent paper has been pressed thereagainst whereby the score sheet may be used in a succeeding score printing operation.

3,272,124
SOLID PROPELLANT ACTUATION SYSTEM
John Marsh, Santa Fe Springs, Calif., Girard D. Reid, Battle Creek, Mich., and Donald M. Crose, Sunnyvale, Calif., assignors, by mesne assignments, to Pneumo Dynamics Corporation, Cleveland, Ohio, a corporation of Delaware
Original application Nov. 28, 1960, Ser. No. 72,140. Divided and this application Sept. 27, 1963, Ser. No. 318,469
1 Claim. (Cl. 102—50)



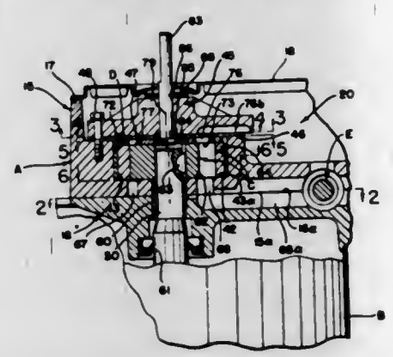
A missile control comprising a generally cylindrical body, a pair of shafts journaled in said body on axes contained in a single plane perpendicular to the axis of said body and which intersect each other perpendicularly, an offset on each shaft at such intersection providing clearance between said shafts, a control surface on each shaft, a pair of double acting piston and cylinder actuators, one of said actuators being associated with one of said shafts and extending parallel to the other of said shafts on the side of said one shaft remote from said other shaft, the other of said actuators being associated with said other shaft and extending parallel to said one shaft on the side of said other shaft remote from said one shaft, four elongated solenoid valves with two connected to each actuator and operable to selectively control the direction of movement of each actuator, said solenoid valves being symmetrically mounted in parallel relationship on said body with two laterally spaced on each side of said one actuator, an arm formed with a spherical end on each offset of each shaft, a lateral centrally located bore in each piston of each actuator closely receiving the spherical end of each arm on the associated shaft whereby axial motion of each piston produces rotation of each shaft about its axis, and a source of fluid under pressure mounted along the axis of said body connected to each solenoid.

3,272,125
THREE-WAY FUZE
Dale Gibson Adams, Sparta, N.J., assignor to the United States of America as represented by the Secretary of the Army
Filed Mar. 17, 1964, Ser. No. 352,694
4 Claims. (Cl. 102—70)



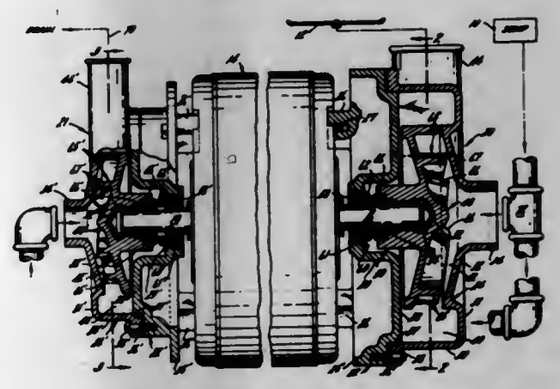
1. A three-way fuze comprising a housing, an extension having a flash passage therethrough and secured to said housing, a detonator in said flash passage, a coupler secured on said extension for attachment of said fuze to a mine, a spring biased firing pin slidable in said housing and disposed in alignment with said detonator, a spring biased piston slidable in said housing between said firing pin and said detonator and disposed normal to said firing pin, said piston extending beyond one side of said housing and being provided with a slotted portion substantially at its medial portion thereof, there being a restriction medially in said slotted portion normally holding said firing pin in a cocked position, and means whereby said fuze may be operated by pressure, pull or release force and associated with said piston whereby said piston is moved in either direction longitudinally to permit said firing pin to snap through on either side of said restriction and fire said detonator.

3,272,126
PYROTECHNIC FUZE SYSTEM
David J. Edelman, Flanders, Seymour M. Kaye, Dover, and Elie L. Barrieres and Garry Weingarten, Morris Plains, N.J., assignors to the United States of America as represented by the Secretary of the Army
Filed Mar. 20, 1964, Ser. No. 353,633
4 Claims. (Cl. 102—70)



1. A pyrotechnic fuze system for an ordnance shell comprising a metal slug containing a charge of diazodinitrophenol and adapted to form a portion of the external surface of said shell, said slug being heated sufficiently by air friction during the flight of said shell to cause ignition of said charge.

3,272,127
IGNITER SQUIB
Robert E. Betts and Nathan P. Williams, Huntsville, Ala., assignors to the United States of America as represented by the Secretary of the Army
Filed Aug. 5, 1963, Ser. No. 300,114
5 Claims. (Cl. 102—70.2)

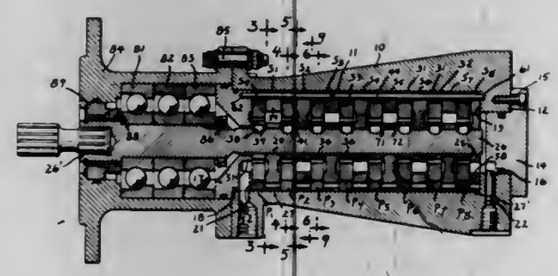


4. An improved igniter squib comprising:
(a) a housing;
(b) a pyrotechnic material disposed in said housing;
(c) a diaphragm mounted in said housing for support of said pyrotechnic material, said diaphragm being cup-shaped and having the wall thereof force fitted with said housing and partially enclosing said pyrotechnic material and provided with a base having a rupturable portion in the form of a dimple disposed therein;
(d) a firing circuit extending into said housing in spaced relation with said diaphragm; and,
(e) a member interposed between said diaphragm and said pyrotechnic material and provided with a bore adjacent said rupturable portion to serve as a die against which said rupturable portion can shear responsive to energization of said firing circuit to concentrate substantially total ignition energy to said pyrotechnic.

3,272,128
VARIABLE VOLUME REVERSIBLE HYDRAULIC DEVICE
Robert W. Brundage, St. Louis, Mo., assignor to The Emerson Electric Company, St. Louis, Mo., a corporation of Missouri
Filed June 15, 1964, Ser. No. 375,193
13 Claims. (Cl. 103—3)

1. In a variable volume hydraulic pump comprised of a plurality of relatively movable members defining a plurality of chambers which revolve about a common center and continuously expand in volume on one side of a neutral axis and continuously contract in volume on the other side of the neutral axis, means defining a plurality of manifold ports separated at the ends by lands, said chambers having openings which move past said lands and consecutively communicate with said manifold ports, the improvement which comprises; said means including a first member fixed relative to said neutral axis and having at least a pair of manifold ports communicating with a portion of said chambers and a second member movable from a maximum volume to a minimum volume position and having at least a manifold port which in the maximum volume position of said second member communicates with another portion of said chambers, said second member manifold port when said second member is moved from said maximum volume position communicating with at least a part of the chambers with which the manifold ports of said first member communicate.

3,272,129
PUMPING SYSTEM AND PUMP THEREFOR
Hugh F. Leopold, Indianapolis, Ind., assignor to Warner Machine Products, Inc., Muncie, Ind., a corporation of Indiana
Filed Dec. 18, 1963, Ser. No. 331,446
6 Claims. (Cl. 103—4)

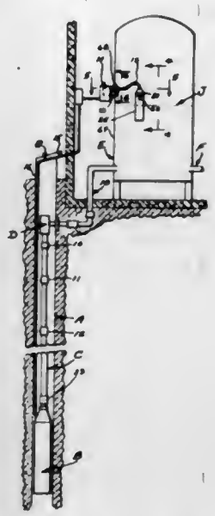


1. In a pumping system for a dishwasher or the like, a reversible motor having a pair of drive shaft ends simultaneously rotatable in the same direction, first and second pumps each having a casing providing a generally circular chamber having an axially oriented inlet and a tangentially oriented outlet, a dam extending inwardly from the circumference of said chamber adjacent said outlet, an impeller connected to one of said drive shaft ends and concentrically disposed within said chamber with its periphery immediately adjacent the inner edge of the dam, said impeller having a plurality of arcuate blades having their inner ends radially spaced from the impeller axis for pumping fluid through said chamber only during rotation of the impeller in a direction to move the outer blade ends past the outlet before said dam, the inlets on said pumps being connected to sump means on said dishwasher or the like and the outlet on said first pump being connected to fluid injection means in said dishwasher or the like and the outlet on said second pump being connected to a drain, said pumps being oppositely oriented with respect to each other whereby upon rotation of the drive shaft ends in one direction said first pump will pump fluid from said sump means to said injection means and said second pump will be inoperative and upon rotation of said drive shaft ends in an opposite direction said second pump will pump fluid from said sump means to said drain and said first pump will remain inoperative.

3,272,130
MULTIPLE STAGE PUMP
Bruce H. Mosbacher, Rockford, Ill., assignor to Roper Industries, Inc., Rockford, Ill., a corporation of Illinois
Filed Mar. 11, 1964, Ser. No. 351,056
12 Claims. (Cl. 103—5)

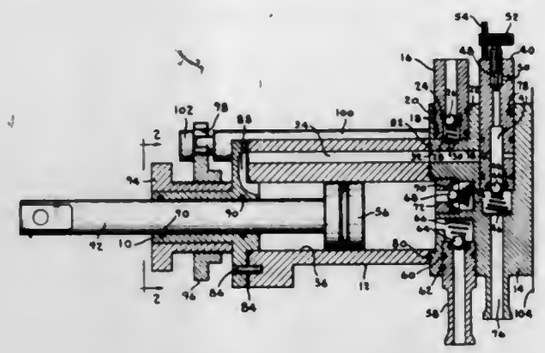
1. A multiple stage positive displacement pump or motor comprising, a plurality of ring members and a plurality of port plates separate from the ring members assembled in a stack with one port plate interleaved between adjacent ones of said ring members, said port plates having axially extending openings therein defining bearings,

a shaft extending through said openings in said plates and rotatably supported by said bearings, said ring members each having an internal wall, pump means disposed in each ring member, said pump means each including a rotor non-rotatably attached to said shaft for rotation therewith about an axis eccentric to the axis of the inner wall of the respective ring member and defining a plurality of segregated pumping chambers which progressively expand in an inlet sector at one side of a plane of eccentricity through the axis of said rotor and the axis of the inner wall of the respective ring member and progressively contract in an outlet sector at the other side of said plane, the ring members being positioned with the axes of the internal walls of successive ring members offset to relatively opposite sides of the axis of the shaft whereby the discharge sectors of alternate pump stages are disposed on relatively opposite sides of said plane of



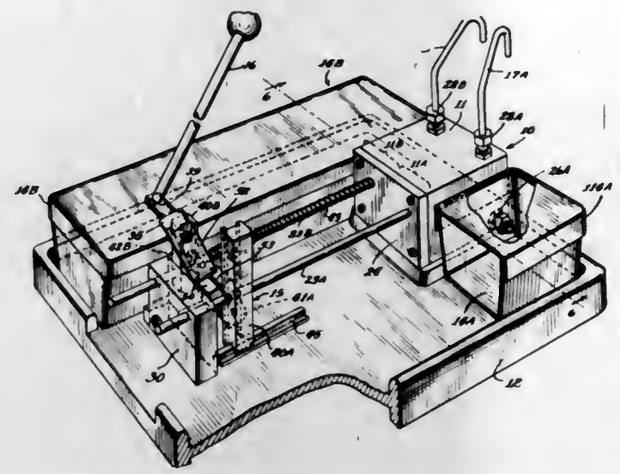
eccentricity to have the radial pressure unbalance on adjacent rotors counteract each other and to position the discharge sector of one stage adjacent the inlet sector of the next succeeding stage, said port plates having port means extending therethrough with the port means in successive port plates being located at opposite sides of said plane of eccentricity and arranged to communicate the outlet sector of one stage with the inlet sector of the next succeeding stage, said port plates having pressure distribution grooves in opposite faces thereof at the side of said plane of eccentricity opposite the port means in the respective port plate, the pressure distribution groove in one face of the port plate being shaped generally complementary to the port means of the preceding stage and the pressure distribution groove in the other face of the port plate being shaped generally complementary to the port means in the next succeeding stage.

3,272,131
WELL SYSTEM
Howard A. Tubbs, 32 Corte Nogel, Danville, Calif.
Filed Apr. 22, 1964, Ser. No. 361,755
7 Claims. (Cl. 103—6)



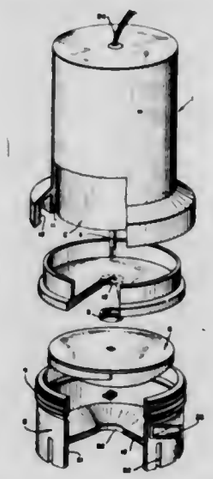
1. A water pumping and storage apparatus comprising: a hollow casing extending down into the ground to the source of water; a water feed pipe within the casing; a water and air storage tank having top, bottom and side walls for receiving the water from the feed pipe, said tank having an inlet in communication with the feed pipe; pumping apparatus for pumping the water from the source through the feed pipe and into the storage tank; means for admitting air into the storage tank during activation of the pumping apparatus and control means for expelling excessive air from the storage tank, said last means including:

a fitting mounted in a side wall of the tank and having an air discharge passage therein; a hollow air discharge conduit having its outer end connected to the fitting and in communication with the air discharge passage; a first valve member disposed within said tank and having a passage in communication with the inner end portion of said conduit; a second valve member disposed within said tank; for coacting with the first valve member; a vertically disposed elongated sleeve disposed within said tank, a float having said second valve member mounted at the upper end thereof and with such float disposed within said



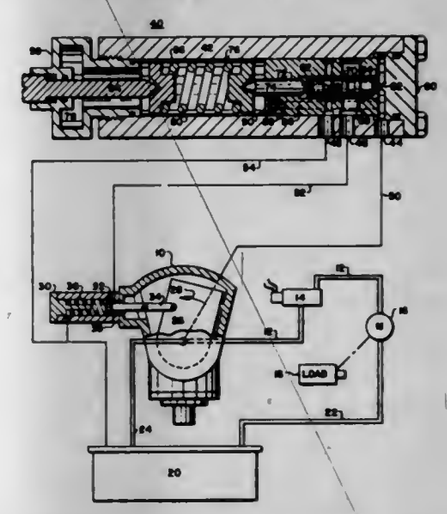
sleeve for vertical movement therein in accordance with the change of water level in the tank, said sleeve being suspended from the inner end of said conduit and limiting the movement of said float and second valve therein.

3,272,132
PUMP
Carl R. Stoelting and Earl M. Stecker, Kiel, Wis., assignors to Stoelting Brothers Company, Kiel, Wis., a corporation of Wisconsin
Filed Aug. 3, 1964, Ser. No. 386,964
4 Claims. (Cl. 103—9)



1. A pump for proportioning air and liquid comprising a housing having a cylinder therein, a piston reciprocable in said cylinder, liquid inlet and outlet means communicating with one side of the piston, air inlet and outlet means communicating with the other side of the piston, check valves in said inlet means and said outlet means, and a bleed valve in the air outlet means upstream of the check valve means associated therewith, each inlet means and the air outlet means comprising a fitting retained in a smooth bore cavity in the housing and provided with a seal, the inner end of each fitting being provided with a valve seat, said housing comprising two principal portions, one portion containing the inlet and outlet fittings and the other portion including the cylinder, seal means between the portions and compression means holding the portions together, the check valve means in the liquid outlet means including a seat assembly in said one housing portion communicating directly with the one end of the cylinder and retained in position by said other housing portion.

3,272,133
PROPORTIONING APPARATUS
Marcel F. Vignerot, 1910 Palmgren Drive, Glenview, Ill.
Filed Apr. 22, 1963, Ser. No. 274,416
3 Claims. (Cl. 103—11)

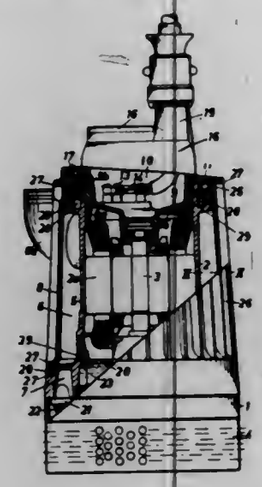


1. In a proportional pumping unit for delivering the components of a resin in predetermined proportions, a pair of piston and cylinder pumps having supply containers associated respectively therewith by check valved inlet connections and having check valved outlet connections, parallel piston rods connected to the respective pumps for operating the same, an operating lever disposed between said piston rods and pivoted on an axis perpendicular to the axes of the piston rods and parallel to and spaced substantially from the plane of said piston rods, cross heads fixed on the respective piston rods and having longitudinal guide grooves therein facing opposite sides of said lever, slide blocks reciprocable in the respective guide grooves of said cross heads, and a pivot pin extending from one side of said lever and connecting one of slide blocks to said lever, an adjusting head disposed on the other side of said lever and having a pivot pin connecting the adjusting head to the other one of said slide blocks, and means for securing said adjusting head in different positions along said lever.

3,272,134
CENTRIFUGAL PUMP
Herbert S. Wilburn, Jr., 707 Glenbrook Road, Fairfax, Va.
Filed Apr. 23, 1964, Ser. No. 362,042
5 Claims. (Cl. 103—25)

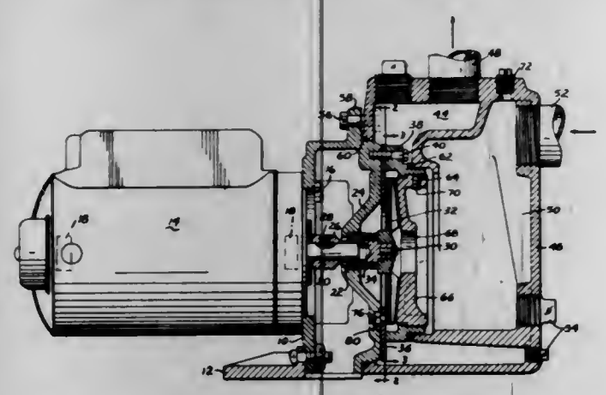
1. A centrifugal pump comprising driving means; a housing for said driving means; a semiopen type impeller formed of a disk having spiral tapered vanes attached thereto, said impeller being connected to said driving means, said impeller vanes spiralling continuously outward from the eye of the impeller through an extent of approximately two and one-half quadrants with a short initial portion of each vane being substantially straight adjacent the eye of the impeller, the distance between two adjacent vanes being substantially equal along the length of each vane from that portion of each vane beyond the first octant of said vane to the outer periphery thereof, and said vanes tapering from a maximum depth at the eye of the impeller to a minimum depth at the outer periphery of the impeller; and a casing surrounding said impeller, said casing having a sloping center portion which conforms closely to the taper of the impeller vanes, said sloping portion defining an inlet opening, and said casing forming an outlet orifice which is substantially rectangular in shape.

3,272,135
POWER TRANSMISSION
James V. Bloomquist, Madison Heights, Mich., assignor to Sperry Rand Corporation, Troy, Mich., a corporation of Delaware
Filed Apr. 5, 1963, Ser. No. 270,945
6 Claims. (Cl. 103—38)



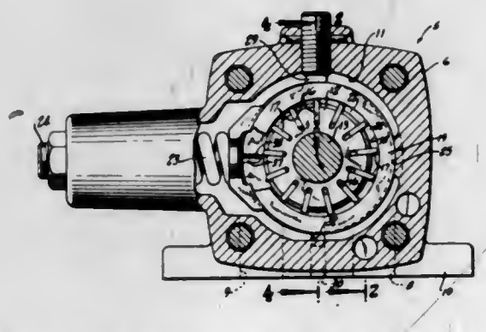
1. In a hydraulic power transmission employing a variable displacement pump having an outlet connected by a pressure conduit to a load, and actuator means for varying the displacement of said pump, control means for said actuator comprising: shiftable valve means for directing fluid to said actuator; resilient means biasing said valve means in one direction; means forming a first area associated with said valve means and exposed to pressure from the outlet of said pump so as to urge said valve in a direction opposite to said one direction; means forming a second area, smaller than said first area, associated with said valve means so as to urge said valve in said one direction in response to pressure thereon; means forming an enclosed chamber, pressure in which is imposed on said second area; continuously open passage means extending between said first area and said chamber and forming the sole means of egress for fluid from said chamber; and a restriction in said passage means.

3,272,136
ROTARY PUMP UNIT
Ingmar Franzen, Hannover-Linden, Germany, assignor to Aktiebolaget Flygts Pumpar, Stockholm, Sweden
Filed Apr. 7, 1964, Ser. No. 357,971
Claims priority, application Germany, Apr. 20, 1963, A 42,926
2 Claims. (Cl. 103—87)



1. In a rotary pump unit having a rotary pump and an electric motor driving said pump, the combination of

an inner housing structure having inner and outer peripheral faces and defining on its interior a motor chamber housing said electric motor, an outer casing structure surrounding said housing and having an inner peripheral face defining with said housing an annular conduit for transmitting the pumped fluid, and sealing means for said structures for protection against explosion comprising top and bottom closures having outer peripheral faces and



closing said structures and pressure-sealing said chambers, some of the outer faces of said closures engaging inner faces of said housing, and inner faces of said casing engaging outer faces of said housing, said closures having axial surfaces disposed opposite axial surfaces of said structures, elastic rings disposed between each two interengaging adjoining inner and outer peripheral faces, and heat conductive thin gaskets disposed between some of said opposite surfaces.

3,272,137
SELF-PRIMING PUMP
John J. Maitlen and William J. Ekey, Ashland, Ohio, assignors to The F. E. Myers & Bro. Co., Ashland, Ohio, a corporation of Ohio
Filed Jan. 20, 1964, Ser. No. 338,952
8 Claims. (Cl. 103—113)

1. In a centrifugal pump; a support bracket, an open faced impeller having its closed side adjacent one face of said bracket, a diffuser secured to said bracket and surrounding the periphery of said impeller and having passages extending outwardly therethrough for pumped liquid, a wear plate on the open side of said impeller adjustably carried by said diffuser for adjustment toward and away from the open side of said impeller and having a central aperture communicating with the central region of said impeller, a pump case secured to said bracket and having an outer region sealed to said bracket and an inner region sealed to said diffuser and having a first larger chamber therein forming a suction chamber and communicating with the aperture in said wear plate and having a second smaller chamber therein forming a discharge chamber and communicating with the region around the periphery of said diffuser, said first chamber extending to a level substantially lower than the said central aperture of said wear plate to form a region for collecting heavy trash in water entering said first chamber.

3,272,138
VARIABLE VOLUME PUMP WITH PROTECTION AGAINST OVERHEATING
Eugene N. Connoy and Richard W. Hoffmann, Minneapolis, James W. Parkin, Burnsville, and Charles H. Whitmore, Savage, Minn., assignors to Continental Machines, Inc., Savage, Minn., a corporation of Minnesota
Filed Feb. 17, 1964, Serial No. 345,238
1 Claim. (Cl. 103—120)

In a variable volume pump of the rotary vane type having

(1) a body with an inlet and outlet, and defining a rotor chamber communicating with the inlet and outlet and having opposite side walls,

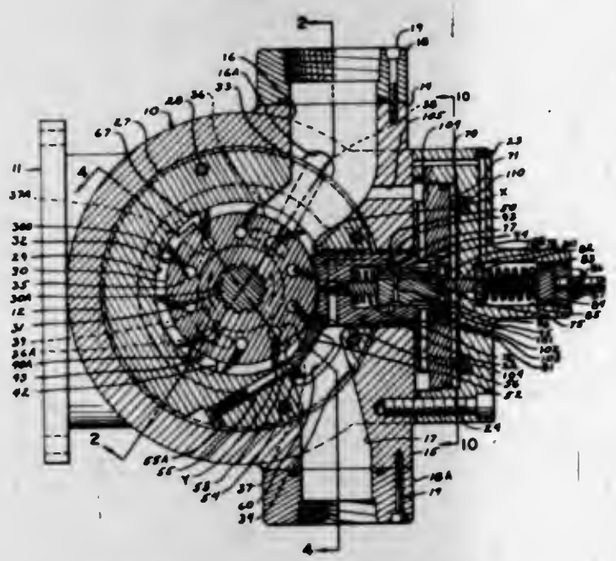
(2) bearing means in the body,

(3) a rotor journalled in said bearing means and confined in the chamber between the side walls thereof, the rotor having vanes slideably projecting from its periphery, and

(4) a ring which encircles the rotor and is shiftable towards and from concentricity with the rotor and coacts with the vanes to provide pumping chambers by which fluid is taken from the inlet, pressurized and delivered to the outlet at a substantially constant pressure but in a volume which varies with the position of the ring, the volume being maximum when the ring is farthest from concentricity and zero when the ring is concentric with the rotor,

so that part of the space inside the ring is at all times communicated with the outlet and during operation of the pump constitutes a pressure zone,

wherein some of the fluid which inevitably leaks from said pressure zone flows to the bearing means to lubricate the same, and



wherein the body also has a drain port at all times in communication with the bearing means and with the outer portion of the rotor chamber that encircles the ring, to receive and carry off fluid which flows through the bearing means and fluid which leaks out of the pressure zone into the outer portion of the rotor chamber,

the improvement which prevents overheating of the pump due to conversion into heat of the energy expended to drive the rotor and maintain the pressure when the volume of fluid delivered by the pump is zero or near zero, and which improvement comprises:

means defining a fluid passage of limited capacity to communicate the pressure zone inside the ring with the outer portion of the rotor chamber and hence with the drain port,

said fluid passage having open communication with the outer portion of the rotor chamber and having its mouth in one of the side walls of the rotor chamber in position to be covered and closed by the adjacent surface of the ring whenever the ring is in any position it occupies when the volume of fluid delivered by the pump through its outlet is sufficient to prevent overheating of the pump and to be uncovered and open when the ring is in the position it occupies when the volume of fluid delivered by the pump is at or near zero.

3,272,139
PUMPS
Oscar E. Rossen, Grosse Pointe, Mich. (1776 E. Nine Mile Road, Hazel Park, Mich.)
Filed Dec. 29, 1964, Ser. No. 439,492
11 Claims. (Cl. 103—120)

1. A variable delivery pump comprising

(a) a casing having a pumping chamber,

(b) a rotor in said chamber and having angularly spaced slidable vanes carried by said rotor,

(c) cam means contacting and guiding said vanes for sliding operation as said rotor turns, said cam means having a fixed portion and a movable portion, and

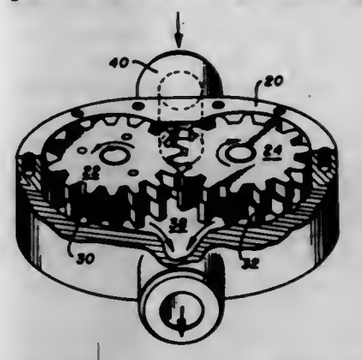
(d) means displacing said movable portion toward and away from said rotor,

(e) said movable cam portion having a laterally extending semi-cylindrical socket at one end,

(f) said cam means includes a ramp section hinged on an axis extending parallel to said rotor axis,

(g) said ramp section having a laterally extending semi-cylindrical end shaped complementary to and engaged in said socket for hinging movement therein, and

(h) means resiliently urging said ramp semi-cylindrical end into said semi-cylindrical socket at all times.

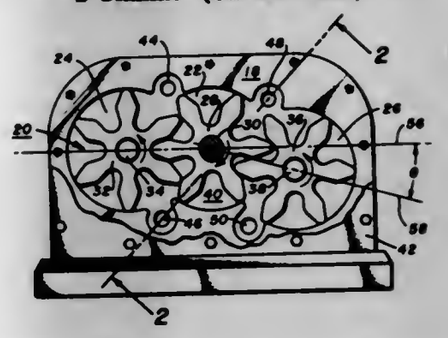


3,272,140
METERING PUMP
Philip E. Curry and Panayotis P. Demopoulos, Pensacola, Fla., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware
Filed Apr. 2, 1964, Ser. No. 356,785
4 Claims. (Cl. 103—126)

1. Pumping apparatus for producing a substantially constant flow, comprising, in combination:

(a) a gear pump housing having an inlet port;

(b) first and second pairs of meshed gears within said housing;



(c) said second pair of gears being so aligned with respect to said first pair of gears that the teeth of the second pair of gears are angularly displaced one-

fourth pitch with respect to the corresponding teeth on said first pair of gears;

(d) and means defining a common discharge port for the output streams of said first and said second pairs of gears.

3,272,141
METERING PUMP
Philip E. Curry and Panayotis P. Demopoulos, Pensacola, Fla., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware
Filed May 13, 1964, Ser. No. 367,071
2 Claims. (Cl. 103—126)

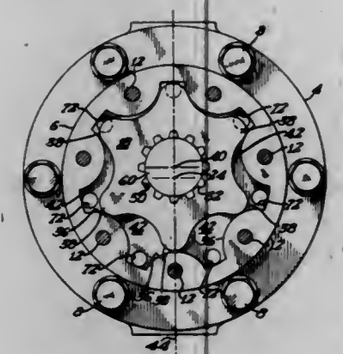
1. Pumping apparatus for producing a substantially constant flow comprising in combination:

(a) a pump housing, and

(b) meshed gears within said housing, said meshed gears consisting of a central spur gear and first and second further spur gears, each of said further gears meshing with said central gear to form respectively first and second meshed regions,

(c) a three-gear positive displacement pump wherein the offset angle defined by the gears equals

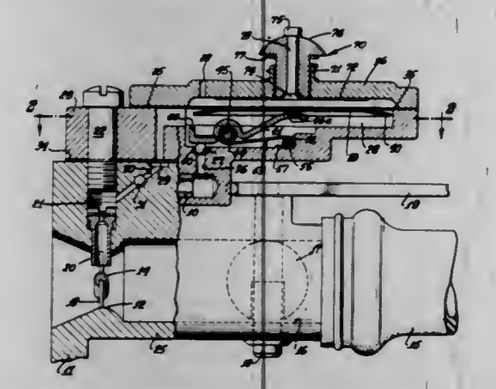
$$(90/n)(4K+1)$$



degrees, when n equals the number of teeth on the central gear and K equals an integer, each of said gears being a spur gear,

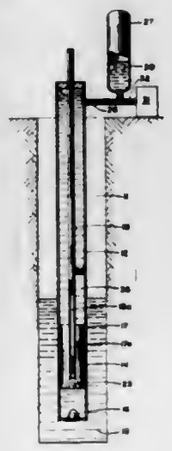
(d) and said housing forming with said gears a positive displacement pump with a single output stream.

3,272,142
PORTING AND PASSAGE ARRANGEMENT FOR FLUID PRESSURE DEVICE
Wayne B. Easton, South Bend, Ind., assignor to Char-Lynn Company, Minneapolis, Minn., a corporation of Minnesota
Filed Aug. 13, 1965, Ser. No. 479,424
12 Claims. (Cl. 103—130)



1. In a fluid pressure device, a casing, an internally toothed ring member defining the outer wall of a chamber, a cooperating externally toothed star member having fewer teeth than said ring member disposed eccentrically in said chamber, one of said members having orbital

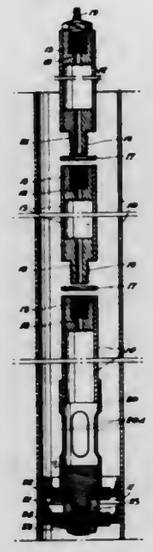
movement about the axis of the other of said members and one of said members having rotational movement about its own axis, the teeth of said members intermeshing in sealing engagement to form expanding cells on one side of the line of eccentricity between said members and contracting cells on the other side of said line during relative movement between said members, a valve rotatably disposed in said casing, drive means operatively connecting said valve to one of said members for rotation of said valve in synchronism with one of said movements of one of said members, said casing and said valve having mutually engaging plane surfaces, fluid inlet and outlet



passages extending from the exterior of said casing to said plane surface of said casing, passage means in said casing which form circumferentially spaced openings in said plane surface of said casing and extend therefrom to said ring member chamber for communication with said cells, fluid feeding and exhausting recess means in said plane surface of said valve having constant communication respectively with said fluid inlet and outlet passages, said valve recess means upon relative movement between said valve and casing being sequentially communicable with each of said casing passages to effect communication between said inlet ports and the expanding cells on one side of said line of eccentricity and between said outlet port and said contracting cells on the other side of said line of eccentricity.

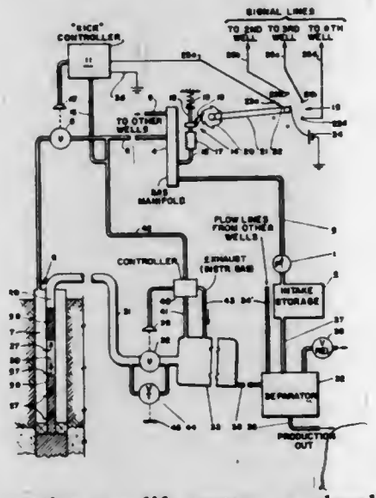
3,272,143
DEMAND FUEL REGULATOR AND PRIMING PUMP
Henry T. M. Rice, San Gabriel, Calif., assignor to Ohlsson & Rice, Inc., Los Angeles, Calif., a corporation of California
Filed May 20, 1963, Ser. No. 281,438
11 Claims. (Cl. 103—150)

1. In a fuel regulator and priming pump: housing means having a chamber therein provided with an inlet passage and a single outlet passage; an inlet valve controlling flow of fuel from said inlet passage into said chamber; a discharge valve controlling flow of fluid from said chamber into said outlet passage; valve actuating means engaging said inlet valve and urging said inlet valve to closed position; diaphragm means secured to said housing means across said chamber and engageable with said valve actuating means to shift said valve actuating means in response to the pressure in said chamber to control opening of said inlet valve; said diaphragm means being constructed and arranged to shift in said housing in a direction to draw fuel from said inlet passage past said inlet valve into said chamber; and means engageable with said diaphragm means for reciprocating said diaphragm means in said chamber to alternately enable said discharge valve to close and draw fuel from said inlet passage past said inlet valve into said chamber and enable said inlet valve to close and discharge fuel from said chamber past said discharge valve into said outlet passage.



3,272,144
WELL PUMP
Renic P. Vincent, Tulsa, Okla., assignor to Pan American Petroleum Corporation, Tulsa, Okla., a corporation of Delaware
Filed July 31, 1964, Ser. No. 386,659
4 Claims. (Cl. 103—204)

1. A reciprocating pump for pumping fluid from a well which comprises:
(a) a vertical first conduit suspended within said well;
(b) a pump cylinder connected to the lower end of said first conduit;
(c) a string of hollow sucker rods suspended within said first conduit;
(d) a plunger connected to said string of hollow sucker rods and reciprocally mounted within said cylinder in sealing engagement with the interior surface of said pump cylinder,
said plunger having a second conduit therethrough and a check valve means in said second conduit permitting flow only from beneath said plunger upwardly through said second conduit, said second conduit being in fluid communication with the interior of said string of hollow sucker rods,
said plunger forming a barrier between said second conduit and a protective fluid reservoir formed above the plunger within said first conduit and exterior of said string of hollow sucker rods so as to prevent fluid communication between the reservoir and the second conduit;
(e) an inlet means in said cylinder below said plunger communicating said cylinder with said well for admitting well fluid into said cylinder, said inlet means including a check valve means for unidirectional flow of fluid from the well into said cylinder;
(f) a column of protective fluid contained in the protective fluid reservoir formed in said first conduit exterior of said string of sucker rods and above said plunger, and



(g) means for maintaining the lower end of said column of protective fluid above said plunger at a pressure greater than the maximum fluid pressure in said cylinder below said plunger.

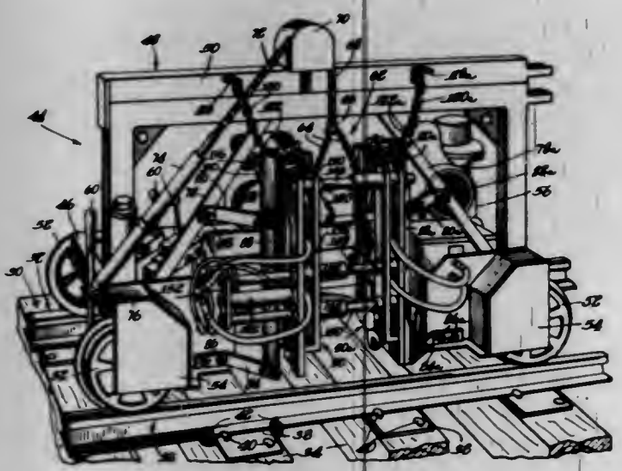
3,272,145
BORE PUMPS
Gresley Lukin Towner, Tooloon, Charleville, Queensland, Australia
Filed Oct. 22, 1964, Ser. No. 405,768
2 Claims. (Cl. 103—224)

1. A reciprocating bore pump having a casing, a pump plunger within said casing, a hollow pump rod for reciprocating said plunger, the interior of said rod forming an air chamber open to the water pressure immediately above said plunger and extending continuously to the surface of said bore, a non-return air valve closing the upper end of said chamber and means for attaching a source of compressed air to said valve to recharge said chamber.

3,272,146
ROTATIVE GAS LIFT SYSTEM
John D. Bennett, Richardson, and John W. Peret, Dallas, Tex., assignors to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Filed Feb. 13, 1964, Ser. No. 344,704
21 Claims. (Cl. 103—232)

1. In a rotative gas lift system, a plurality of wells each having therein gas lift devices to which compressed gas may be supplied to lift well fluids to the surface; a single source of compressed gas, a separate coupling between the gas lift devices of each respective well and said source, a separate control valve in each respective coupling, and means responsive to variations in pressure of said source for causing the opening of said control valves one at a time and in a predetermined sequence, the arrangement being such that each respective control valve is closed prior to the opening of the valve immediately following in the sequence..

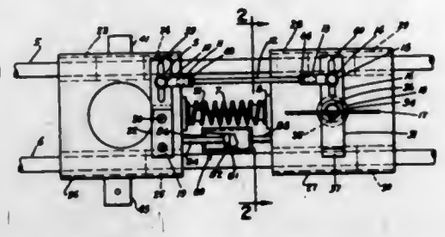
3,272,147
CART SYSTEM FOR FOUNDRIES OR THE LIKE
Henry J. Cakora, Pekin, Ill., assignor to Tazewell Machine Works, Inc., Pekin, Ill., a corporation of Illinois
Filed May 11, 1964, Ser. No. 366,528
14 Claims. (Cl. 104—1)



1. In a cart system for foundries or the like,
the combination comprising a pair of parallel wide gauge rails,
a pair of parallel narrow gauge rails disposed centrally between said wide gauge rails,
said wide and narrow gauge rails being at substantially the same elevation,
a plurality of carts,
each cart having a pair of wheel-supporting arms mounted thereon for swinging movement between retracted and extended positions,
a plurality of wide gauge wheels mounted on said arms and engageable with said wide gauge rails,
said arms projecting downwardly and outwardly from said cart when said arms are in said extended position to locate said wide gauge wheels opposite said wide gauge rails,
a plurality of narrow gauge wheels mounted on each cart and engageable with said narrow gauge rails,
said wide gauge wheels being at a substantially lower elevation than said narrow gauge wheels when said arms are extended,
a tiltable member at one end of said wide gauge rails and including a pair of narrow gauge rail sections at a higher elevation than said wide and narrow gauge rails,
said tiltable member being swingable in one direction to move said narrow gauge rail sections upwardly under said narrow gauge wheels so as to raise said cart off said wide gauge rails,
spring means on each cart for moving said arms to said retracted position when the weight of the cart is removed from said wide gauge wheels,
said wide gauge wheels being swung upwardly and inwardly under the cart when said arms are retracted so that said narrow gauge wheels will project below said wide gauge wheels,
said tiltable member being swingable in the opposite direction to move said narrow gauge rail sections downwardly opposite said narrow gauge rails for directing the cart onto said narrow gauge rails,
the cart on said wide gauge rails being raised above said narrow gauge rails by said arms and thereby affording room under said cart for the passage of another cart on said narrow gauge rails,
inbound carts on said narrow gauge rails thereby being able to pass under outbound carts on said wide gauge rails,
means forming a pair of eyes on said arms for use in lifting said carts,

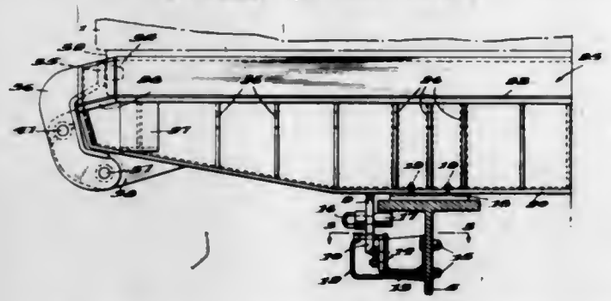
and a lifting device at the opposite end of said rails and including hooks for engaging said eyes and lifting the cart,

the weight of the cart thereupon being effective to swing said arms outwardly to their extended positions to locate said wide gauge wheels for reengagement with said wide gauge rails.



3,272,148
RAIL ANCHOR APPLYING MACHINE
William P. McIlrath, Racine, Wis., assignor to Racine Hydraulics & Machinery, Inc., Racine, Wis., a corporation of Wisconsin
Filed July 30, 1963, Ser. No. 298,617
9 Claims. (Cl. 104—2)

1. In a machine for applying rail anchors, the combination comprising a frame, a plurality of wheels rotatably mounted on said frame for transporting said machine on a railroad track, rail anchor applicator means, means on said frame for moving said applicator means between lowered anchor applying position and raised traveling position, and guide means on said frame comprising a pair of substantially vertical guide members spaced longitudinally of a rail for guiding said applicator means between raised and lowered position, said applicator means having guide means cooperable with and movable away from the guide members of the guide means on said frame, said applicator means comprising a pair of like rail anchor positioning members spaced longitudinally of a rail to embrace a tie with said applicator means in lowered position, power means acting between said anchor positioning members to move said members toward one another and respectively away from said guide means and thereby to press prepositioned rail anchors against the opposite sides of a tie, said applicator means further having presser means engageable with prepositioned rail anchors and movable transversely of a rail to force said anchors into installed position.

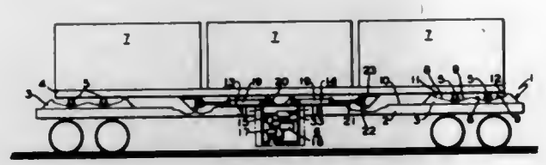


3,272,149
INERTIA COMPENSATING CONVEYOR
Robert L. Crane, Hopkins, Minn., assignor, by mesne assignments, to Eastman Kodak Company
Filed May 14, 1964, Ser. No. 367,344
13 Claims. (Cl. 104—173)

1. A product conveyor on which products are transported from one point to another comprising, at least a first and second movable member adapted to travel in similar paths, means for driving said first and second movable members so that they accelerate and decelerate differently from each other whereby the distance between them varies in proportion to their relative rates of acceleration or deceleration, a product platform means movably mounted on one of said first and second movable members, and linkage means operatively attached between said product platform means and the other of said first and second movable members for moving said product platform means as the distance between said first and

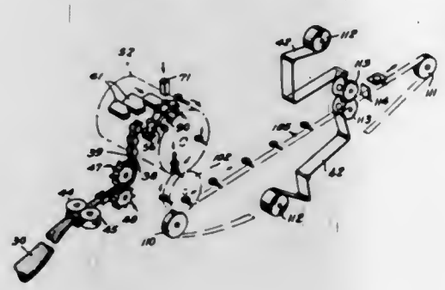
second movable members varies whereby a reaction force is applied to any products resting on said product platform means which opposes any force tending to move the products relative to said product platform means.

3,272,150
FREIGHT TRANSPORTATION SYSTEM
James W. Dempster and Steven C. Voorhees, Knoxville, Tenn., assignors to Dempster Brothers, Inc., Knoxville, Tenn., a corporation of Tennessee
Continuation of application Ser. No. 285,037, June 3, 1963. This application Aug. 18, 1965, Ser. No. 483,015
6 Claims. (Cl. 105—366)



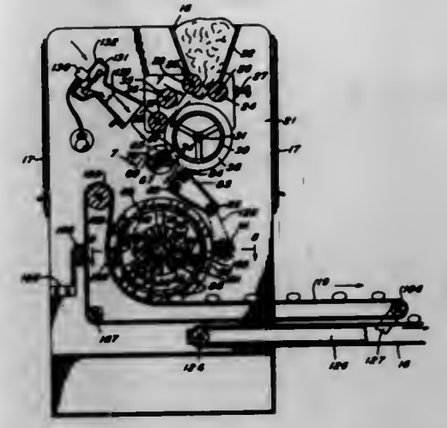
1. A bolster for a freight transporting system, comprising an elongated member having a seat extending lengthwise substantially throughout the length thereof and open at the ends of the bolster adapted to receive a container in supported position on the seat, abutment means connected with the elongated member for maintaining the container on the seat, and a hold-down device for the container and mounted on the end of said bolster, said device comprising a plate extending edgewise of the bolster underneath said end portion and projecting outwardly at the end of the bolster, a member extending from a position beneath the bolster upwardly around the end of the bolster to a position above said end, said member having portions straddling the plate, a hinge pin extending through said portions of the member and through the plate at a point beneath the end of the bolster, a lock pin extending through the plate and said portions of the member, and means on the upper end of the member fixed rigidly thereto and movable into interengagement with the container upon raising movement of the member to hold the container on the seat.

3,272,151
RAILWAY CAR BODY MOUNTING ARRANGEMENT
George K. Newell, Penn Township, Westmoreland County, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Filed July 17, 1964, Ser. No. 383,366
6 Claims. (Cl. 105—392.5)



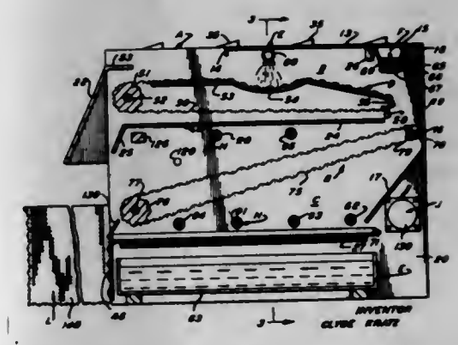
1. A vehicle body mounting arrangement for absorbing impact energy to protect lading therein, comprising:
(a) a vehicle body,
(b) means for carrying cargo,

(c) guide means on said body extending longitudinally of the forward and reverse directions of travel of said body, and having at least portions thereof inclined with respect to the direction of travel, the inclined portions being linear and intersecting at their lower points comprising stop means,
(d) means on said first named means engageable with said guide means and normally positioned by the weight of the first named means at said low point of said inclined portions and movable along the inclined portions for providing a component of gravity



as a retarding force for relative movement between said body and said first named means when said body is accelerated, and
(e) means operable to provide a predetermined force for opposing the weight of the cargo carrying means for retarding movement of said cargo carrying means down said inclined portions to limit the force of impact of said means engageable with said guide means with said stop means to a value less than a cargo damaging impact force when relative movement between said vehicle and said cargo carrying means has ceased after an acceleration of said vehicle body.

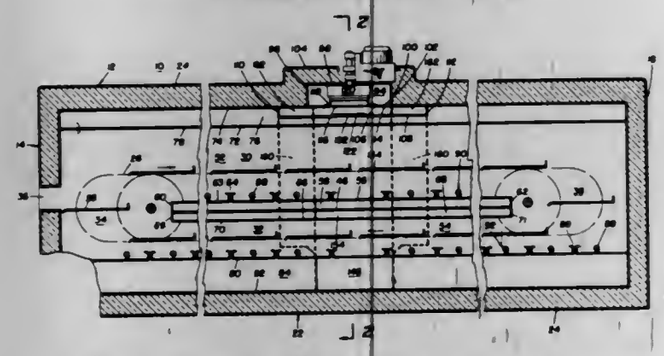
3,272,152
APPARATUS FOR MAKING AND WRAPPING SOFT-CENTER CANDY SUCKERS
Shafter L. Williams, 1511 Myrtle Ave., Chesapeake, Va.
Filed Aug. 30, 1963, Ser. No. 305,682
10 Claims. (Cl. 107—4)



1. Apparatus for making soft-center candy suckers, comprising
(a) means for engaging an advancing candy rope and progressively pinching it transversely at successive intervals to form pillow-shaped sections connected in series by attenuated fins, said engaging means comprising a pair of cooperating wheels having blunted teeth meshing face to face but not touching, and means for rotating said wheels in opposite directions, said candy rope being fed into the nip of said wheels,
(b) means for engaging successive fins and pinching the ends toward each other to a degree which ultimately severs each fin,
(c) means adapted to engage successive separated sections and mold them to desired contour,
(d) means for inserting a stick into each section, and
(e) mechanism for driving the foregoing means (a)–(d) in predetermined timed relation.

3,272,153
DOUGH DIVIDER
Anthony P. Morabito, % Topos Mondial Corp., 755 Kohn St., Norristown, Pa.
Filed Dec. 20, 1963, Ser. No. 332,096
10 Claims. (Cl. 107—4)

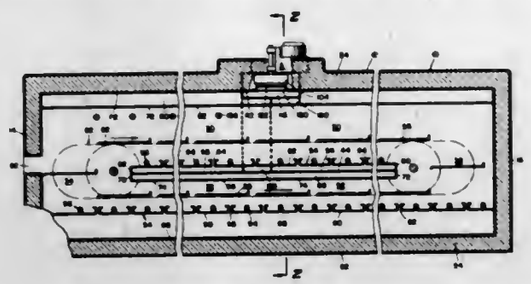
1. A dough divider comprising a housing, a dough hopper in said housing, a rotatably mounted dough feed drum having a plurality of circumferential flanges for separating dough from said hopper into a plurality of strips, a rotatable cutter member having a plurality of spaced blades thereon movable toward said drum into cutting engagement with the dough in said strips, a horizontally disposed rotatably mounted dough receiving drum having a plurality of dough receiving cells in the periphery thereof, an agitating drum in said dough receiving drum and movable with respect thereto for moving the dough in said cells, members for guiding the dough into said cells, and a belt having a portion in peripheral engagement with a portion of said dough receiving drum for closing said cells during a portion of their travel and for discharge of dough pieces from said cells.



3,272,154
COMPACT SELF-UNLOADING BAKING OVEN
Clyde Kratz, Norristown, Pa., assignor to K & N Soft Pretzel Company, Inc., Norristown, Pa., a corporation of Pennsylvania
Filed Sept. 9, 1964, Ser. No. 395,155
10 Claims. (Cl. 107—4)

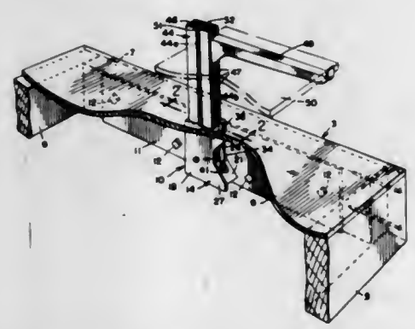
1. A self-unloading food baking oven comprising a longitudinally extending housing; a transverse plate dividing the interior of the housing into a proving zone and a baking zone; a first longitudinal conveyor in the proving zone adapted to carry products placed thereupon through said proving zone; means in said proving zone for spraying products on said first conveyor with caustic; means in said proving zone for depositing salt on products as they leave the proving zone; a second longitudinal conveyor in the baking zone adapted to carry products placed thereupon through said baking zone and aligned

with said first conveyor so as to effect transfer of products from one to another; said first conveyor being loaded proximate the front of said housing and said second conveyor automatically discharging proximate the front of said housing; and heating means within said baking zone to supply heat thereto as well as to said proving zone.



3,272,155
OVEN HEATING SYSTEM
Wayne H. Royer, York, Pa., assignor to Read Corporation, York, Pa., a corporation of Delaware
Filed Sept. 18, 1963, Ser. No. 309,814
15 Claims. (Cl. 107—55)

1. In an air circulating system for an oven provided with an endless traveling tray conveyor for transporting products to be baked therethrough in an upper and a lower longitudinally extending run,
an imperforate horizontal partition between said upper and lower tray conveyor runs extending from one side of the other of the oven to provide therein an upper and a lower baking chamber,
perforate horizontal partitions above and below said upper tray conveyor run providing in said upper baking chamber an upper and a lower plenum chamber,
perforate horizontal partitions above and below said lower tray conveyor run providing in said lower baking chamber an upper and a lower plenum chamber,
a blower,
first blowing duct means communicating with the discharge side of said blower and the lower plenum chamber of said upper baking chamber,
means providing communication between the intake side of said blower and the upper plenum chamber of said upper baking chamber,
second blowing duct means communicating with the discharge side of said blower,
intake duct means communicating with the intake side of said blower,
and damper controlled connecting duct means selectively providing communication between either of said second blowing or intake duct means with one or the other of said upper or lower plenum chambers of said lower baking chamber.

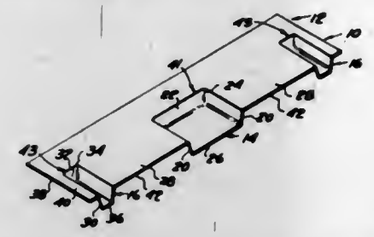


3,272,156
OVEN HEATING SYSTEM
William H. Gilgore, Hellam, and Wayne H. Royer, York, Pa., assignors to Read Corporation, a corporation of Delaware
Filed Jan. 31, 1964, Ser. No. 341,555
9 Claims. (Cl. 107—57)

1. In an air circulating system for an oven provided with an endless conveyor having a horizontal product carrying run, walls forming rectangular shallow upper and lower plenum chambers in spaced relation above and below said product carrying run,
the walls of said chambers facing said product carrying run having a multiplicity of air openings directed toward said product carrying run,
fan means,
discharge duct means communicating with the discharge of said fan means,
collecting duct means communicating with the intake of said fan means,
a pair of duct means communicating respectively with said upper and lower plenum chambers, and
valve means associated with said pair of duct means operative between first and second positions for se-

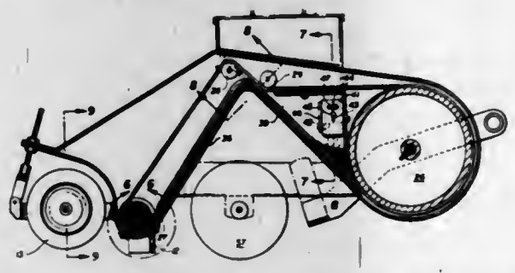
lectively providing communication between one of said pair of duct means and said discharge duct means and between the other of said pair of duct means and said collecting duct means in said first position of said valve means, and between the said one of said pair of duct means and said collecting duct means and between the said other of said pair of duct means and said discharge duct means in said second position of said valve means.

3,272,157
CLAMP STRUCTURES AND DISPLAY UNITS EMBODYING SAME
Henry S. Peacock and Charles P. Durham, Lincoln, Ill., assignors to Swain & Myers, Inc., Decatur, Ill., a corporation of Delaware
Filed May 10, 1965, Ser. No. 454,526
6 Claims. (Cl. 108—28)



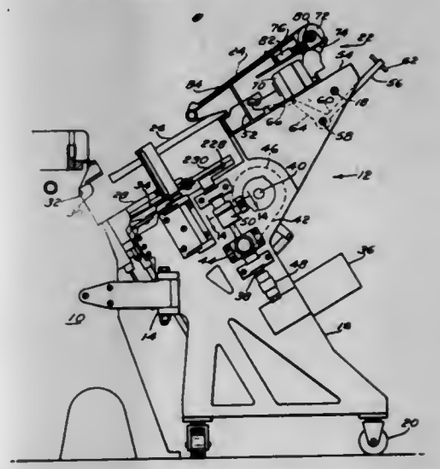
1. A clamp comprising side walls defining a socket open at a longitudinal end thereof and adapted to receive a rod-like member through said end, one of said side walls embodying a pair of longitudinally spaced, converging, oppositely facing, clamping jaw guides, a clamping jaw slidably mounted on each of said guides, and means for drawing said jaws toward each other to cause said jaws to slide on their respective, converging guides and thereby move said jaws into said socket against a rod-like member to be clamped in said socket.

3,272,158
MOLDED PALLET
Leslie F. Barnum, 19345 Keating St., Detroit, Mich.
Filed June 16, 1964, Ser. No. 375,448
4 Claims. (Cl. 108—51)



1. A molded pallet, comprising
a plate-shaped base having therein a plurality of sets of substantially rectangular openings disposed in laterally-spaced parallel relationship to one another,

each set containing a plurality of such openings spaced longitudinally apart from one another and a plurality of sets of open-topped box-shaped feet of substantially equal height secured at their tops 2 and depending from said base directly beneath said openings, said tops of said feet being of sizes and shapes substantially corresponding to the sizes and shapes of said openings,
said sets being disposed in laterally-spaced parallel relationship,
each set including a plurality of said feet disposed substantially in alignment with one another in longitudinally-spaced relationship,

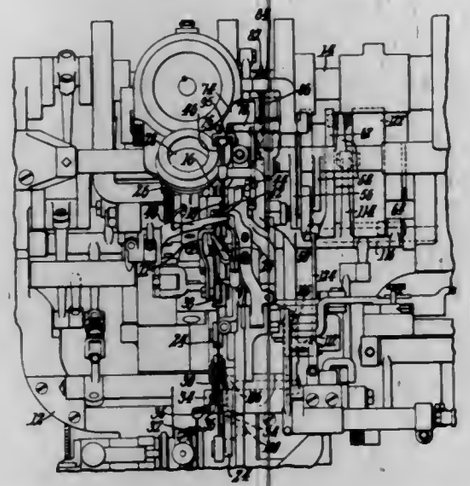


each foot including opposite side walls and end walls and a bottom wall connected to one another along their adjacent edges,
said base including lateral bridge portions disposed in the space between the feet of each set,
said lateral bridge portions extending between the upper edges of the side walls of adjacent feet,
said base also having longitudinal bridge portions extending between the end walls of the feet in each set thereof, said base along opposite edges of said openings having flaps extending downwardly therefrom into secured engagement with walls of their respective adjacent feet, said feet along opposite upper edges having horizontally-extending edge tabs secured to said base.

3,272,159
FARM IMPLEMENT FOR SEEDING
Martin I. Sanderson, 132 Grove St., Salinas, Calif.
Filed Feb. 19, 1965, Ser. No. 433,970
16 Claims. (Cl. 111—71)

1. A farming implement for planting seeds individually in a field-row comprising a frame adapted to move along said row, a flexible seed carrier belt formed with spaced seed-receiving holes distributed along the length thereof, the holes extending from one face of the belt to the other, means on the frame supporting said belt in a cyclic path lying in an upstanding plane, said path including a seed-carrying run and a return run, the seed carrying run being disposed to maintain the axis of each hole in a generally upwardly direction to retain seed therein, said seed carrying run including a seed-receiving reach, said seed-carrying run further including a seed-delivery reach terminating at a delivery disposition closely adjacent ground level, means for guiding said belt to carry those ends of the holes which constitute the bottom ends thereof during said seed-carrying run to pass nearest to the ground at said delivery disposition to deliver seed from the bottom of each hole to the ground beneath, seed retaining means underlying the seeds in said belt during said seed-receiving and seed-delivering reaches to retain seeds in said holes of the belt, a charging hopper adapted to contain seed overlying said receiving reach, said receiving reach passing in cooperative relation to said hopper to acquire seed in the holes of said belt, said seed retaining means serving to open each hole sufficiently at said delivery disposition to release the seed to fall from the belt.

3,272,160
AUTOMATIC FEED APPARATUS FOR BOOKSEWING MACHINE
John H. Atkins, Lexington, and George A. Wood, Jr., Lincoln, Mass., assignors, by direct and mesne assignments, to Oversewing Machine Company of America, Medford, Mass., a corporation of Massachusetts
Filed Jan. 31, 1964, Ser. No. 341,501
8 Claims. (Cl. 112—21)

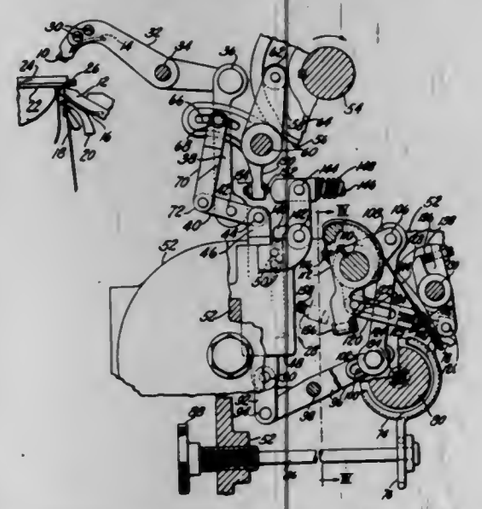


1. An apparatus for feeding signatures into a book sewing machine and for unloading sewn books therefrom, comprising
(a) a frame adapted to be connected to said sewing machine,
(b) a conveyor mounted on said frame for holding signatures placed thereon,
(c) a signature shelf mounted below said conveyor and adapted to receive individual signatures delivered by said conveyor,
(d) a retractable stop mounted at the outer end of said signature shelf,
(e) a pusher movably mounted to said signature shelf and adapted to advance signatures individually into said sewing machine,
(f) a movable bookshelf adapted to accumulate signatures fed thereon and clamp them in position for sewing,
(g) said bookshelf being adapted to lower itself to receive each new signature and to rise again into a clamping position,
(h) book and signature centering means including guide arms adapted to move up and down the said bookshelf,
(i) a hinged book table spaced below said bookshelf and adapted normally to move up and down therewith,
(j) one portion of said bookshelf having a sharp inner edge being adapted to swing out and away from said sewing machine to permit a fully sewn book to drop onto said table, to then rise and swing back to a closed position to cut the book threads,
(k) a finger mounted on said signature shelf adapted to extend down against said book and to pull said book from the other portion of said bookshelf, and
(l) means for first lifting said table when said bookshelf closes, then swinging said table down to unload said book and then return said table to a starting position.

3,272,161
PRESSER FOOT ACTUATING MECHANISMS FOR SEWING MACHINES

Otto R. Haas, Wenham, Mass., assignor to United Shoe Machinery Corporation, Boston, Mass., a corporation of New Jersey

Filed Sept. 16, 1963, Ser. No. 309,018
11 Claims. (Cl. 112—38)

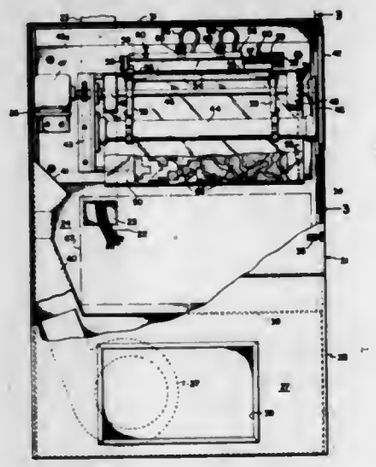


1. A sewing machine having a frame, stitch forming devices in the frame, a main sewing shaft for actuating the stitch forming devices, a work support, a presser foot and mechanism for actuating the presser foot to clamp and release the work supported on the work support, including a presser foot lever, a presser foot cam on the sewing shaft, a follower engaging the presser foot cam, and a train of adjustable connections between the follower and the presser foot lever, in combination with a feeler arranged to engage the work between the work support and the presser foot for changing the adjustment of the connections between the follower and the presser foot levers as the thickness of the work varies between successive stitches.

3,272,162
PRESSER FOOT MECHANISMS

Joseph R. Ioannilli, Beverly, and Roger E. Lemay, West Peabody, Mass., assignors to United Shoe Machinery Corporation, Boston, Mass., a corporation of New Jersey

Filed Apr. 23, 1964, Ser. No. 361,961
5 Claims. (Cl. 112—61)



1. A sewing machine comprising a curved hook needle, a work support upon which a work piece having a thickness within a predetermined range of work thicknesses is supported while being penetrated by the needle, a presser foot for gripping the work piece against the work support, a torsion spring producing a torque output proportional to work thickness, a lock releasable during a portion of each sewing cycle for permitting the presser foot to be urged toward the work support under a force from the spring and interconnecting means for translating the torque output of the spring into a relatively constant force applied to the presser foot throughout the range of work piece thickness.

3,272,163
PATTERN CONTROL FOR TUFTING MACHINE ATTACHMENTS

Joseph Otis Erwin, Jr., Hixson, and Wallace Wesley Hammel, Jr., Chattanooga, Tenn., assignors to The Singer Company, New York, N.Y., a corporation of New Jersey

Filed May 6, 1964, Ser. No. 365,334
9 Claims. (Cl. 112—79)

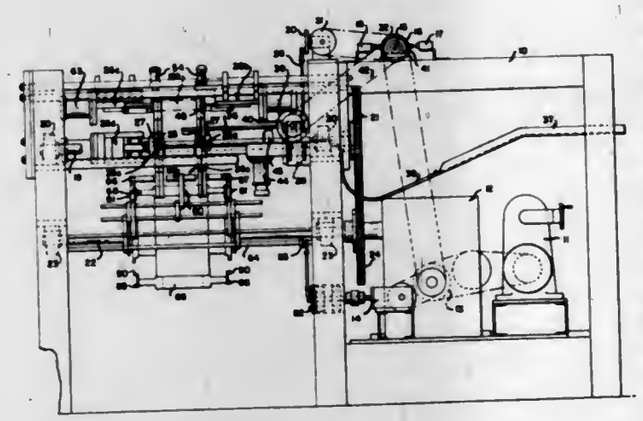
1. In a tufting machine having a pattern controlled yarn feeding mechanism for feeding yarn at different rates to the individual needles of the tufting machine and comprising an electrically-actuated control means for controlling the rate of yarn feed and a pattern mechanism for actuating said control means, said pattern mechanism comprising a console remote from the machine, a shaft journaled in said console, means electrically connected to the machine for driving said shaft in synchronism with the operation of the tufting machine, a pattern element comprising an endless belt of flexible transparent material means for mounting said belt in said console for advancing said belt endlessly and for flexing said belt longitudinally as it is advanced, means coupling said belt to said shaft for advancing said belt in timed relation with said shaft upon rotation of said shaft, said belt having opaque areas defining a desired pattern, photoelectric means disposed in operative relation with respect to said belt to respond to light transmitted through the transparent areas of said belt, and means electrically connecting said photoelectric means to said control means for actuation of said control means by said photoelectric means as the transparent and opaque areas of said belt are moved into operative relation with said photoelectric means.

3,272,164
LUBRICATING SYSTEMS FOR SEWING MACHINES

George F. Keller, Mountain Lakes, N.J., assignor to The Singer Company, New York, N.Y., a corporation of New Jersey

Filed Feb. 12, 1965, Ser. No. 432,223
3 Claims. (Cl. 112—256)

1. A lubricating system for a sewing machine having a frame, an oil reservoir in said frame, a rotating shaft having an axial bore mounted in said frame, a loop taker connected to the rotating shaft, said loop taker including a stationary member having a bearing surface and a rotary member having a bearing surface mating with the bearing surface of the stationary member and a conduit communicating with the axial bore in the rotating shaft and extending to the bearing surface of the rotary member for transmitting oil to said bearing surface, said lubricating system comprising a stationary capillary tube for oil mounted in the bore in the rotating shaft and communicating with the conduit in the rotary member of the

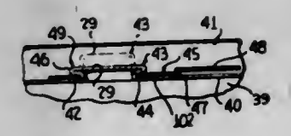


loop taker, means connected to the capillary tube to retain the capillary tube against rotation, means for supplying oil to the capillary tube from the reservoir in the sewing machine frame and ultimately to the bearing surface of the rotary member at substantially the same temperature as the oil in the reservoir, and a valve in the lubricating system which is formed by said means for supplying oil to the capillary tube, said capillary tube and said conduit in the rotary member of the loop taker.

3,272,165
MACHINES FOR MANUFACTURING HEAT TRANSFER UNITS

Richard E. Carlson, Jamestown, and John E. Paulin, Elma, N.Y., assignors to Blackstone Corporation, a corporation of New York

Filed Dec. 16, 1963, Ser. No. 331,002
12 Claims. (Cl. 113—1)



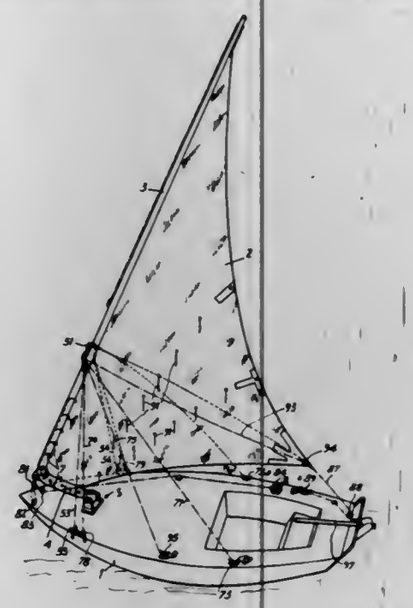
1. In a machine for making water-line separator members, a formed separator feed, a waterline strip feed, a rotating forming wheel having a plurality of spaced work stations, means delivering a measured portion of waterline strip to the forming wheel in its first work station, means at a second work station bending the measured portion of waterline strip adjacent its midpoint back upon itself to form side-by-side portions, a pre-crimp folding means adjacent a third work station folding the free ends of the bent waterline strip together, a final crimping means adjacent a fourth work station forcing the folded free ends into tightly crimped engagement, a rotating stuffer wheel rotatable on an axis parallel to and spaced from the axis of the forming wheel, said stuffer wheel having a receiving position receiving a formed separator member from the separator feed, a stuffer position in which the separator is held adjacent to the rotating forming wheel, stuffing means adjacent a fifth work station in which the stuffer wheel holds the separator member in the stuffer position adjacent the formed waterline, said stuffer means transferring the waterline element around the separator member to form a complete waterline unit, and a discharge position for said stuffer wheel in which the completed waterline unit is discharged from the machine.

3,272,166
METHOD OF ASSEMBLING A PULL ELEMENT AND A CAN END

John Henchert, Oak Park, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York

Continuation of application Ser. No. 88,473, Feb. 10, 1961, now Patent No. 3,151,766, dated Oct. 6, 1964. This application May 7, 1964, Ser. No. 365,689
1 Claim. (Cl. 113—121)

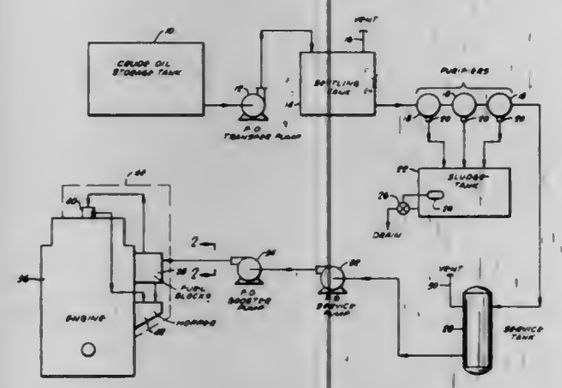
A method of joining a metallic sheet-like pull element to a metallic sheet-like can end panel joined by a seam to a container body comprising the steps of forming a score line in the end panel to define a tear starting end portion of a tear strip with the depth of the score line at the tear starting end portion being greater than the depth of the score line adjacent the starting end portion, forming an aperture in an end portion of the pull element, deforming a central portion of the end portion of the tear strip adjacent the deeper score line thereof to form a hollow offset member integral therewith having a transverse wall, a peripheral wall, a length greater than the thickness of the pull element and a diameter generally equal to the diameter of the aperture, relatively telescoping the offset member of the tear strip and the aperture with the end portions in contact and the end portion of the pull element overlying and projecting radially beyond the deeper scored portion of the score line adjacent the aperture with the pull element wholly confined within the area defined by said seam, forcibly moving the transverse wall toward the first element to outwardly displace sufficient material of the offset member to form an outwardly directed circumscribing bead having a wall thickness substantially greater than the thickness of the transverse wall and overlying engaging the defining edge portion of the aperture of said first element to effect the jointure between the latter and the second element.



3,272,167
SAILING-BOAT

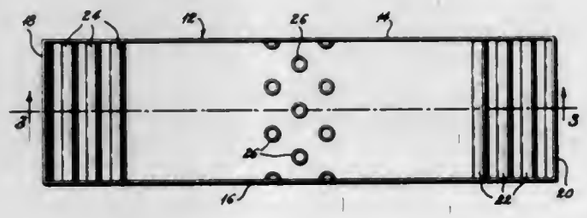
Daniel de Monfreid, 55 Rue Cardinet, Paris, France

Filed Mar. 17, 1965, Ser. No. 440,415
Claims priority, application France, Mar. 27, 1964, 969,031
8 Claims. (Cl. 114—39)



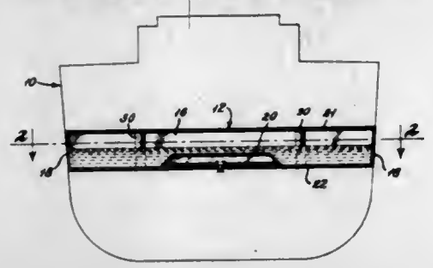
1. A sailing-boat having a hull with a deck; a slanting sail-yard the lower end of which is formed with a rearwardly elbowed extension which is pivoted at its extremity to the middle of the fore portion of said deck by means of a universal joint; means adapted to maintain an intermediate point of said sail-yard in the fore-and-aft vertical mid-plane of said hull; means for limiting the shifting of said intermediate point of said sail-yard forwardly substantially to the vertical extending through said universal

joint; means of adjustable length connecting the lower end of said sail-yard to the fore portion of both sides of said hull, respectively; a four-sided sail having one side secured to said sail-yard, another side secured to said



elbowed extension, while the other two sides thereof are free and form an aft gore of said sail; and a clew line of adjustable length connecting said aft gore of said sail to the rear portion of said hull.

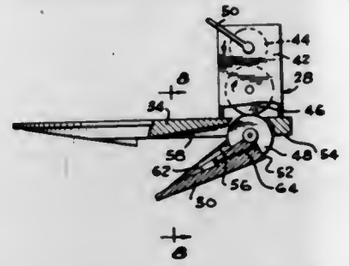
3,272,168
MARINE DRIVE SYSTEM
William J. Donohue, Brooklyn, N.Y., and Harold E. Vander Linde, New Canaan, Conn., assignors to Continental Oil Company, Ponca City, Okla., a corporation of Delaware
Filed June 19, 1964, Ser. No. 376,516
5 Claims. (Cl. 114—74)



1. In combination with a crude oil tanker having a plurality of compartments therein sealed from one another and having a storage tank therein containing crude petroleum oil;
a compression-ignition internal combustion engine having fuel pumping means and fuel overflow means thereon and being located in one of said compartments;
a hood for collecting gases evolving adjacent the engine and preventing the escape of said gases into the compartment containing the engine;
a transfer pumping means connected to the storage tank and the fuel pumping means on the engine for transferring said crude to the engine, said transfer pumping means being located in a second of said compartments;
a centrifuge interposed in the connection of the transfer pumping means to the engine fuel pumping means for removing foreign matter from said crude, said centrifuge being located in a second of said compartments;
a sludge tank communicating with said centrifuge; and
means for maintaining said second of said compartments above atmospheric pressure.

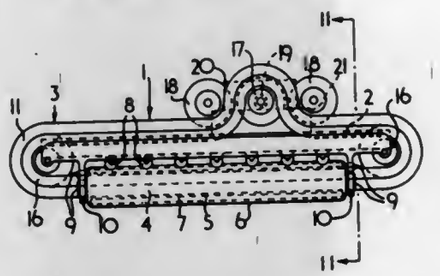
3,272,169
PASSIVE SHIP STABILIZER USING TERMINAL DAMPING MEANS
Lawrence W. Ward, Glen Cove, N.Y., assignor to John J. McMullen Associates, Incorporated, New York, N.Y., a corporation of New York
Filed July 30, 1964, Ser. No. 386,198
11 Claims. (Cl. 114—125)

1. A ship stabilizer comprising an elongated tank mounted in a ship with its long axis transverse to the roll axis of the ship, a liquid body partially filling said tank, a plurality of elongated members mounted in said tank at each of the longitudinal end regions thereof, each of said plurality of members being arranged in a substantially horizontal plane, a portion of the outer surface of each of said members being continuous around the axis thereof and being spaced from the sides and ends of said tank and from the others of said plurality of members, whereby a portion of said liquid body transfers in said tank and passes upwardly through the spaces between said members in response to the roll of said ship.



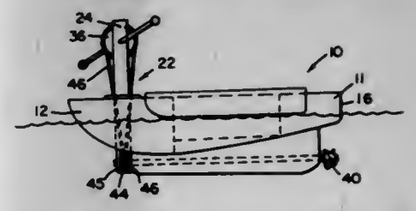
3,272,170
SHIP STABILIZER USING ELONGATED WEIR MEANS
Edward D. Dreyfus, Hyattsville, Md., assignor to John J. McMullen Associates, Inc., New York, N.Y., a corporation of New York
Filed Oct. 27, 1964, Ser. No. 406,748
9 Claims. (Cl. 114—125)

1. A stabilization system for ships and the like comprising an elongated enclosed tank mounted in the ship with its longitudinal axis extending transverse to the longitudinal axis of the ship, said tank having a pair of wing portions at opposite ends thereof, and an interconnecting portion extending from one wing portion to the other, an elongated weir mounted on the bottom of said interconnecting portion and having a top spaced below the top of said tank, said weir top being mounted generally in a horizontal position and extending throughout a major part of the length of said interconnecting portion, said weir also extending from one side of said tank to the other and having a downwardly sloping end plate



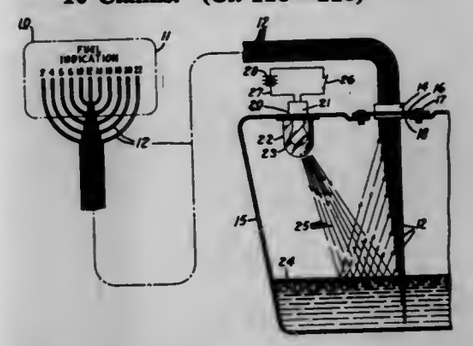
extending from each end of said weir top to the tank bottom, a body of liquid partially filling said tank to a predetermined static level, the top of said tank at said interconnecting portion being above said static liquid level to define an air space above said liquid body and below said tank top.

3,272,171
LANDING CONTROL AND EMERGENCY STEERING DEVICE FOR WATER CRAFT
Miroslav Korcak, 4010 Fairway Drive, Studio City, Calif.
Filed Mar. 31, 1965, Ser. No. 444,175
10 Claims. (Cl. 114—145)



1. A steering control for a water craft comprising:
a wedge-shaped base, having mutually inclined upper and lower surfaces, adapted to be attached to the underside of the hull of said craft with its narrower end forwardmost on said hull and with said upper surface adjacent said hull and in water-tight relationship therewith;
a vane;
hinge means mounted transverse to said base near the rearwardmost end thereof and attached transversely along the rearwardmost end of said vane thereby permitting said vane to rotate between a fully retracted position adjacent the lower surface of said base and a fully extended position substantially perpendicular to said lower surface;
a water-tight housing integrally formed on the upper surface of said base and projecting upwardly through the hull of said craft;
driving means within said housing operatively connected to said vane for rotating said vane between said retracted position and said extended position; and
control means within the craft for selectively controlling said driving means.

3,272,172
LOAD OR VEHICLE SUPPORTING DEVICES
Richard Noel Thomson, Coleshill, England, assignor to Dunlop Rubber Company Limited, London, England, a British company
Filed Aug. 31, 1964, Ser. No. 393,235
Claims priority, application Great Britain, Sept. 6, 1963, 35,234/63
16 Claims. (Cl. 115—1)



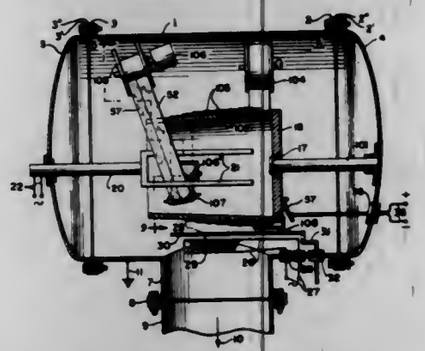
1. A load supporting device comprising an annular inflatable support having a longitudinal axis, two annular walls which lie radially one within the other with respect to said axis and define between them an annular inflatable chamber, and a reinforcement of substantially inextensible material, the walls being relatively axially movable to cause axial rolling movement of the support by eversion of said walls, the device also comprising a driving member which has a longitudinal axis and is provided with projections, the driving member extending axially through the support the radially inner wall of which lies against and is wrapped around the projections in the inflated state of the support to effect movement of the radially inner wall of the support relative to the radially outer wall by axial movement of the driving member, to cause axial rolling movement of the support.

3,272,173
TOY BOAT
Sebastian Avellino, Roslindale, Mass. (8 Anderson Road, Stroughton, Mass.)
Filed Apr. 2, 1965, Ser. No. 444,977
4 Claims. (Cl. 115—22.3)

1. A single passenger, lightweight boat comprising a hydrodynamically shaped body having a longitudinally extending axis, said body being made of low density plastic foam material and being capable of supporting the weight of a passenger balanced about said longitudinal axis,
a seat suspended on a lower part of the body on which said passenger may sit with his legs and part of his torso submerged,
a screw propeller suspended by the body,
hand operated drive means mounted on the body in front of the seat and connected to the screw propeller for rotating the screw propeller to propel the boat,
steering means for turning said boat, said means consisting essentially of at least one non-movable projection fixed with respect to said body and extending outwardly on either side of said axis of said body whereby shifting of the passenger's weight from one side of said body to the other causes turning of the boat in the water leaving the hands of the passenger free to operate said drive means.

3,272,174
REMOTE LEVEL INDICATION
John F. Pribonic, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 7, 1965, Ser. No. 485,282
10 Claims. (Cl. 116—118)

1. In combination for use with a storage container located remote from panelling having predetermined graduated scale marking as to level content, a fiber optic level system including an energizable illuminating source



directly in the container, and a single fiber optic bundle of light transmitting elements collectively of differing lengths in a graduated scale of even integers of steps of each light transmitting element per se within the storage container and having ends thereof remote from the container terminating at the panelling, each said element per se having the end thereof subject to content immersion whereby light transmittal individually is darkened from said illuminating source directly in the container.

3,272,175

VAPOR DEPOSITION MEANS FOR STRIP-COATING CONTINUOUSLY MOVING, HELICALLY WOUND RIBBON

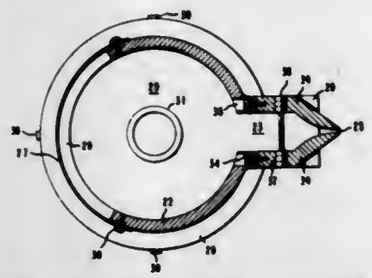
Albert Lorenz, Hanau am Main, Paul Müller, Hanau-Kesselstadt, Walter Reichelt and Bernhard Rosenstock, Hanau am Main, and Richard Seiz, Bruchkobel, Germany, assignors to W. C. Heraeus Gesellschaft mit beschrankter Haftung, Hanau am Main, Germany, a corporation of Germany

Filed May 12, 1965, Ser. No. 457,249
4 Claims. (Cl. 118—49)

1. An apparatus for partially coating a flat elongated metallic ribbon comprising, in combination:

(a) a sealable chamber;
(b) means for evacuating said chamber;
(c) evaporator means in said chamber;
(d) a drum in said chamber spaced from said evaporator means, said drum having an axis and a conically tapering face about said axis;
(e) two reel means rotatably mounted in said chamber;
(f) a motor means for rotating one of said reel means; and
(g) securing means for securing an elongated ribbon on said face in a plurality of axially consecutive turns in such a manner that each portion of said ribbon is parallel to said axis, and an edge portion of one turn overlaps an edge portion of an axially adjacent turn while the other edge portion of said one turn is overlapped by an edge portion of another axially adjacent turn, said securing means including a guide pulley for guiding a ribbon from the other one of said reel means over said face in said turns while respective portions of said ribbon are wound on said one reel means and said ribbon is moved longitudinally under the force of said motor means.

3,272,176



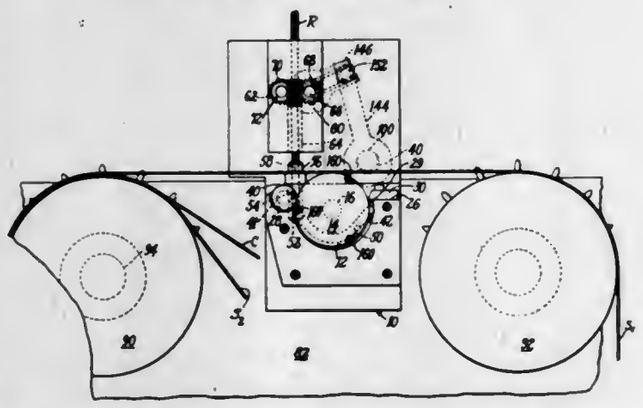
AIR KNIFE

Bernard Karl Saydlowski, Rochester, N.Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Filed Apr. 13, 1964, Ser. No. 359,158
8 Claims. (Cl. 118—63)

1. An air knife which comprises

(a) an elongated body having closed ends and forming a plenum chamber;
(b) a lengthwise slot in the wall of said chamber forming a fluid exit slot, the outer surface of the body adjacent said slot having planar surfaces extending laterally from said slot;
(c) a pair of lip members disposed adjacent said slot the ends of the lip members having planar surfaces that interfit with the respective planar surfaces of the body when the lip members are attached thereto, at least one lip member being fastened to the body for slideable adjustment, thereof the outer portions of the lip members forming an orifice near their outer extremities;
(d) bored slots in the inner wall of said chamber adjacent the planar surfaces and coative openings in the walls of the chamber communicating with the slots and engageable openings in the planar ends of the lip members;



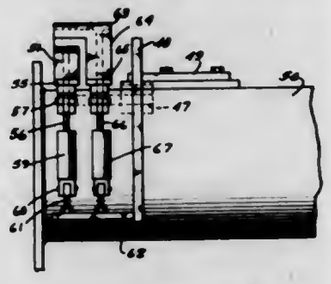
(e) fastening means of smaller dimensions than and extending through said slots and coactive openings and engaging the openings in the lip members, the fastening means for at least one lip member being adjustable whereby the lip member can be adjusted laterally and aligned adjacent the fluid exit;
(f) a row of adjusting bolts extending between said lip members and perpendicular to the axis of said orifice, the bolts being threaded on each end and provided with means for engaging a tool for turning the bolts;
(g) a fluid supply inlet communicating with said chamber;
(h) large spaced openings in the wall of said chamber opposite said slot; and
(i) a plate covering said openings.

3,272,177

ADHESIVE APPLYING APPARATUS

John S. Kelley, Wenham, Mass., assignor to United Shoe Machinery Corporation, Flemington, N.J., a corporation of New Jersey

Filed Nov. 12, 1963, Ser. No. 322,829
4 Claims. (Cl. 118—202)



1. Apparatus for applying adhesive to work pieces comprising an intaglio applicator wheel having a cylindrical operating surface and provided with circumferentially disposed recesses, a heated casing formed to provide a chamber having a circular shaped wall and oppositely facing side walls, means mounting the applicator wheel for rotation in the casing between said side walls and with its peripheral surface adjacent to said circular shaped wall of the chamber, a metering bar having an operating edge mounted on the casing between said circular shaped wall and said cylindrical operating surface with said operating edge substantially in contact with the peripheral surface of the applicator wheel at the leaving end of said chamber, means for driving the wheel in a direction such that its operating surface moves along the circular shaped wall of the chamber toward said metering bar, and means for supplying molten adhesive to said chamber in a location closely adjacent to said metering bar under pressure and at a minimum rate just slightly in excess of the rate in which molten adhesive would be transferred to a work piece from the applicator wheel with the recesses therein filled substantially level with the peripheral surface of the wheel, and means for increasing the rate at which molten adhesive is supplied to the chamber above said minimum rate to cause molten adhesive to accumulate in the chamber reversely from the metering bar against rotation of the wheel and pressure of the molten adhesive adjacent to the metering bar to increase, whereby the recesses in said wheel are overfilled with adhesive, under the increased pressure, and the rate of transfer of adhesive to a work piece is correspondingly increased.

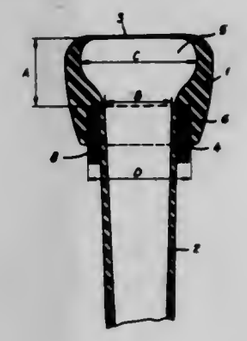
3,272,178

EDGE CONTROLS FOR FLOODED NIP COATERS

Wayne P. Sorenson, Robert H. Shugarts, and James H. Rilhl, Beloit, Wis., assignors to Beloit Corporation, Beloit, Wis., a corporation of Wisconsin

Filed Aug. 15, 1963, Ser. No. 302,309
3 Claims. (Cl. 118—249)

1. In a device for coating a traveling paper web, in combination,



a backing roll wrapped by the traveling web and rotatably driven in one direction,
an applicator roll beneath said backing roll and with said backing roll defining a nip through which the paper web travels,
a pan containing coating material and having said applicator roll partially immersed in the coating material contained therein,
a doctor blade at the outgoing side of the nip between said rolls and engaging the coated paper web traveling about said applicator roll for smoothing the coating material on the web,
and means on the incoming side of the nip between said rolls for controlling the application of coating to the edge portions of the web and preventing said doctor blade from spreading the coating material onto said backing roll comprising:
a pair of first and second end wipes extending inwardly from each of the opposite ends of the applicator roll on the incoming side of the nip between said rolls,
one of each pair of first and second end wipes extending axially inwardly along the applicator roll a greater distance than the other and engaging the peripheral surface of said applicator roll in overlapping and circumferentially spaced relation with respect to the other,
and individual actuators operatively connected with each of said end wipes and selectively operable to move a selected end wipe against the circumferential surface of said applicator roll in accordance with the width of the sheet being coated.

3,272,179

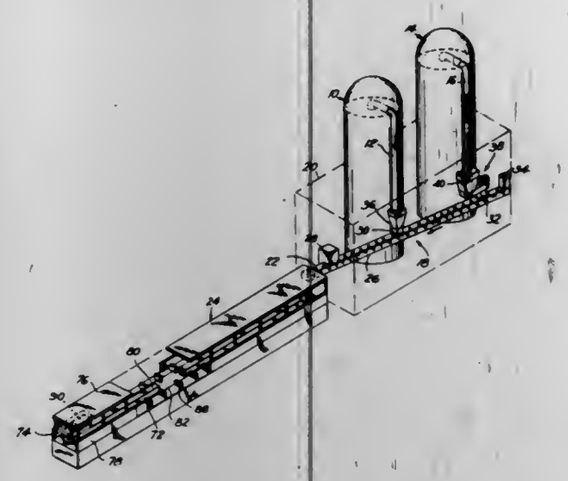
SELF-FITTING TEAT CUP LINER

Bengt Erik Mikael Troberg, Hamra Gard, Tumba, Sweden, assignor to Alfa-Laval AB, Stockholm, Sweden, a corporation of Sweden

Filed Sept. 15, 1964, Ser. No. 396,567
Claims priority, application Sweden, Sept. 26, 1963, 10,541/63
2 Claims. (Cl. 119—14.49)

1. A teat cup liner comprising a top and a tubular body affixed to the top, the top having at its upper end an opening for insertion of a teat and having at its lower part an annular groove for receiving the upper end of a teat cup shell, said top having a substantially cylindrical vertical side wall surrounding a large hollow space located above the level of said groove and having an axial dimension which is at least equal to the largest inner diameter of the tubular body, said tubular body being adapted to be stretched between the ends of said shell, said upper end of the top forming an essentially flat wall defining said opening and which is resilient and substantially thinner than said side wall and the wall of the tubular body, the diameter of said hollow space being so large that the upper edge of the side wall lies against the udder at such a distance from the teat that it does not exert any pressure on the wall of the udder in the region nearest the teat root, the vertical side wall surrounding said hollow space being substantially thicker than the wall of said tubular body so as to prevent any appreciable compression of the hollow space either axially or radially, to a smaller volume under normal operating conditions.

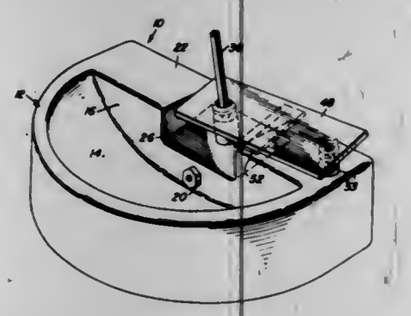
3,272,180



ANIMAL FEED PROPORTIONING AND MIXING APPARATUS

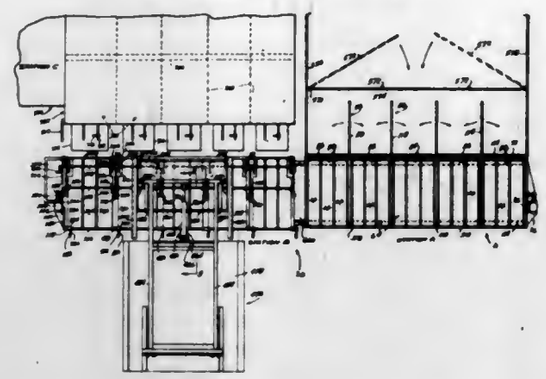
Jule P. Schommer, West De Pere, Wis., assignor to H. D. Hudson Manufacturing Company, Chicago, Ill., a corporation of Minnesota

Filed Apr. 29, 1964, Ser. No. 363,475
6 Claims. (Cl. 119—52)



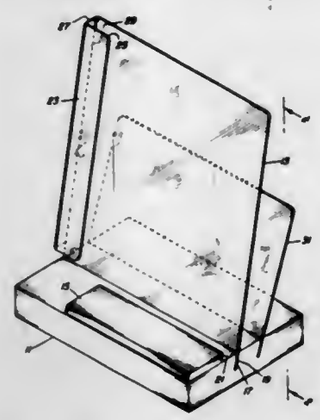
1. Animal feeding apparatus comprising in combination, a first source of a first substance to be fed, a second source of a second substance to be fed, said sources constituting silos and the lower part of said silos being disposed in an enclosure; a proportioning unit also in said enclosure coupled with said sources for regulating the mixture of said substances according to a pre-set proportion and transferring the mixture to a point of discharge, and including a primary conveyor having a first inlet for receiving a first substance and having a second inlet,

drive means for driving the primary conveyor at a preset rate of travel, an auxiliary conveyor disposed to receive a second substance and transfer it to the second inlet of the primary conveyor, a second drive means for driving the auxiliary conveyor at a preset rate of travel, said



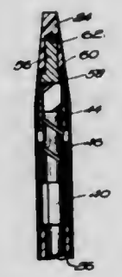
auxiliary conveyor including an auger, and control means for regulating the rate of travel of the auger relative to the primary conveyor in accordance with the amount of the second substance to be fed; a feeding bunk for receiving the discharged mixture of said substances, and means for distributing the discharge mixture in the bunk.

3,272,181
ANIMAL ACTUATED DRINKING FOUNTAIN
Paul E. Ramsey, Midland, Tex., assignor of five percent to H. M. Walters, Midland, Tex.
Filed Apr. 22, 1965, Ser. No. 450,005
6 Claims. (Cl. 119—76)



6. An animal actuated watering device comprising a trough having a bowl portion therein, a tubular valve seat on said trough outward of said bowl portion, a housing on said trough defining a fluid chamber about said valve seat, an aperture in said housing, an elongate hollow water passageway-type valve stem extending through said aperture and in water receiving and sealing engagement with said housing, said stem having a sealing means on the bottom thereof adapted to sealingly seat on said valve seat, said elongate stem extending substantially beyond said housing, an abutment means secured to said stem beyond said housing, an elongated operating plate having a first end thereof over said abutment means, said plate extending outward from said stem, means pivotally mounting said plate, and means engaged with the plate and biasing the first end thereof against the abutment means which in turn effects a seating of the stem, whereby said plate may be actuated to allow fluid pressure to lift said stem from its seat.

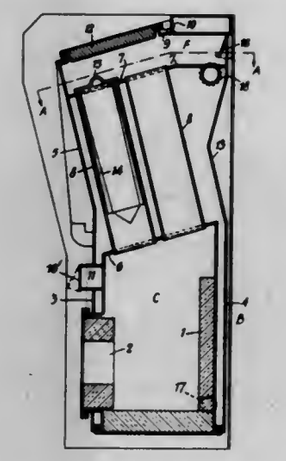
3,272,182
TURKEY-LOADING APPARATUS
Clifford C. Lund, Box 384, Moroni, Utah
Filed Oct. 22, 1965, Ser. No. 501,729
10 Claims. (Cl. 119—82)



1. A poultry-loading system comprising a loading station, a transfer station, and a transport station including mobile means, said loading and transfer stations both including normally horizontal track means disposed in abutting relation at a pair of adjacent ends thereof, a carriage mounted for reciprocation on said track means, means on said loading and transfer stations to effect reciprocation of said carriage, a plurality of poultry crates mounted on said carriage and normally positioned at said loading station to receive poultry to be transported, said reciprocable means being operable to move said carriage and the loaded poultry crates from said loading station to said transfer station, means supported on said track means operable to lock said crates on said carriage in said transfer station, means operable to elevate said transfer station track means, said carriage and said loaded crates into juxtaposition relative to said transport station, and means on said transfer station track means cooperating with means on each of said loaded crates to move said loaded crates from said transfer station to said mobile means at said transport station.

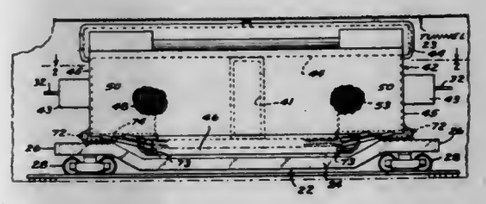
3,272,183
SHEET HOLDER FOR STENOGRAPHER'S PAPERS
Merle E. Craighead and Tannie C. Craighead, both of 921 Missouri St., San Diego, Calif. 92109
Filed July 6, 1965, Ser. No. 469,663
1 Claim. (Cl. 120—28)

A device for maintaining flexible sheets of paper in an upright position, said device comprising in combination:
(A) A base having a flat top, said base having:
(1) a pair of parallelly disposed grooves, one groove being disposed forwardly of the other, each of said grooves extending from the top downwardly and forwardly throughout substantially the entire width of the base to form forward and rearward walls extending throughout substantially the entire width of the base;
(B) an upright and rearwardly extending back, said back extending into the forward groove and the walls of the forward groove forming the sole means for supporting the back, whereby the space immediately rearwardly of the back is unobstructed, said paper when resting against the back also resting on the base immediately forwardly of the back;
(C) means for preventing slippage forwardly of the paper when resting against the back, including:
(1) means on the flat top of the base and spaced forwardly of that portion of the top immediately above the base and adapted to engage the lower edge of the paper;
(2) and means formed integrally with the back and extending inwardly and forwardly along one upright side edge of the back;
(D) and a second back extending into the rear groove, the walls of the rear groove forming the sole means for supporting the second mentioned back.



3,272,184
WRITING INSTRUMENT OF THE RETRACTABLE TYPE
William G. Crowley, Riverside, R.I., assignor, by mesne assignments, to Barrows Industries, Inc., Providence, R.I., a corporation of Rhode Island
Filed Dec. 2, 1963, Ser. No. 327,396
8 Claims. (Cl. 120—42.03)

8. In a writing instrument having a retractable writing end, an elongated tubular member, a tubular barrel enveloping said tubular member, an adaptor, the forward portion of which slidably and non-rotatably engages the rear portion of said tubular member, the rear portion of said adaptor having a helical thread formed thereon, a writing cartridge extending through said tubular member and being connected to said adaptor, wherein said cartridge is longitudinally movable with said adaptor and with respect to said tubular member, a point joined to the forward end of said tubular member, a fitting threadably engaging the threaded portion of said adaptor, and an operating cap secured to said fitting and being rotatable to produce a corresponding rotary movement of said fitting, said adaptor and said cartridge connected thereto being movable in a longitudinal direction in response to the rotary movement of said fitting, wherein the writing end of said cartridge is expelled from or retracted into said point as required.



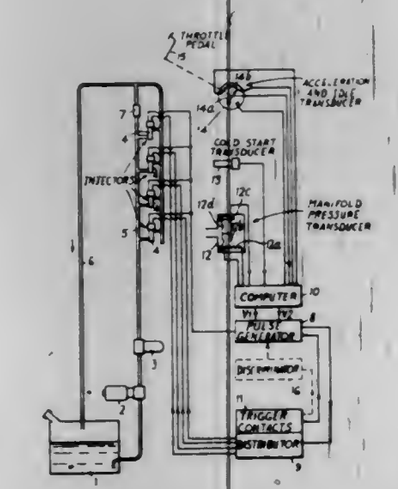
3,272,185
OIL FIRED BOILERS
Laurence Richard Luchford and Thomas Arthur Babbage, East Molesey, England, assignors to Trianco Limited, East Molesey, Surrey, England
Filed Sept. 14, 1964, Ser. No. 396,014
Claims priority, application Great Britain, Sept. 18, 1963, 36,754/63
8 Claims. (Cl. 122—115)

1. A boiler comprising a bottom wall, upwardly disposed front, rear and side walls having their lower portions inwardly spaced plates defining a water jacket surrounding a combustion space, said front wall and cooperating plate having an aperture therethrough for mounting a burner to extend forwardly beyond the front wall, said front wall having an upper portion above said combustion space which is inclined upwardly and forwardly to project beyond the lower portion, said rear wall having an upper portion which inclines forwardly and upwardly for part of its height and inclines rearwardly and upwardly for the remainder of its height, a water space

above said combustion space defined at the bottom by a lower header plate, at the top by an upper header plate, and by said inclined upper portion of the front wall and the upper portions of said rear and side walls, said water space communicating with the interior of said water jacket surrounding the combustion space, a flue space between said upper header plate and a top wall spaced thereabove, and a plurality of flue tubes inclined forwardly and upwardly across said water space to communicate said combustion space with said flue space.

3,272,186
PACKAGED STEAM GENERATOR
Robert A. Lorenzini, Westport, Conn., assignor to Foster Wheeler Corporation, New York, N.Y., a corporation of New York
Filed Nov. 25, 1964, Ser. No. 413,910
4 Claims. (Cl. 122—336)

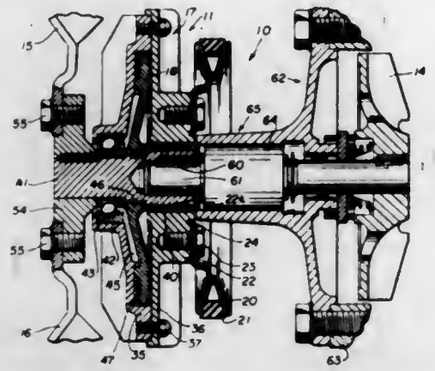
3. A steam generator comprising:
a major enclosure of steam generating tubes including a floor,
a minor enclosure of steam generating tubes, said minor enclosure extending from said major enclosure and being in a higher plane than said floor of said major enclosure,
a steam drum extending across the top of both said major enclosure and said minor enclosure, said steam generating tubes of both of said enclosures being directly connected to said steam drum,
a water drum extending across the bottom of only said major enclosure, only said steam generating tubes of said major enclosure being directly connected to said water drum,



a lower side header lying directly beneath said minor enclosure and in a plane above said water drum, the steam generating tubes of said minor enclosure being directly connected to said lower side header,

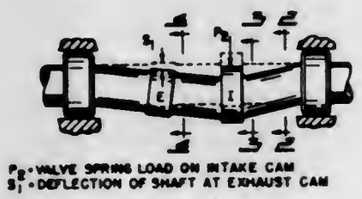
a lower burner-wall header being directly connected to and extending horizontally and perpendicularly from said water drum, the remaining portion of the steam generating tubes of said minor enclosure being directly connected to said lower burner-wall header,

means for connecting said lower side header to said lower burner-wall header, and,



means for connecting said lower side header to said water drum.

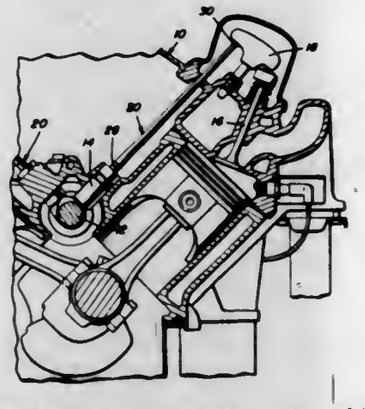
3,272,187
FUEL INJECTION SYSTEMS FOR INTERNAL COMBUSTION ENGINES
Michael Hereward Westbrook and Richard Tett Skipworth, both of Leamington Spa, England, assignors to Associated Engineering Limited, Leamington Spa, England, a British company
Filed Sept. 8, 1964, Ser. No. 394,824
Claims priority, application Great Britain, Sept. 9, 1963, 35,495/63
7 Claims. (Cl. 123—32)



1. A fuel injection system for internal combustion engines comprising at least one electromagnetically operated fuel injection valve, a control circuit producing electrical pulses for energizing said at least one injection valve, so that said valve is opened for a period depending on the duration of each of the pulses to pass fuel to the engine, said control circuit comprising a monostable multivibrator having a timing circuit consisting only of components having values which are invariable during the operation of the system and including a timing capacitor which is charged through a constant current device, means for feeding said timing circuit with first and second variable voltages which vary as a function of parameters of engine operation to control the duration of the output pulses fed to energize said at least one injection valve and wherein said variable voltages fed to the timing circuit are derived from a computer device, independent of the control circuit and comprising a plurality of variable resistance devices connected across a voltage supply, and means for respectively varying said resistance devices in response to different parameters of engine operation, and wherein the duration of the output pulses varies linearly with respect to the first control voltage produced in dependence upon manifold pressure and is proportional to the second control voltage produced in response to other parameters of engine operation.

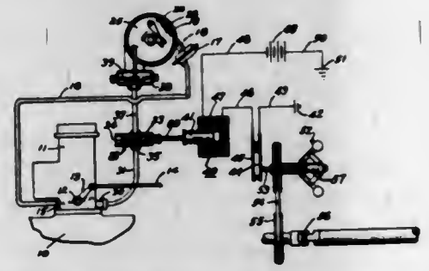
3,272,188
COMBINATION FAN AND WATER PUMP DRIVE
Arthur G. Sabet, Warren, Mich., assignor to Eaton Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Filed Mar. 2, 1964, Ser. No. 348,542
5 Claims. (Cl. 123—41.11)

3. A drive for an internal combustion engine radiator cooling fan device having fan blades for effecting air flow through the radiator and a pump having an impeller for effecting fluid flow through the radiator comprising fluid coupling means having an input coupling member to be driven from the engine and an output coupling member, said input and output coupling members having opposed spaced surfaces defining a fluid shear space therebetween cooperable with a fluid shear medium for transmitting torque therebetween to continuously effect driving of the output coupling member upon rotation of the input coupling member with the speed of rotation of said output coupling member increasing at a given rate as engine speed increases through a low speed range and at a lesser rate as engine speed increases above the low speed range, means for driving said fan blades and pump impeller from said output coupling member including shaft means fixedly connected to said output coupling member for rotation therewith, said shaft means fixedly supporting the fan blades and the pump impeller and driving the pump impeller and fan blades upon rotation of said output coupling member at an angular speed corresponding to the angular speed of said output coupling member so that the fan blades and pump impeller are increased in speed at a given rate through a low engine speed range and at a lesser rate as engine speed increases above the low speed range.



3,272,189
CAMSHAFT FOR INTERNAL COMBUSTION ENGINE VALVE GEAR
Michael C. Turkish, Lyndhurst, Ohio, assignor to Eaton Yale & Towne Inc., a corporation of Ohio
Filed May 3, 1965, Ser. No. 452,669
19 Claims. (Cl. 123—90)

8. In a valve gear for an internal combustion engine, including a camshaft having a plurality of cams between a bearing span, said cams having different lobe positions so that valves controlled by said cams open and close in sequence, and the camshaft is of a nature that valve spring loads sequentially imposed on adjacent cams are effective to produce deflections of the camshaft and cams and thus produce mechanical interaction between tthe valves controlled by said cams,

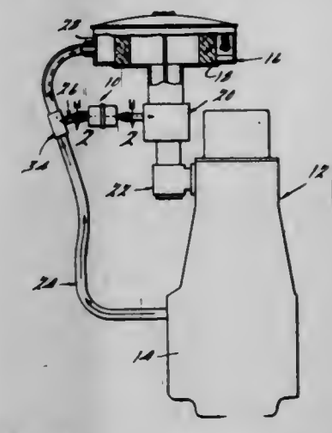


the improvement of a profiled heel on each of the cams, each said heel including a depressed portion to compensate for valve force resulting from camshaft deflection removal during the interval when the undercut profile portion is operable and maintains the valve associated with that cam in a closed position.

3,272,190
TAPERED PUSH ROD
Vincent J. Di Matteo, Sr., Los Angeles, Calif., and Vincent J. Di Matteo, Jr., and Bartolo Di Matteo, both of 7415 8th Ave., Los Angeles, Calif.; said Vincent J. Di Matteo, Sr., assignor to said Vincent J. Di Matteo, Jr., and said Bartolo Di Matteo
Filed July 21, 1965, Ser. No. 473,782
9 Claims. (Cl. 123—90)

1. An enlongated tapered push rod, said push rod including a long tubular main body portion substantially evenly tapered throughout substantially its entire length, the opposite ends of said push rod including short terminal end sections at least substantially closing the opposite ends of said main body portion and adapted to have longitudinal thrusts applied thereto, and wherein the wall thickness of said main body portion substantially evenly tapers in thickness from one end portion to the other end portion thereof.

3,272,191
ENGINE SPARK CONTROL FOR REDUCING SMOG
Brooks Walker, 1280 Columbus Ave., San Francisco, Calif.
Filed Mar. 4, 1965, Ser. No. 445,815
14 Claims. (Cl. 123—117)



13. An internal combustion engine for a motor vehicle having an ignition system including a vacuum controlled spark advance means, a vacuum controlled spark retard means, a drive shaft driven by said engine, means for sensing the speed of rotation of said drive shaft, a valve controlled by said speed sensing means for applying high engine developed suction to said retard device at predetermined low drive shaft speeds to retard said spark advance means, said valve applying high suction to said retard device at various engine speeds while said vehicle is stationary.

ERRATUM

For Class 123—119 see:
Patent No. 3,273,161

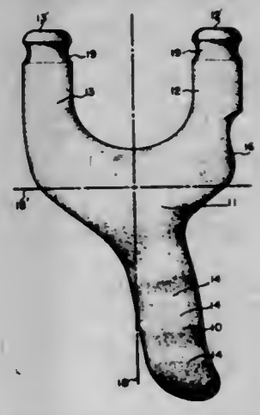
3,272,192
FILTER
Richard V. Jensen and Robert J. Offer, Racine, Wis., assignors to Walker Manufacturing Company, Racine, Wis., a corporation of Delaware
Filed May 4, 1964, Ser. No. 364,575
9 Claims. (Cl. 123—119)

1. In a filter device

a filter housing comprising a pair of cup-shaped shell sections,

said shell sections being joined together in an air-tight joint,

the outer ends of said shell sections being necked down and forming reduced diameter inlet and outlet sections,

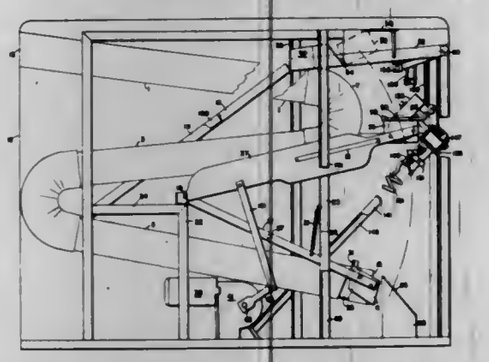


a cylindrical filter element in one of said shell sections,

said filter element being formed with a generally concave end adjacent said outlet section, and

an annular perforate support plate supporting said filter element in said housing in a position confronting said outlet section,

said support plate being dome-shaped and being nested within said concave end of said filter element.



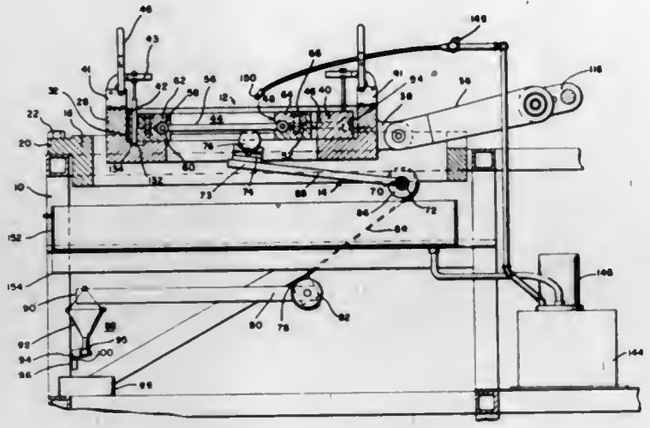
3,272,193
CROTCH TYPE CATAPULT FRAME
Ray Olecko, 654 Kent Road, Winnipeg, Manitoba, Canada
Filed July 23, 1964, Ser. No. 384,673
12 Claims. (Cl. 124—20)

1. A catapult frame comprising in combination a pair of spaced and parallel, elastic carrying arms, said arms merging together at the lower ends thereof to form a

yoke, and a hand holding stem extending downwardly from said yoke and in the same plane as said yoke, the vertical axis of said stem inclining away from the vertical axis of said yoke.

3,272,194
BALL PROJECTING DEVICE
John P. Egbert, Los Angeles, Calif., assignor, by mesne assignments, to Criterion Metal Fabricators, Inc., Inglewood, Calif., a corporation of California
Filed July 13, 1962, Ser. No. 209,554
11 Claims. (Cl. 124—26)

5. In a ball projecting device, the combination comprising: a ball striking arm pivoted at one end about a pivot; a ball striking surface on said striking arm, said ball striking surface moving through an arc between first and second limits as said arm is rotated about said pivot; a ball feed and firing track comprising first and second members spaced apart by a distance less than the diameter of a ball and disposed on opposite sides of said arc for at least a portion of the distance between said limits whereby said striking surface may move between said first and second members; a ball firing station including means for holding a ball on said track at a position which lies on said arc; cyclically operable drive means for rotating said ball striking arm about said pivot to move said ball striking surface to said first limit; said drive means including means releasing said striking arm when said surface reaches said first limit; spring means associated with said striking arm for storing energy as said ball striking surface is moved to said first limit, said spring means acting against said striking arm to release said energy stored by said spring and move said ball striking surface toward said second limit when said striking arm is released; and feed means operatively responsive to said drive means for feeding a ball into said firing station during the interval said ball striking surface is moving between said ball firing station and said first limit; and means for stopping said striking arm when said ball striking surface reaches said second limit.



3,272,195
DEVICE FOR SLICING CRYSTALLINE MATERIAL
Jon H. Myer, Newport Beach, and Michael T. Gromek, Campbell, Calif., assignors to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware
Continuation of application Ser. No. 248,968, Jan. 2, 1963. This application Mar. 23, 1964, Ser. No. 355,994
14 Claims. (Cl. 125—16)

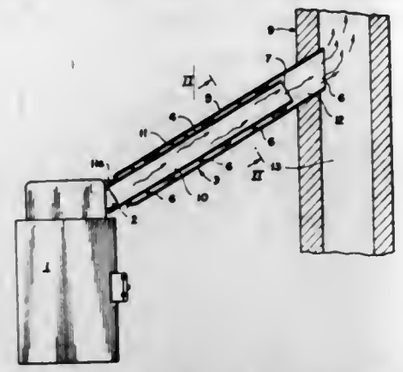
1. A device for cutting into slices a crystal body comprising:

a cutting assembly including at least two relatively thin metal ribbon blades adapted to provide a pair of parallel cutting edges spaced by a distance proportional to the thickness of the slices to be cut from said body;

a work piece holding assembly for positioning said body in engagement with the edge of said blades, said holding assembly including a force biasing means to bias said body into engagement with said blades under a resilient pressure and retracting means responsive to the position of said body to separate one of said bodies from said blades when it has been sliced;

a drive means coupled to said cutting assembly for reciprocating said assembly;

abrasive supply means to apply an abrasive to said blades; and



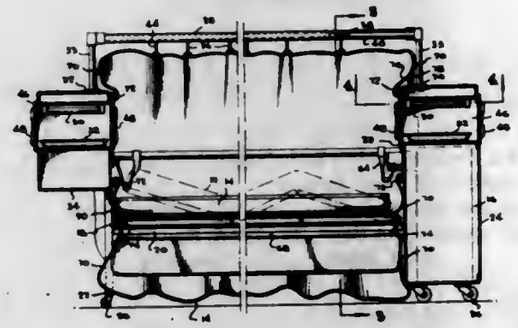
a disabling means responsive to actuation of said retracting means and coacting with said work piece holding assembly to deactivate said drive means when said body has been sliced.

3,272,196
PORTABLE FOLDING STOVE
John J. Kueser, St. Louis, Mo., assignor to Knapp-Monarch Company, St. Louis, Mo., a corporation of Delaware
Filed Oct. 19, 1964, Ser. No. 404,799
5 Claims. (Cl. 126—38)

1. In combination with a folding stove of the type having a stove body and a cabinet, with a bottom, for storing said stove body, a locking mechanism comprising an opening in said stove body, and a latch member pivotally carried by the bottom of said cabinet for engaging said opening only when said stove is stored within said cabinet and only when the cabinet bottom is away from a supporting surface.

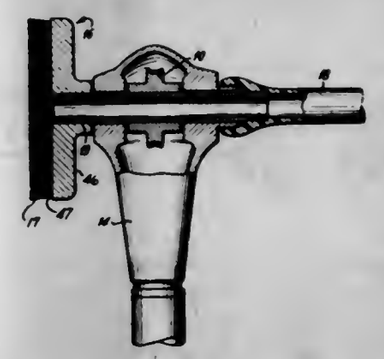
3,272,197
INCINERATOR FLUE
Edward L. Gordon, 2001 Center Ave., Pittsburgh, Pa.
Filed Jan. 4, 1965, Ser. No. 423,258
2 Claims. (Cl. 126—307)

1. In combination with an incinerator and a chimney, a conduit assembly connecting the exhaust of said incinerator to a chimney, said conduit assembly comprising two concentric conduits, one contained within the other in spaced relationship, a plurality of radially extending spacer elements connected between said inner and outer conduits, the outer conduit being spaced from the inner conduit at the end to which the incinerator exhaust is connected so as to draw outside air into the space between



said conduits as the result of chimney effect, the discharge end of only said outer conduit extending through the chimney wall, the discharge end of said inner conduit being spaced from said chimney wall.

3,272,198
METHOD FOR INDUCING STATE OF REDUCED AWARENESS
Burton E. Balkin, Philadelphia, Pa.
(304 Old Lancaster Road, Merion, Pa.)
Filed July 29, 1963, Ser. No. 298,206
7 Claims. (Cl. 128—1)

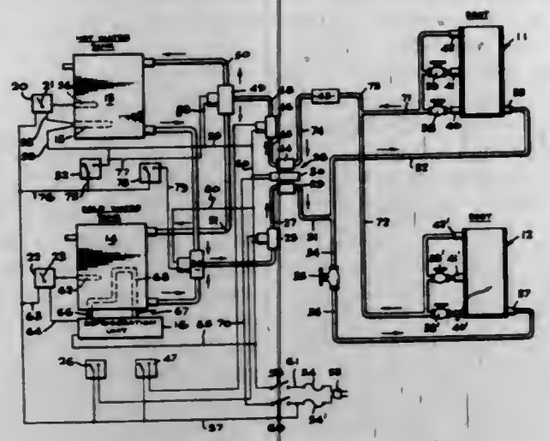


1. A method for inducing in a human subject a state of reduced awareness and loss of pain sensibility which comprises exposing the subject to a continuous pulsative sound within the frequency range of 500 to 3000 cycles per second, such sound having between 1 and 10 pulses per second, a peak power of between 60 to 100 decibels during each of said pulses, with each of said pulses having a rise or fall time of no more than 3 milliseconds, and with the acoustic level between pulses being at least 20 decibels below the peak.

3,272,199
PROCESS AND ASSEMBLY FOR ENCLOSING A VOLUME
Frank E. Matthews, Falls Church, Va., assignor to Matthews Research, Inc., Alexandria, Va., a corporation of Virginia
Filed Jan. 28, 1965, Ser. No. 428,794
7 Claims. (Cl. 128—1)

1. An enclosed working area assembly comprising: a working area surface having a predetermined longitudinal and lateral extent, first supporting means extending beneath said surface while engaging and maintaining said surface in a raised position to provide an unobstructed area beneath said surface, a flexible film enclosure of approximately cylindrical shape, said enclosure hanging freely alongside and extending continuously around and out of contact with said working area surface, said enclosure having a central axis and being at least twice the longitudinal length of said surface, inlet means to inflate said enclosure, second supporting means positioned on said assembly and connected to said enclosure for telescopic movement of said enclosure around said surface along the central axis, said enclosure being provided with end panels intersecting said central axis, means maintaining each end panel having an interior portion at a predetermined constant separation, a rollable underlap means integral with said interior portion and forming a portion of said end panel, said underlap means comprising a flexible sheet connected to said film enclosure and surrounding said interior portion, said underlap means and said film enclosure each having an inner and an outer surface, whereby when the enclosure is inflated a gas filled fold is formed between opposed and facing inner surfaces of said underlap means and said film enclosure to permit said film enclosure to be rolled along said central axis.

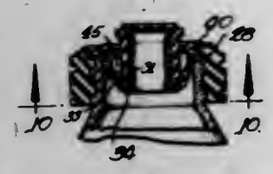
3,272,200
ROTARY BRUSH FOR SKIN AND BODY TREATMENT
Walter Friedmann, Baden-Oos, Germany, assignor to Pharma-Cosma A.G., Zug, Switzerland, a corporation of Switzerland
Filed Aug. 15, 1963, Ser. No. 302,243
Claims priority, application Germany, Oct. 6, 1962, F 37,982
1 Claim. (Cl. 128—56)



Apparatus for skin and body treatment comprising a stationary motor; a handle portion separate from said motor; treatment brush means having a rigid disc shape body with bristles extending therefrom; a hollow tube received in and secured to said body rotatably mounted in said handle portion, said tube extending through said body and having one end terminating flush with the face thereof on the side adjoining the bristles and located centrally of the axes of rotation thereof; means including a flexible shaft interconnecting the hollow tube and said motor to transmit rotation to said tube and thus to said body; a fluid reservoir; and means interconnecting said fluid reservoir and the other end of said hollow tube to deliver fluid thereto.

3,272,201
HYDROTHERAPY DEVICE FOR ANIMALS
Harry J. Burns, Anaheim, Calif., assignor of one-half to Martin Fallon, Jr., Louisville, Ky.
Filed Jan. 31, 1964, Ser. No. 341,574
19 Claims. (Cl. 128—66)

4. In hydrotherapy equipment for the limbs of animals: a pair of boots to accommodate two of an animal's limbs at the same time, each of said boots having a water inlet and at least one water outlet; a hot water tank; a cold water tank; a pump; conduits and valves interposed between said tanks and said inlets for selectively connecting



said tanks to said pump; tubes for conducting the water from said pump to the inlets of said boots; and piping

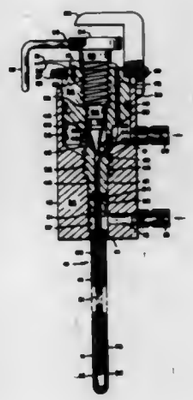
and water directing means interposed between said outlets and said tanks for selectively directing the water from said outlets to either of said tanks.

3,272,202
TWO-POSITION NURSING NIPPLE WITH INTERLOCKING SANITARY COVER
Ricardo Hurtado Soto, Bogota-Suba, Colombia, assignor to Lacto-Seal, Inc., Indianapolis, Ind., a corporation of Delaware
Filed Sept. 5, 1963, Ser. No. 306,762
10 Claims. (Cl. 128—252)

4. In combination, a two-position hollow, integral nursing nipple formed of flexible resilient material and providing an extended nursing position and a retracted storage position, and an integral sanitary cover for protecting said nipple, said cover also being formed of a flexible resilient material and being applicable to and removable from said nipple in said extended position while being releasably secured to said nipple in said retracted position,

said nipple in its extended position further comprising:

(a) an upwardly extending generally cylindrical tip part having an apertured outer end,



(b) a breast part including a generally conical section extending downwardly and outwardly from the lower end of said tip part and a generally cylindrical section extending downwardly from the lower end of said conical section, and

(c) a mount part extending outwardly from the lower end of said breast part cylindrical section;

said nipple in its retracted position having the said cylindrical section and the lower portion of said tip part arranged in confronting relation with an annular space being provided therebetween, and said conical section extending around the bottom portion of said annular space;

said cover including a cylindrical section with a closed outer end and an open lower end, the tip part of said nipple being received in said cover cylindrical section with the lower end of said cylindrical section adjacent said nipple conical section, the lower end portion of said cover section being contactible with said conical section and said conical and cylindrical breast sections rolling around said cover lower end portion as said nipple is moved from extended to retracted position by depressing said cover, said cover lower end portion providing a wall thickness greater than a corresponding dimension of said annular space for gripping said lower end portion and releasably securing it within said annular space.

3,272,203
SURGICAL PROBE
John C. Chato, Arlington, Mass.
(714 W. Vermont Ave., Urbana, Ill. 61801)
Filed Apr. 29, 1963, Ser. No. 276,235
11 Claims. (Cl. 128—303.1)

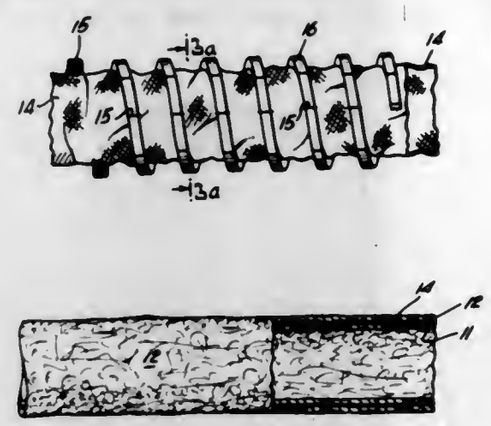
1. A surgical probe comprising a housing having an internal passage along its longitudinal axis and a pair of openings normal to said axis and connecting with said passage, a first tube having one end secured in said passage and its other end capped by a tip, said tip forming an internal annular abutment at its junction with said first tube, a member mounted in said passage of said housing for motion in translation along its said axis, said member also having an internal passage concentric with said passage of said housing and connecting with one of said pair of openings, a second tube with one end secured in said passage of said member and having its free end extending into and in concentrically spaced relation from said first tube, a sleeve secured at its said free end of said second tube, said sleeve and said abutment forming an annular orifice, a temperature sensing means extending into said tip, and a temperature control means mounted in said passage of said member.

3,272,204
ABSORBABLE COLLAGEN PROSTHETIC IMPLANT WITH NON-ABSORBABLE REINFORCING STRANDS
Charles Artandi, Highland Park, N.J., and Lavon Dee Bechtol, Indianapolis, Ind., assignors to Ethicon, Inc., a corporation of New Jersey
Continuation of application Ser. No. 92,620, Mar. 1, 1961. This application Sept. 22, 1965, Ser. No. 495,010
15 Claims. (Cl. 128—334)

1. A method of manufacturing surgical prostheses which comprises the steps of:

impregnating a non-absorbable fabric with an aqueous acid dispersion of swollen collagen fibrils;

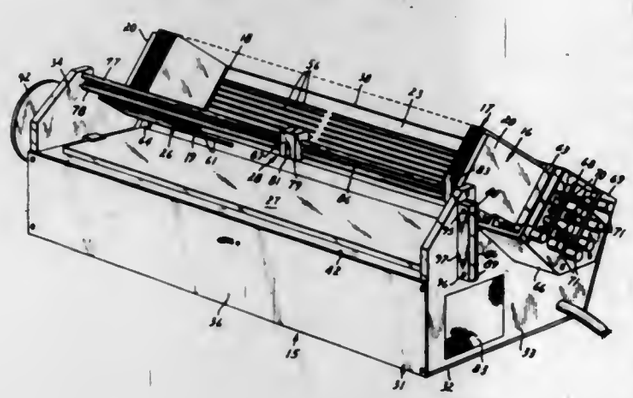
freezing the aqueous acid dispersion of swollen collagen fibrils;



immersing the frozen mass in a water-miscible organic solvent containing sufficient base to neutralize the acid present in said dispersion;

removing the resulting structure from the organic solvent; and,

drying the resulting structure.

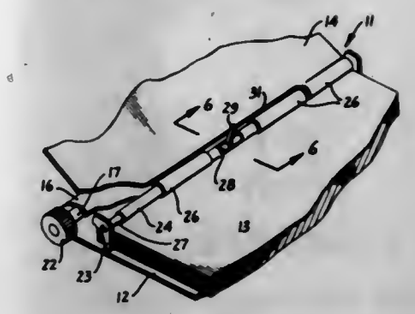


7. A surgical prosthesis comprising:

a woven open mesh non-absorbable cylindrical tube, manufactured of material selected from the group consisting of polyethylene terephthalate and tetra-

fluoroethylene polymer, and coated on both sides with a body absorbable substance consisting of collagen fibrils, whereby the prosthesis is rendered bloodtight.

3,272,205
CARD SELECTOR
Raymond W. Shrewsbury, Roseville, Minn., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware
Filed July 2, 1964, Ser. No. 379,890
10 Claims. (Cl. 129—16.1)



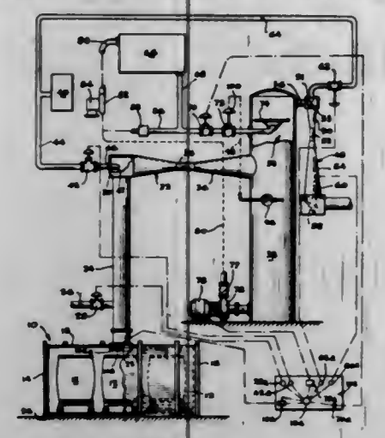
1. An apparatus for retrieving information from information bearing cards by directing light through said cards wherein each card has at least one optical discontinuity area in the body of the card arranged in some predetermined coded order whereby light is deflected by said optical discontinuity area, said apparatus comprising:

means for producing a beam of generally parallel light and directing the same along a predetermined path,

means for supporting at least one of said cards in the path of said light with a predetermined portion of a predetermined edge of a said card substantially normal to and in a said beam of light whereby said beam of light will enter said predetermined edge of said card at a predetermined location to pass therethrough, and

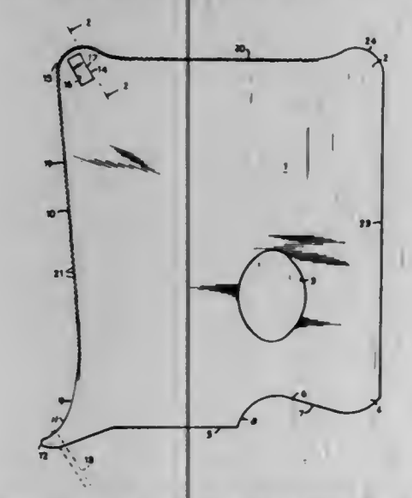
means arranged along a second edge of a said card for determining the location along said second edge at which said deflected light emerges.

3,272,206
CLIPBOARD
Maurine E. Ricke, 153 Smith Road, Alamo Oaks, Danville, Calif.
Continuation of application Ser. No. 222,593, Sept. 10, 1962. This application May 19, 1965, Ser. No. 457,096
5 Claims. (Cl. 129—37)



3. A clipboard including a generally rectangular planar base member, a substantially rigid clamp member having one edge portion thereof positioned adjacent an end of said base member and a downturned second edge portion overlying said base member along a line adjacent and parallel to said end, said clamp member extending to substantially immediately adjacent the opposed edges of said base member, means pivotally connecting said one edge portion of said clamp member to said end of the base member whereby said second edge portion may be selectively moved from and towards said base member, resilient means normally urging said second edge portion toward said base member so as to clamp papers positioned on said base member, a substantially rigid cover member having opposed edges generally conterminous with the edges of said base member and an upper end positioned adjacent said second edge portion of said clamp member, means pivotally connecting said upper end of the cover to said second edge of the clamp whereby the cover may be moved from a first closed position overlying said base member in generally parallel relation thereto to an open position, cam means positioned at each end of clamp member for selectively retaining the latter in open position, and means operatively connecting said cam means with said cover whereby closing of the latter with the clamp in an open position will effect a release of said cam means and a return of said clamp to its closed and clamping position, said cam means extending upwardly from said base member to provide a lateral guide for papers inserted under said clamp when the latter is in open position.

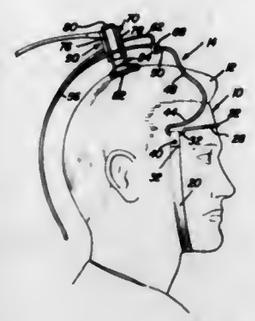
3,272,207
TOBACCO MOISTENING
Frank B. Doyle, P.O. Box 237, Raymond, Ill.
Filed Feb. 6, 1964, Ser. No. 343,090
7 Claims. (Cl. 131—133)



1. An improved apparatus for conditioning tobacco and having a cooling water supply, said apparatus comprising: a hermetically sealable conditioning chamber having means for insertion and removal of said tobacco; a first steam ejector having a low pressure side and a discharge side, the low pressure side of said ejector being in communication with the conditioning chamber; a condenser connected to the discharge side of said first steam ejector, said condenser being connected through flow control means to the cooling water supply; a second steam ejector having a low pressure side and a discharge side, the low pressure side being in communication with said condenser; transducer means responsive to the pressure condition in the condenser and operatively connected to control means to control the flow of cooling water to said condenser and

thereby to control the pressure condition within the condenser to a predetermined level above the dead end level

of the second steam ejector; and means for introducing steam to the conditioning chamber.



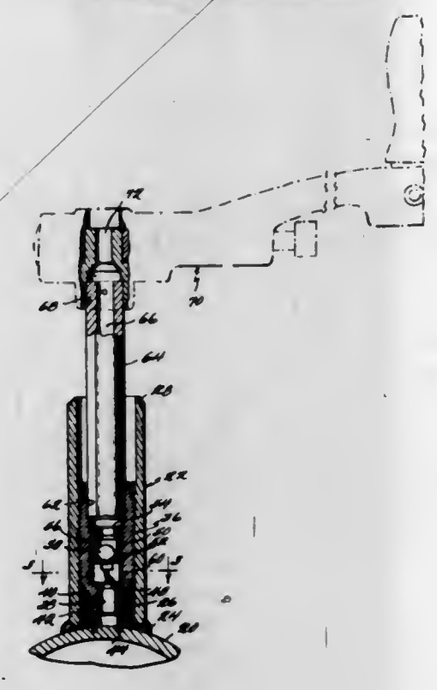
3,272,208
HAIR SPRAY SHIELD WITH COMB AND HAIRPIN REMOVER
Harold E. Hasselbusch, Jr., 144—23 68th Drive, Flushing, N.Y.
Filed Oct. 7, 1963, Ser. No. 314,298
3 Claims. (Cl. 132—9)

1. In a hair spray shield for shielding areas of the person adjacent the hair from liquid spray as the hair is being finally set after it had been initially set with hairpins that are to be removed during the spraying operation, comprising a firm flat surfaced panel of rectangular configuration having means adjacent a side thereof enabling the panel to be manually held in one hand in a particular position when in use and having a corner of hook contour engageable by the operator with a hairpin in the hair of the person so as to lift the hairpin from the hair upon the panel being manipulated in a direction away from the hair; a comb formation extending along a further side of the panel enabling the combing back into place of strands of hair displaced by the operator while employing the hook formation to remove a hairpin.

3,272,209
HAIR CUTTER AND GUIDE ASSEMBLY HAVING COACTING CUTTER POSITIONING MEANS
Robert J. Kraus, 155 Minor St., Dorchester, Mass.
Filed Apr. 1, 1964, Ser. No. 356,582
6 Claims. (Cl. 132—45)

1. A hair cutter and head mounted guide combination comprising support frame means adapted to be stationarily supported from the head of a person whose hair is to be cut by said combination and including a first portion adapted to be positioned above the top of said head when said frame means is supported therefrom, an arcuate guide member pivotally secured at one end portion to said first portion for rotation about an upstanding axis with the other end portion of said guide member curving outwardly and downwardly from said axis and adapted to embrace the adjacent portions of said head in spaced re-

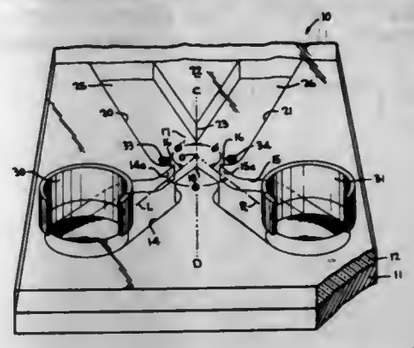
lation thereto, hair cutter supporting carriage means slidably mounted on said guide member for guided movement therealong, a hair cutter, means slidably mounting said hair cutter on said carriage means for movement generally radially of said arcuate guide member, said hair cutter and said guide member including coacting guide means for shifting said hair cutter relative to said carriage means in response to movement of the latter along said guide member.



3,272,210
TELESCOPIC FOLDING CRUTCH
Otto Boruvka, 433 E. 75th St., New York, N.Y.
Filed Sept. 24, 1964, Ser. No. 398,868
9 Claims. (Cl. 135—50)

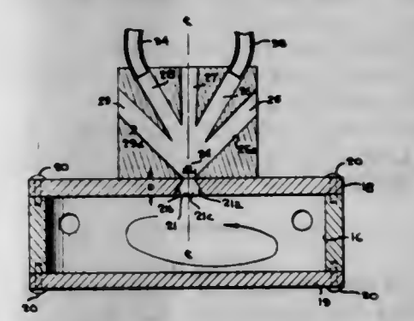
1. In a crutch construction, an elongated staff round in cross section, an arm rest adjustably supported at one end of the staff, and apparatus slidably and removably mounted at the other end of the staff for attaching the staff to a heel of the shoe of the user for transmitting when walking the movement of the shoe to the staff including a horseshoe band adapted to encircle the heel, the free ends of said band having opposed holes therein, and a threaded bolt in said holes spanning the space between the ends, one end of the bolt extending beyond

one of the ends and a wing nut on the extending end of the bolt for adjustably securing the band to the heel.



3,272,211
MAIN AND SERVICE LINE CONNECTION EMBODYING A SELF-TAPPING NIPPLE AND AN EXCESSIVE-FLOW SAFETY VALVE—METHOD AND APPARATUS
Wilbur R. Leopold, Jr., John J. Smith, and Lawrence F. Luckenbill, Decatur, Ill., assignors to Mueller Co., Decatur, Ill., a corporation of Illinois
Filed Sept. 10, 1962, Ser. No. 222,495
9 Claims. (Cl. 137—15)

1. The method of connecting a service line to a main without escape of fluid from the main to the atmosphere, the steps comprising: securing fluid-tight to the wall of the main one end of a nipple; inserting into the other end of the nipple a plug having means on the inner end thereof for perforating the wall of the main by advancement of the plug thereagainst, having a longitudinal through passageway, and having an excessive-flow-safety-valve means controlling the passageway and resettable by reduction of the pressure differential thereacross when closed; advancing the plug into engagement with and perforating the wall of the main to allow fluid under pressure to escape therefrom into the through passageway and close the valve means, while substantially preventing passage of said fluid between the plug and the nipple; retaining the plug within the nipple; connecting a service line fluid-tight to the other end of the T; and reducing the pressure differential across the valve means to open the latter and permit fluid to flow from the main to the line and establish service.

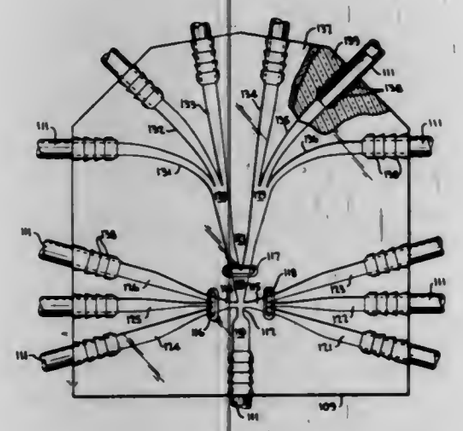


3,272,212
PURE FLUID COMPARATOR
Ronald E. Bowles, Silver Spring, Md., assignor to the United States of America as represented by the Secretary of the Army
Filed May 31, 1963, Ser. No. 284,756
6 Claims. (Cl. 137—81.5)

1. A pure fluid comparator comprising an interaction region, only two outlet passages positioned adjacent one end of said interaction region, a divider positioned between said outlet passages, a pair of nozzles for issuing fluid streams into said interaction region, said nozzles lying at the other end of said interaction region on opposite sides of the centerline of said divider, the center-

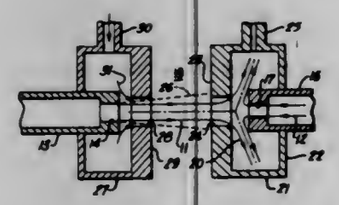
lines of both said nozzles lying at elss than 90° relative to the centerline of said divider.

3,272,213
READOUT FOR VORTEX AMPLIFIER
Donnie Roland Jones, Silver Spring, Md., assignor to Bowles Engineering Corporation, Silver Spring, Md., a corporation of Maryland
Filed Aug. 13, 1963, Ser. No. 301,868
10 Claims. (Cl. 137—81.5)



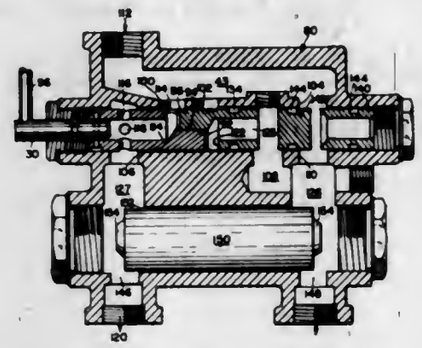
1. In combination, a vortex amplifier having a cylindrical chamber defined by at least one end wall, said end wall having at least one orifice located adjacent to and offset from the center of said wall along a radius thereof, the radial length of said orifice being substantially less than the radius of said end wall, said orifice arranged to issue a stream of fluid into a plane generally perpendicular to said end wall and said radius and deflectable in said plane as a function of the direction and rate of rotation of the fluid in said vortex amplifier, and a pair of passages located in said plane and downstream of said orifice for receiving the stream of fluid issued by said orifice, said passages located on opposite sides of the axis of said orifice and diverging downstream and outwardly therefrom at acute angles relative thereto.

3,272,214
SELF-MATCHING FLUID ELEMENTS
Raymond W. Warren, McLean, Va., assignor to the United States of America as represented by the Secretary of the Army
Filed Oct. 2, 1963, Ser. No. 313,402
4 Claims. (Cl. 137—81.5)



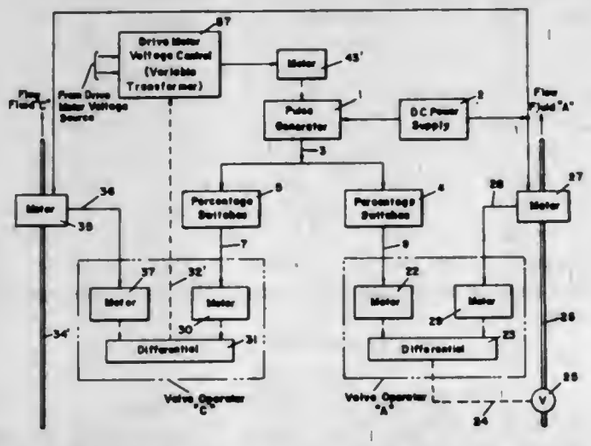
1. In a fluid bistable amplifier:
(a) fluid power source for producing a fluid stream,
(b) a power nozzle connected to said power source,
(c) a plurality of input channels,
(d) an equal plurality of sources of fluid signals connected one to each of said input channels,
(e) some of said plurality of input channels converging to a first control nozzle,
(f) the remainder of said input channels converging to a second control nozzle,
(g) an interaction chamber,

(h) said control nozzles being axially aligned and oppositely directed into said interaction chamber,
(i) said power nozzle being perpendicular to said control nozzles and directed into said interaction chamber,
(j) a pair of receiver means,



(k) each of said receiver means diverging into a plurality of output means,
(l) individual ones of said plurality of output means being dimensioned to receive a predetermined proportion of said power stream,
(m) and bleeder means perpendicular to the fluid flow at the confluence of the input channels and of the receiver means.

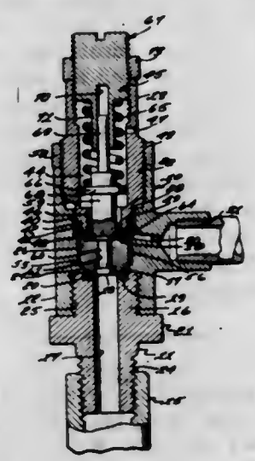
3,272,215
FLUID CONTROL APPARATUS
Bjorn G. Bjornsen, Milwaukee, and Thomas J. Lechner, Jr., Menomonee Falls, Wis., assignors to Johnson Service Company, Milwaukee, Wis., a corporation of Wisconsin
Filed Nov. 1, 1963, Ser. No. 320,680
20 Claims. (Cl. 137—81.5)



1. In a fluid control unit,
(a) means for establishing a pair of impacting fluid jet streams having predetermined operating paths and having opposed stream velocity components and having an impacting position, said means including separate means for establishing each of said jet streams,
(b) control means to modulate the effective strength of at least one of said jet streams to thereby vary the impacting position, and
(c) means including an orifice aligned with said impacting position and located to interact therewith, said orifice defining an output chamber to one side of the orifice having an output connection for deriving a signal and a reference chamber to the opposite side, with the impacting position of the streams with respect to the orifice defining the output signal within the output chamber and being related to the control means.

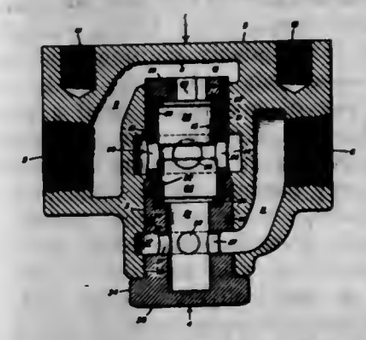
3,272,216
FLOW PROPORTIONING VALVE
Harry E. Lake, Mountain View, Calif., assignor to Todd Shipyards Corporation, New York, N.Y., a corporation of New York
Filed Apr. 22, 1963, Ser. No. 274,449
13 Claims. (Cl. 137—99)

1. A metering valve for fluids comprising a valve chamber having a cylindrical bore therein, an inlet for fluids connected into said bore, outlet means connected into said bore at a spaced location from said inlet and a two-part valve rotor for rotation in said bore comprising a part mounted for rotation in said bore but held against longitudinal movement therein, means for rotating said part, and a mating valve part mounted for rotation in said bore, said two valve parts having mating sections provided with surfaces extending longitudinally to the axis of the valve, the surface on the first valve part causing rotation of the second valve part when the first valve part is rotated, said valve parts having facing transverse surfaces defining between them a discharge orifice for the valve communicating with said outlet means for moving the second valve part toward and away from the first valve part so as to adjust the width of the discharge orifice, the discharge orifice always having the shape approximating a parallelogram of variable width axially of the valve.



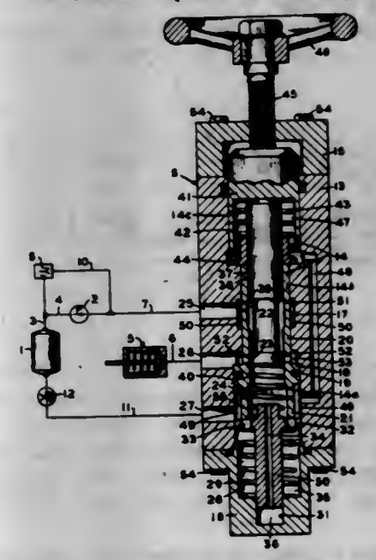
3,272,217
SYSTEMS FOR PROPORTIONING FLUIDS
Einar T. Young, Newton Square, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Filed Mar. 16, 1962, Ser. No. 180,211
17 Claims. (Cl. 137—101.19)

1. An apparatus for proportioning a plurality of materials, comprising a plurality of stations one for each different material; means at each station for sensing the flow of the respective material through the station and providing an output proportional to such flow; a master pulse generator for all of said stations operating to generate a fixed total number of pulses during a time interval whose length is controllable; a controller for each and every one of said stations, each of said controllers being coupled to receive pulses from said pulse generator and each being manually adjustable to pass to its output, during said time interval, only a selected fraction of said total number of pulses; means at each station save a first responsive to the outputs of the respective sensing means and of the respective controller for controlling the flow of material through the corresponding station; and means responsive to the outputs of the sensing means for said first station and of the corresponding controller for controlling the length of said time interval.



15. In combination, means for sensing the rate of flow of a stream of material and for providing an output proportional to such rate of flow, a pulse generator operating to generate a plurality of pulses during a time interval whose length is controllable, a controller coupled to receive pulses from said pulse generator, said controller being manually adjustable to pass to its output, during said time interval, only a selected fraction of said plurality of pulses; means for detecting any departure from a predetermined relationship between the outputs of the sensing means and of the controller for producing an output indicative of the direction of departure from said relationship, and means for utilizing said last-mentioned output to change the length of said time interval in a direction to tend to restore the predetermined relationship.

3,272,218
PRESSURE ACTUATED VALVE
Arthur L. Johnson, El Monte, Calif., assignor to F. C. Kingston Co., Los Angeles, Calif.
Filed Feb. 12, 1963, Ser. No. 257,956
5 Claims. (Cl. 137—102)

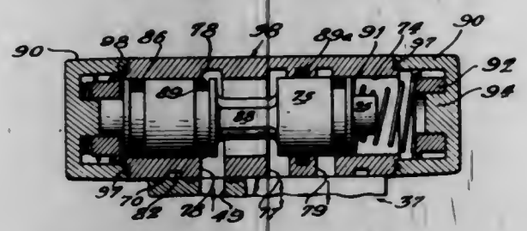


5. A fluid pressure actuated valve which maintains a preselected moderate differential pressure when connected to a wide range of fluid pressures, said valve comprising:
a valve housing having a hollow generally cylindrical interior;
a first port and associated valve seat at one end of said cavity;
a second port and associated valve seat at the other end of said cavity;
a third port in communication with said cavity;
means for selectively varying the distance between said first and second valve seats so that the differential operating pressure of said valve may be varied;
a valve member mounted for axial movement within said cylindrical cavity between a first position in which said valve member sealingly engages said first valve seat and a second position in which said valve member sealingly engages said second valve seat; and,
means for urging said valve member to said first position.

3,272,219
CHECK VALVE HAVING HEAD AND SEAT IN REMOVABLE CARTRIDGE
Virgil L. Frantz, Salem, Va., assignor to Graham-White Sales Corporation, Salem, Va., a corporation of Virginia
Filed Oct. 6, 1965, Ser. No. 493,502
7 Claims. (Cl. 137—112)

1. A check valve comprising a metal body having a bore, inlet and outlet ports in said body and communicating at spaced positions with said bore, and a cartridge unit removably inserted in said bore, said unit including a metal cartridge, a cylindrical chamber in said cartridge, said chamber having openings in opposite ends thereof and intermediate said ends and communicating through at least one end opening with an inlet port and through an intermediate opening with an outlet port, a lightweight non-solid-metal cylindrical shuttle reciprocable in said chamber between ends thereof and freely in at least one direction, and O-rings seated in opposite ends of said chamber about said end openings therein for alternately seating said shuttle, said O-rings spacing said shuttle from said chamber ends and cushioning the reciprocable movement thereof.

3,272,220
HYDRAULIC PRESSURE REGULATING VALVE
Josef Frania and Fritz Scheele, Hannover, Germany, assignors to Westinghouse Bremsen-Gesellschaft m.b.H., Hannover, Germany
Filed Jan. 30, 1963, Ser. No. 255,029
Claims priority, application Germany, Feb. 7, 1962, W 31,634
2 Claims. (Cl. 137—116.5)



1. A pressure regulating valve device for regulating the fluid pressure in a fluid circulatory systems having elements including a non-pressurized source of fluid, pressurizing pump means, an operating device and conduit means interconnecting said elements, said valve device comprising:
(a) a valve body having a bore therein with a supply passage, a delivery passage and a relief passage ex-

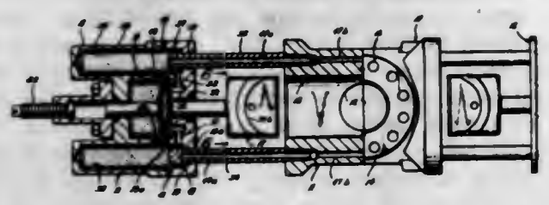
tending from said bore in longitudinally spaced relation therealong for connection, respectively, to the pressurizing pump means for supply of fluid under pressure therefrom, to the operating device for delivery of fluid under pressure thereto, and to the non-pressurized source of fluid for release of fluid under pressure thereto from the operating device,

(b) a hollow control piston having a tubular body and a piston head slidably positioned within said bore of said valve body and having in the tubular body on one side of said piston head a supply port in constant communication with said supply passage and a delivery port in constant communication with said delivery passage, and a relief port in constant communication with said relief passage on the opposite side of said piston head, said piston head being subject on said one side to the fluid under pressure in said delivery passage and on the said opposite side to biasing forces of spring means, and

(c) a control slide valve slidably positionable within the tubular body of said hollow control piston in a selected one of a plurality of positions to establish a first communication between said supply port and said delivery port and operable cooperatively with said hollow control piston upon movement of said hollow control piston responsively to fluid pressure in said delivery passage acting on the said piston head in opposition to said spring means to cut off said first communication, and operable cooperatively with said hollow control piston responsively to a further increase of fluid under pressure in said delivery passage acting on said piston head in opposition to said spring means to establish a second communication between said delivery port and said relief port, to thereby regulate to a certain pressure the pressure of the fluid delivered from said supply passage to said delivery passage of said valve body according to the selected one of said positions of the control slide valve.

3,272,221
CONVERTIBLE VALVE DEVICE
Francis S. Flick, Oak Park, and Richard M. Morgan, River Forest, Ill., assignors to Flick-Reedy Corporation, a corporation of Illinois
Filed Nov. 8, 1963, Ser. No. 322,355
6 Claims. (Cl. 137—270)

1. A self-contained valve package for normally open, normally closed, spring-centered and momentary impulse operation in selective alternative, comprising:

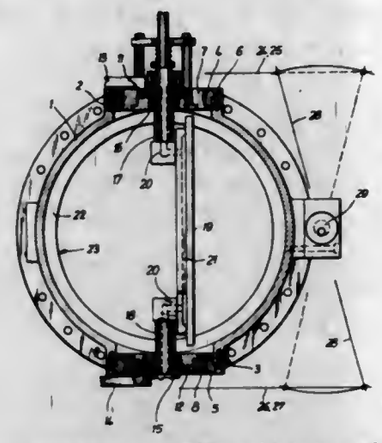


an elongate valve body having a longitudinal bore and longitudinally spaced ports and passages communicating the bore with the exterior of the valve body,

a valve spool slidable in the bore for selective connection and closing of the passages,

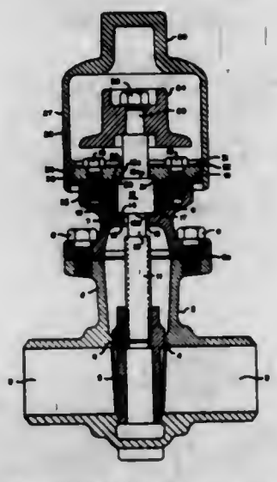
a removable closure for each end of the valve body,

a valve spring and a valve spring cage means mounted in tandem between the valve spool and said closure, said spring having one end of a size to enter the valve body bore and an opposite end of a size to extend about the cage means, said cage means and spring being serially arrangeable for engagement with and between the valve spool and closure and for engagement with and between the valve body and closure alternatively to provide said valve operations selectively.



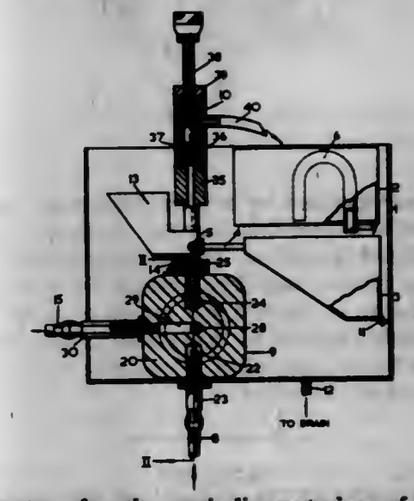
3,272,222
BLOWOUT PREVENTER
Herbert Allen, Houston, Tex., assignor to Cameron Iron Works, Inc., Houston, Tex.
Filed Oct. 28, 1963, Ser. No. 319,284
7 Claims. (Cl. 137—315)

1. A blowout preventer, comprising a body having a bore therethrough and guideways therein extending laterally from opposite sides of the bore, a bonnet detachably connected across the outer end of each guideway of the body for closing same, a cylinder in each bonnet and a piston reciprocable in each cylinder, a ram connected to each piston on the inner side of the bonnet for reciprocation of the ram toward and away from the bonnet so as to open and close the bore when the bonnet is connected to the body in normal preventer operation, cylinder means in each bonnet in side-by-side relation to the first-mentioned cylinder and piston means reciprocable within said cylinder means, means supporting each bonnet from the body and connected to the piston means within the cylinder means in said bonnet for reciprocation of the bonnet, upon detachment thereof from said body, between its position across the outer end of the guideway and a position spaced therefrom so as to withdraw the ram on said bonnet from its guideway, and means including fluid pasageways in each bonnet for introducing pressure fluid into the cylinder and cylinder means therein so as to move the bonnet between said positions and to move the ram between bore opening and closing positions during normal preventer operation and toward the bonnet prior to movement of the bonnet to guideway closing position.



3,272,223
ROTATABLE SHUTTER VALVE
Hans G. Sass, Krefeld, Rhineland, Germany, assignor to Firma Industrie-Companie Kleinewefers Konstructions- und Handelsgesellschaft m.b.H., Krefeld, Rhineland, Germany, a corporation of Germany
Filed June 3, 1964, Ser. No. 372,312
Claims priority, application Germany, June 12, 1963, J 23,866
16 Claims. (Cl. 137—340)

1. In a shutter valve having a body through which extends a passageway for flow of a fluid therethrough, said passageway having an inlet and an outlet, a body seat interposed between said inlet and outlet, the invention comprising a disk disposed in said passageway and movable into and out of engagement with said seat for regulation of flow of said fluid through said valve, a shaft joined to said disk and having a mounting upon said body which permits rotation of said disk about an axis disposed substantially transversely of the central axis of an opening formed by said body seat, rotation of said disk about said axis of rotation including placing same in a plane substantially parallel to the plane of said body seat, said mounting including first and second rotatable eccentrics, said first eccentric being concentrically disposed within said second eccentric, each eccentric having a major portion and a minor portion, said eccentrics being rotatable about their axes of rotation independently of said disk and being rotatable in opposite directions to each other, rotation of said two eccentrics in opposite directions to each other moving said disk along a path substantially normal to the plane of said seat between a first position whereat said disk is in engagement with said seat and a second position whereat said

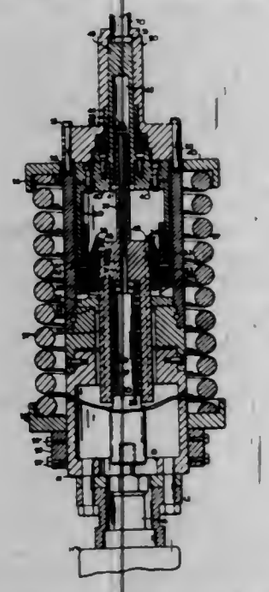


disk is out of engagement with said seat, said eccentrics being so disposed relative to each other that when said disk is in said first position, said minor portion of each eccentric is closer to the plane of said seat than said major portion of each eccentric, and that when said disk is in said second position, said minor portion of each eccentric is farther from the plane of said body seat than when said disk is in said first position.

3,272,224
HOODED GAS DISTRIBUTION VALVE FOR UNDERGROUND USE
Edward N. Wrenshall, Ross Township, Allegheny County, Pa., assignor to Miller Printing Machinery Co., Pittsburgh, Pa., a corporation of Pennsylvania
Continuation of application Ser. No. 250,354, Jan. 9, 1963. This application Feb. 25, 1965, Ser. No. 435,295
2 Claims. (Cl. 137—382)

1. A valve for underground use comprising a casing having a passage therethrough, a valve element movable between an operative position closing said passage and an inoperative position in which said passage is open, a stem turnably mounted in the casing with an end of the stem projecting out of the casing, connections between the stem and the valve element for moving the valve element between said positions upon turning of the stem, means for turning the stem through application of turning force to the end of the stem projecting out of the casing, the casing having fastened thereto in fixed position relatively thereto a separate member through which the end of the stem projecting out of the casing extends, means removably fastening said member to the casing, said member being sealed to the casing, said means being protected against ingress of moisture from the outside between said member and the casing by the means sealing said member to the casing, said member being provided with means for attachment of a hood thereto, and a hood having means whereby when the hood is in operative position it is attached to said member through said means, the hood also having means whereby when it is in operative position it is sealed to said member whereby the hood is mounted on the casing and protectively covers the end of the stem projecting out of the casing, the hood being removable from said position to permit access to the end of the stem projecting out of the casing for operation of the valve.

3,272,225
APPARATUS FOR WATERING PLANTS
Ronald C. Frampton, Ringwood, England, assignor to MacPennys Mist Propagation Limited, Ringwood, England
Filed Feb. 26, 1964, Ser. No. 347,477
Claims priority, application Great Britain, Mar. 2, 1963, 8,452/63
5 Claims. (Cl. 137—408)

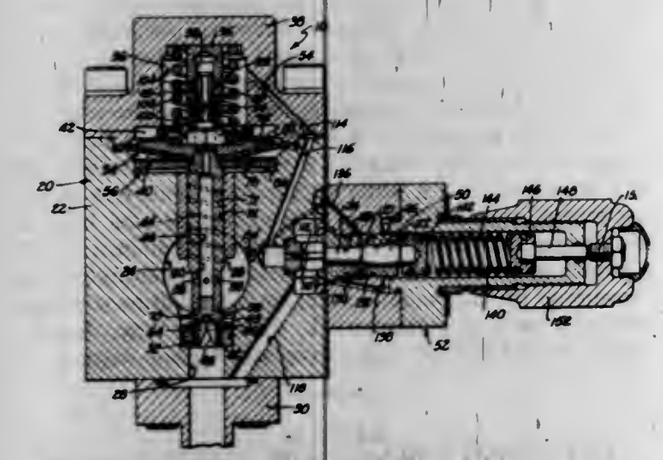


1. Apparatus, for the periodic watering of plants or for periodic irrigation, comprising a syphon tank; a feed device, arranged to be connected to a water supply and to discharge into said syphon tank, for controlling the rate of flow of water from said supply to said syphon tank; a syphon tube positioned within the syphon tank and so arranged therein as to empty water from said syphon tank, when a predetermined depth of water has collected therein; a balance tank arranged beneath the discharge end of said syphon tube to receive the water discharged therefrom, said balance tank having an outlet permitting restricted flow therefrom; a balance arm on which said balance tank is mounted and a valve for controlling the flow of water from a water supply to at least one watering means, said valve being held closed by said balance arm, when said balance tank contains less than a datum quantity of water, and being permitted to open by pivotal movement of said balance arm, by the additional weight of water in said balance tank, when the latter has received a discharge of water from said syphon tube.

3,272,226
ANTI-SIMMER DEVICE FOR RELIEF VALVES
Donald P. Dunlop, Weston, Ontario, and Raymond W. Cousins, King City, Ontario, Canada, assignors to Atomic Energy of Canada Limited, Ottawa, Canada
Filed July 10, 1964, Ser. No. 381,676
6 Claims. (Cl. 137—478)

1. In a pressurized system having a relief valve including a stem and a first resilient means biasing it toward a normally closed position, said valve being adapted

to open when pressure in said system reaches a selected value and close when pressure falls below the selected value; an anti-simmer device mounted rigidly with respect to said relief valve and having a first member selectively movable normally locking said valve in a selected position, said device including a second resilient means interposed between said first member and said valve normally urging said valve to a closed position,



latch means operated by a second member into locking engagement with said first member to maintain said valve in said closed condition, means responsive to system pressure to release said latch means when said selected system pressure is reached and means to cause said pressure responsive means to cause said latch means to reengage aid valve stem when pressure in said system falls below the selected value.

3,272,227

PILOT OPERATED PRESSURE REGULATOR

Carter P. Williams, La Crescenta, Calif., assignor to Kobe, Inc., Huntington Park, Calif., a corporation of California

Filed Feb. 17, 1964, Ser. No. 345,247
6 Claims. (Cl. 137—491)

1. In a pressure regulator for maintaining a substantially constant fluid pressure in a high pressure system relative to the fluid pressure in a low pressure system, the combination of:

(a) a housing having high pressure and low pressure passages respectively connectible to the high pressure and low pressure systems;

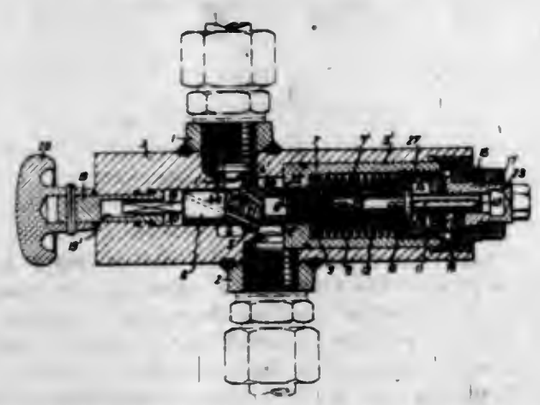
(b) main valve means in said housing and interconnecting said high pressure and low pressure passages and including a main valve movable from a closed position to an open position to bypass fluid from said high pressure passage to said low pressure passage;

(c) main actuating means located in said housing, and connected to said main valve, and operable by a main fluid pressure differential acting between opposite sides thereof, for moving said main valve from its closed position toward its open position;

(d) said main fluid pressure differential being equal to a difference between a fluid pressure acting on one of said sides of said main actuating means and biasing said main valve toward its open position and a fluid pressure acting on the other of said sides of said main actuating means and biasing said main valve toward its closed position;

sure passage to said one side of said main actuating means and the other connecting said high pressure passage to said other side of said main actuating means;

(f) differential-area pilot valve means including metering means in said housing, and connecting said other side of said main actuating means to said low pressure passage, and openable by a pilot fluid pressure differential equal to a predetermined difference between the fluid pressures in said high pressure and low pressure passages, and exposed solely to the fluid pressures in said high pressure and low pressure passages, for reducing the fluid pressure on said other side of said main actuating means to a value below that on said one side thereof so as to produce said main fluid pressure differential, and thus cause said main actuating means to move said main valve from its closed position toward its open position; and



(g) metering valve means in and controlling flow through said other passage means, and including a metering valve connected to said main actuating means, for decreasing the resistance to flow from said high pressure passage through said other passage means to said other side of said main actuating means as said main valve is moved from its closed position toward its open position.

3,272,228

CROSS-CONNECTION VALVE

Bernard Jorgji, Hamburg-Lokstedt, and Karl Hinsch, Hamburg, Germany, assignors to Licentia Patent-Verwaltungs-G.m.b.H., Frankfurt am Main, Germany

Filed Feb. 13, 1964, Ser. No. 344,648
10 Claims. (Cl. 137—493)

1. In a piston valve device providing a safety cross-connection between a feed conduit and a return conduit in hydraulic machines disposed in a system having a closed hydraulic flow path, the improvement comprising:

spaced first and second conduit connections;

means defining a valve piston cylinder which is in communication with said conduit connections;

a valve seat disposed in said valve piston cylinder and via which said conduit connections may be in communication with each other;

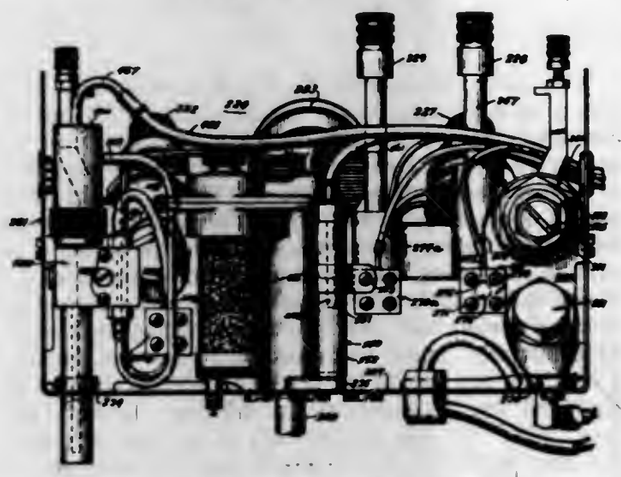
a valve piston having a neutral position in said seat and blocking communication between said conduit connections and movable toward two positions one on each side of said seat to permit communication between said conduit connections;

means defining a spring cylinder having a stop surface at each end;

a valve piston rod extending from both sides of said piston and supported on both sides thereof;

two spaced-apart stop members disposed in said spring cylinder for movement with said piston;

resilient means including a single spring element disposed in said spring cylinder between said stop members and restrained from axial expansion by said stop surfaces when said piston is in its said neutral position, each of said stop members being arranged to act on a respective end of said spring to compress said spring when said piston moves toward a respective one of said two positions on each side of said seat to resist movement of said piston rod and thus of said piston out of its neutral position; and



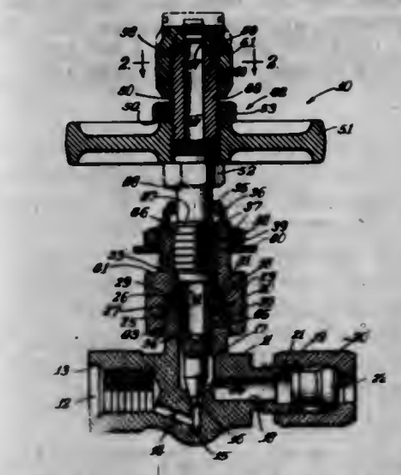
pressure differential means acting on the piston for exerting pressure on one side of the spring element depending upon the differential pressure.

3,272,229

CONTROL UNIT FOR AIR DRIVEN DENTAL HANDPIECES

Martin Staunt, Des Plaines, Ill., assignor to American Hospital Supply Corporation, Evanston, Ill., a corporation of Illinois

Original application Mar. 12, 1959, Ser. No. 798,866. Divided and this application June 10, 1965, Ser. No. 469,028
5 Claims. (Cl. 137—544)



1. A supply system for air driven dental handpieces, comprising a base casting having a first conduit with a threaded inlet bore to be connected to a supply of air provided by an air compressor, said first conduit extending to an enlarged bore communicating with a smaller counterbore, an air filter assembly having a cylindrical plug provided with an O ring engaging in said counterbore to seal one open end thereof, said plug having a bore communicating with a second inlet forming an outlet for the filter, a tube in said bore, a cap on the end of said tube, a filter element on said tube receiving air from said enlarged bore and passing air inwardly to apertures in said tube, and a transparent cylinder mounted between said casting and said cap and establishing a closed container about said filter element, said casting having a second enlarged threaded bore communicating with the outlet of the filter assembly, and a pressure regulator valve in said second enlarged bore communicating with a third conduit for discharging filtered air at reduced pressure to a pair of enlarged bores each containing a solenoid valve controlling air.

3,272,230

GAGE VALVE

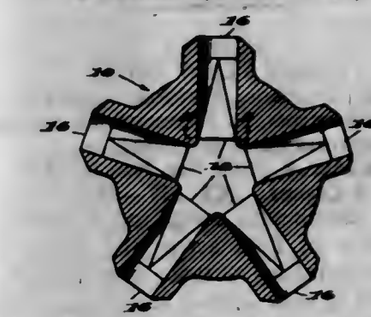
Carl Bolling, Chicago, Ill., assignor to Imperial-Eastman Corporation, a corporation of Illinois

Filed Jan. 24, 1964, Ser. No. 339,956
8 Claims. (Cl. 137—557)

1. In a gage valve including a body having a first fluid passage defining a valve seat, a valve structure extending into said body for selectively opening and closing said first fluid passage across said valve seat, and means defining a second fluid passage communicating with said first fluid passage downstream of the valve seat and defining an outlet, structure comprising:

a closure;

means for removably securing said closure to said valve structure for selectively closing said outlet; and

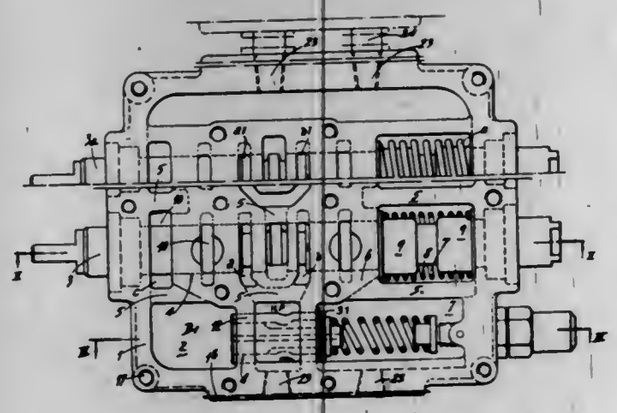


means responsive to a movement of said closure from the arrangement wherein said closure closes said outlet for jetting fluid from said second passage into the atmosphere at a velocity substantially greater than the velocity thereof through said second passage thereby to provide a pronounced signal of said movement only in the event that said movement is effected with the valve structure spaced from said valve seat to open said first fluid passage, said fluid jetting means comprising a passage having a transverse cross section smaller than the transverse cross section of said second passage.

3,272,231

APPARATUS FOR DIVIDING FLOW

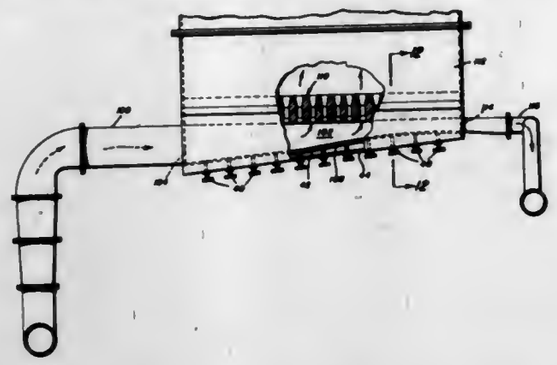
Richard Donnan Livingston, Seaford, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware



Filed Mar. 5, 1964, Ser. No. 349,635
8 Claims. (Cl. 137—561)

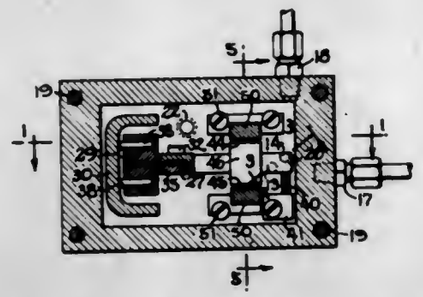
1. An improved flow splitter apparatus for the distribution of a viscous liquid from a single inlet to a plurality of outlets which comprises a body member having a single

inlet port therein, a plurality of equi-spaced, coplanar discharge ports substantially perpendicular to the axis of said single port and each having a circular exit portion and tapering to a rectangular cross-section in contact with said single inlet port.



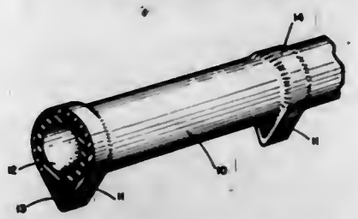
3,272,232
DISTRIBUTION BLOCK FOR HYDRAULIC VALVE
Roger Laumont, Nogent-sur-Marne, France, assignor to Hydro-Meca, Paris, France, a company of France
Filed Nov. 12, 1963, Ser. No. 323,006
Claims priority, application France, Nov. 16, 1962, 915,665, Patent No. 1,347,205
9 Claims. (Cl. 137—596.12)

1. A distribution block for a hydraulic control valve, of the type enclosing high precision sliding elements movable in chambers and defining interconnecting channels, passages, ducts and the like, which require liquid tight sealing between all moving and all fixed parts, comprising a casing formed of walls of cast metal in box-like shape and open at one side, at least two parallel, spaced partitions crossing said casing between a pair of opposite sides for housing between them a movable element, a flange on said partitions having perforations and partially closing said open side, said two partitions being connected by cross-bars which are also connected to the closed side of the casing and to said flange, said casing partitions, flange and cross bars being integrally formed in one piece, said partitions and cross bars having slots therethrough so as to form with said casing a honeycombed structure for receiving said movable elements and pressure fluid channels defining hydraulic circuits emerging in the open side of the casing through said perforations of the flange, and a support cover closing said casing and perforations of said flange, said cover being less mechanical resistant to bending and twisting than the casing and having openings for connecting pressure fluid ducts for the channels of the casing.



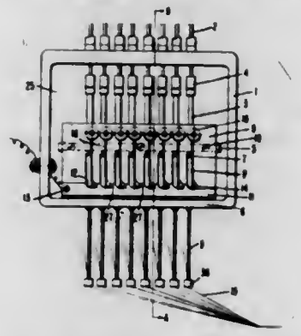
3,272,233
TAPER FLOW INLET
Alton D. Trufitt, Ivanhoe, Victoria, Australia, assignor, by mesne assignments, to Diamond International Corporation, a corporation of Delaware
Filed Mar. 8, 1963, Ser. No. 263,803
8 Claims. (Cl. 137—599)

1. In a fluid distributing device for delivering an even and uniform flow of fluid across the width of a fluid piping system comprising a taper flow header, an inlet adjacent one end of said tapered header, an overflow outlet at the other end, and a distributor along its length having a multiplicity of relatively uniformly spaced openings therein to receive a major portion of fluid flow angularly from said inlet, the improvement comprising a relatively flat adjustable wall comprising the tapered wall of said taper flow header and seal means along said tapered



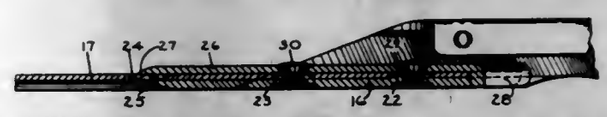
wall at each of the sides thereof running the length of said wall.

3,272,234
MAGNETICALLY CONTROLLED VALVE
George E. Parker, Rockford, Ill., assignor to Woodward Governor Company, Rockford, Ill., a corporation of Illinois
Filed May 13, 1964, Ser. No. 367,110
7 Claims. (Cl. 137—625.65)



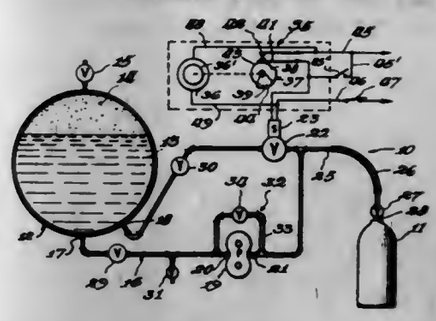
1. A valve construction having, in combination, a leaf spring of substantial width fixedly anchored at one end cantilever fashion, a valve member projecting from and supported by the free end of said spring for movement in a plane accurately defined by flexing of the spring and in opposite directions away from and toward a predetermined centered position, said member having a side surface paralleling said plane and terminating in an edge facing in one direction along the plane and a second surface paralleling said plane and terminating in a second edge laterally spaced from said first edge and facing in a direction opposite to the first edge, sources of relatively high and low pressures, means defining a passage communicating with said low pressure source and terminating in a first stationary port disposed opposite and closely adjacent said first surface but out of rubbing contact therewith, said port being covered by said first surface when said member is disposed in said centered position or to one side thereof, but opened progressively in the movement of the member in one direction away from such position, means defining a passage communicating with said high pressure source and terminating in a second port laterally spaced from said first port and disposed opposite and closely adjacent but out of rubbing contact with said second surface so as to be covered when said member is in said centered position and opened progressively in the movement of the member in the opposite direction away from such position, a fluid filled pressure chamber enclosing said member and said ports, and means for moving said member in said plane by flexing of said leaf spring and thereby admitting pressure fluid to said chamber through said second port or releasing fluid from the chamber through said first port.

3,272,235
HOSE AND SUPPORT THEREFOR
Benjamin Haytock III, Fairview, and Charles Stowell, Erie, Pa., assignors to Continental Rubber Works, Erie, Pa., a corporation of Pennsylvania
Filed Oct. 23, 1963, Ser. No. 318,345
4 Claims. (Cl. 138—107)



1. A hose and suspension devices attached thereto comprising
a hose having the outside surface thereof made of vulcanizable material,
and suspension devices comprising loops slightly larger in diameter than said hose disposed around said hose and at spaced intervals thereon,
said loops being made of vulcanizable material compatible with said hose and vulcanized thereto whereby said suspension devices are integral with said hose.

3,272,236
MECHANISM FOR THE CONTROL OF WEFT THREADS IN SHUTTLELESS LOOMS
Victor Marie Joseph Ancet, Villa Santa-Lucia, Golfe-Juan, Alpes Maritime, France, and Marius Fayolle, also known as Marcel Fayolle, 5 Rue de l'Humilelte, Lyon, Rhone, France
Filed Sept. 23, 1964, Ser. No. 398,553
Claims priority, application Spain, Sept. 25, 1963, 291,978
3 Claims. (Cl. 139—122)

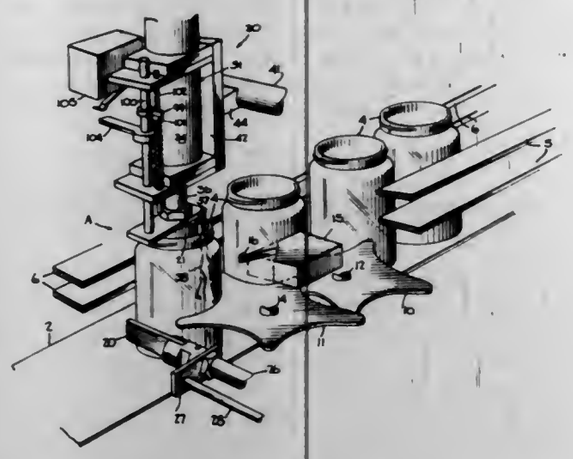


1. Improved mechanism, for use with a selective weft thread control, a contact activated by intermittences in synchronism with the mechanism and connected to a loom and a weft carrier clamp for pulling selected threads through a shuttleless loom, to stop the loom in the absence of any one weft thread comprising: a plurality of mounted rod dies individually operatively connected at one end to the selective weft thread control; said dies being vertically displaceable under operation of the control, each die having an elbow adjacent the lower end thereof; a thread guide attached to the lower end of each die; each guide having a weft thread passing therethrough; a finger attached to each rod die and extending radially therefrom, each thread guide and finger attached to their respective selected die radially rotating under tension from the clamp pulling on the thread passing through the guide; means limiting the vertical and radial movements of each finger; mounted spring means biasing each finger against raidal rotation, and counter-rotating each finger in the absence of any thread tension; a mounted electrical contactor connected to the contact, upstanding portions formed integrally of the contactor, one each for each finger; and fingers biased to counter-rotate in the absence of their respective thread touching their associated upstanding portion, so that when a selected weft thread is absent for any reason the loom stops.

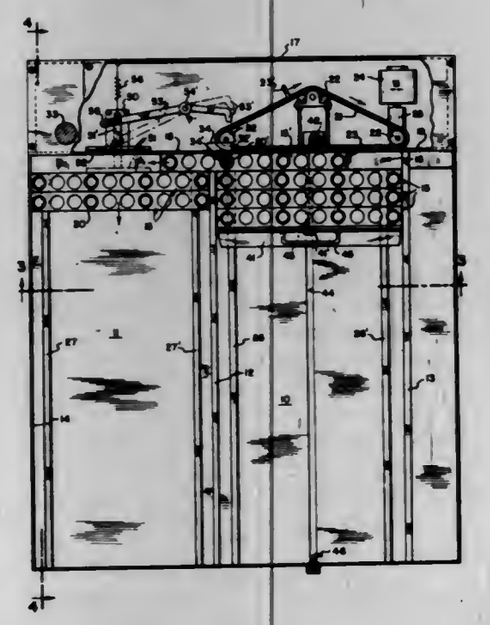
3,272,237
FILLING CARRIERS FOR SHUTTLELESS LOOMS
Paul C. Consoletti, Milford, Mass., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine
Filed Feb. 8, 1965, Ser. No. 430,929
6 Claims. (Cl. 139—122)

1. For a shuttleless loom having reciprocable filling placing members by which picks of filling are introduced from a stationary outside source into sheds formed of warp threads, the free end of each one of said placing members having apertures longitudinally spaced therethrough, a filling carrier including an upwardly deflecting trailing end, at least one positioning boss formed with said carrier and adapted to be encompassed by said aperture, and fastening means whereby said carrier may be detachably secured to said filling placing member.

3,272,238
METHOD AND APPARATUS FOR FILLING VESSELS
Alvin F. Groppe, Oak Lawn, Ill., assignor to Chemetron Corporation, Chicago, Ill., a corporation of Delaware
Filed Oct. 24, 1963, Ser. No. 318,617
7 Claims. (Cl. 141—5)



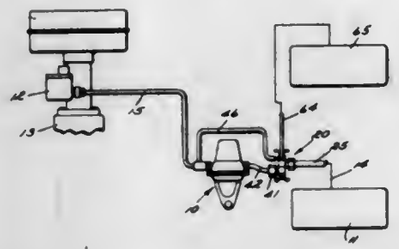
6. Method for filling a vessel with vaporizable liquid and for filling another vessel with vapor, comprising the steps of: pumping vaporizable liquid from a storage tank through a conduit, alternately diverting the pumped liquid into a vessel and diverting vapor formed in the vessel to a bottling station to fill vapor into another vessel, vaporizing additional liquid from the storage tank when the vapor available to the bottling station is insufficient, and conducting the additional vapor to the bottling station.



3,272,239
HEADSPACER FOR CONTAINERS
Frederick V. Hildebrandt, Charles S. Ochs, and George J. Foss, all of Lancaster, Ohio, assignors to Anchor Hocking Glass Corporation, Lancaster, Ohio, a corporation of Delaware
Filed Jan. 22, 1964, Ser. No. 339,847
14 Claims. (Cl. 141—168)

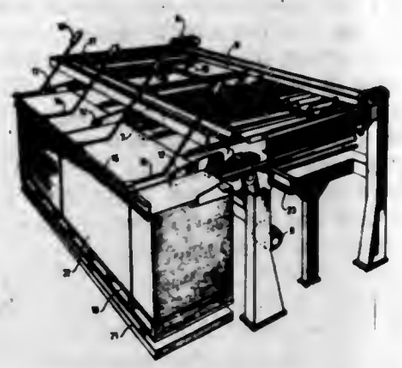
1. A machine for providing headspaces in overfilled containers comprising the combination of a conveyor for moving randomly spaced containers to a head-spacing station, a sensor positioned adjacent to the path of said moving containers, means for guiding said containers past the said sensor whereby each container operates the sensor, a container stop, first drive means responsive to said sensor for moving said container stop for stopping a container at said headspacing station, a headspacing

member, second drive means responsive to the actuation of said sensor for inserting said headspacing member into a container for providing an adequate headspace therein, means activated by said headspacing member for actuating said second drive means for withdrawing the headspacing member from the container and to initiate the removal of said stop from engagement with the container by said first drive means.

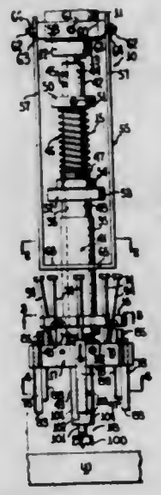


3,272,240
CONTAINER FILLING TRANSFER MECHANISM
Wilfred Roth, 58 Brainard Road, West Hartford, Conn.
Filed Nov. 15, 1963, Ser. No. 323,947
8 Claims. (Cl. 141—176)

1. A transfer mechanism for containers to be filled by filling means at a filling point which comprises
(a) a plurality of container racks for supporting respective rows of containers,
(b) a rack tray having side-by-side input and output channels for movably supporting said container racks in side-by-side relationship therein,
(c) a transfer section at one end of said rack tray extending across said input and output channels,
(d) drive means at said transfer section for successively transferring therealong racks received from the input channel,
(e) indexing means for controlling said drive means to interrupt the movement of a rack along said transfer section as each container therein arrives at a predetermined filling point therealong,
(f) means for moving racks in said input channel toward said transfer section after each leading rack is transferred away from the front of the input channel,
(g) and means for successively moving transferred racks away from said transfer section into said output channel.



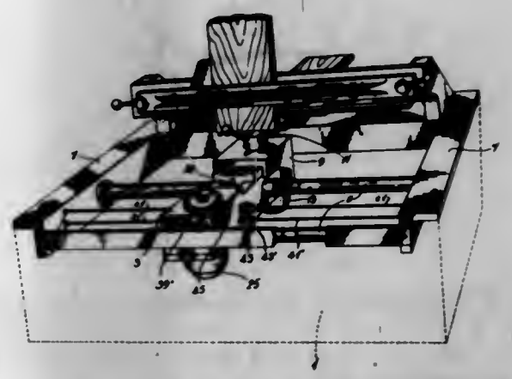
3,272,241
FUEL EXCHANGER DEVICE
Samuel Wagner, 2405 Hillsdale Drive E., Brookfield, Wis.
Filed Apr. 13, 1964, Ser. No. 359,309
5 Claims. (Cl. 141—388)



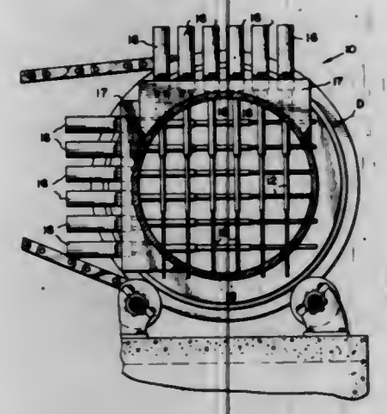
1. In a system for transferring liquid fuel from a receptacle to the tank of an automotive vehicle having a fuel tank, an internal combustion engine, a fuel pump and lines connecting said tank, engine and pump for pumping fuel from said tank to said engine, when the latter is running, a fuel exchanger device comprising
a multi-passaged valve body in the line between said tank and said pump,
a first connection from the discharge side of said pump to said valve,
a second connection from said valve to said receptable and valve means associated with said valve body for opening passages through said valve body establishing flow communication from said receptacle to said pump and from said pump to said tank while closing communication between said tank and the intake side of said pump,
whereby said pump can be operated to transfer fuel from said receptacle to said tank while said engine is running.

3,272,242
DEVICE FOR SAWING AND STACKING SHEET MATERIAL
Johannes Hans Bäuml, Sundsvall, Sweden, assignor to Aktiebolaget Mohogs Mekaniska Verkstad, Sundsvall, Sweden, a company of Sweden
Filed Apr. 30, 1964, Ser. No. 365,235
Claims priority, application Sweden, May 3, 1963, 4,908/63; June 20, 1963, 6,904/63
2 Claims. (Cl. 143—48)

1. A device for the sawing and subsequent stacking of wood fibre board and similar slabs, comprising a transport table, a plurality of saw blades mounted on saw carriages that are movable laterally at one side of said table to allow sawing various sizes, a feeder for feeding the slabs during the sawing, said feeder having a plurality of feeding arms arranged to engage with the rear edges of the slabs, seen in the direction of feeding, a stacking device for the sawn slabs arranged after the sawing device, seen in the direction of feeding, said stacking device comprising at least two vertical shafts, the feeding arms being movable laterally, depending on the position of the saw blades, so as to move in paths between the saw blades, and being arranged to move forward as far so to push the sawn slabs into the desired position in the shafts, vertical plates supported by said saw carriages in alignment with the saw blades, said vertical plates constituting thin partitions between said shafts.

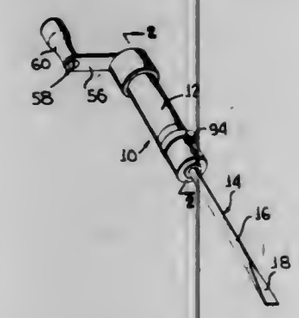


3,272,243
PLUG CUTTER
Frank W. Hayes, Sr., 4017 Carol Drive, Jackson, Miss.
Filed Oct. 11, 1963, Ser. No. 315,633
8 Claims. (Cl. 144—20)



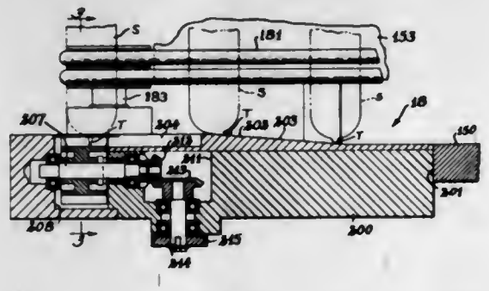
1. A cutter mechanism comprising a rotatable cutter unit adapted for cutting a disc-like article having upper and lower surfaces and an exterior frusto-conical portion terminating at a point spaced from said lower surface at an exterior cylindrical shoulder, said cutter unit comprising first and second cutter means, said first and second cutter means having cutting portions normally disposed in coaxial relationship, said first cutter means being normally disposed radially inwardly of said second cutter means, said first cutter means being operative for cutting an exterior frusto-conical portion of a disc-like article, said second cutter means being operative for cutting an exterior cylindrical shoulder of the article which intersects the exterior frusto-conical portion at a point spaced from the lower surface thereof, said cutting portions of the first and second cutter means normally defining generally coaxial hollow annular cylindrical volumes in a first relative position thereof upon the rotation of said cutter unit, means for progressively shifting the cutting portion of said first cutter means radially outwardly toward said second cutter means, and means for controlling the shifting means for causing the hollow, annular cylindrical volume of the first cutter means to be transformed into a generally hollow annular frusto-conical volume which intersects the hollow annular cylindrical volume of the second cutter means at a point spaced from the lower surface of the article and at a major radius portion of the hollow annular frusto-conical volume whereby the article is provided with an exterior frusto-conical portion merging with an exterior cylindrical shoulder at a point spaced from the lower surface of the article.

3,272,244
DOVETAILING MACHINE
Joseph Nemec, Cite St-Laurent, Quebec, Canada, assignor of fifty percent to Nicholas Monastyrsky, Montreal, Quebec, Canada
Filed Oct. 2, 1963, Ser. No. 313,207
8 Claims. (Cl. 144—87)



1. A machine for imparting to a cutting tool the harmonic motion necessary to produce dovetail cuts, comprising:
(a) a machine base;
(b) a carrier mounted on said machine base for longitudinal displacement thereon;
(c) a work holding device mounted on said machine base and transversally offset from said carrier;
(d) a cutting tool assembly mounted on said carrier for transversal displacement thereon;
(e) a first device for translating circular motion into rectilinear transverse motion and for communicating the latter to the cutting tool assembly and thereby setting same into reciprocal motion;
(f) a second device for translating circular motion into rectilinear longitudinal motion and communicating the latter to the said carrier;
(g) a means for absorbing one of the directional components of rectilinear longitudinal motion and thereby prevent communication thereof to the said carrier;
(h) first power means to produce said circular motion;
(i) second power means for rotating said cutting tool;
(j) said first device comprising:
a first rectangular frame on said carrier and transversely slidable thereon;
a first block longitudinally slidable on said first rectangular frame;
a rigidly secured connection linking said first rectangular frame and said cutting tool assembly;
a first circular rotatable eccentric connected to a rotating shaft for action on said first block;
(k) said second device comprising:
a second rectangular frame on said carrier and longitudinally slidable thereon;
a second block transversely slidable on said second rectangular frame;
a unidirectional clutch device secured to the machine base for action on said second rectangular frame to prevent motion of said second rectangular frame in one longitudinal direction;
a second circular rotatable eccentric connected to a rotating shaft for action on said second block.

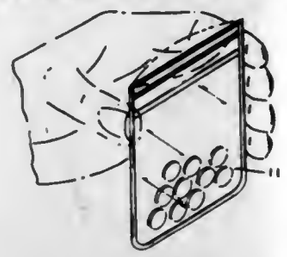
3,272,245
BARKING DRUM
George M. Dick, Sherbrooke, Quebec, Canada, and Gladstone H. Kapralos, Flushing, N.Y., assignors to Canadian Ingersoll-Rand Co., Ltd., Montreal, Quebec, Canada, a corporation of Canada
Filed Apr. 29, 1964, Ser. No. 363,515
15 Claims. (Cl. 144—208)



1. A barking drum for debarking logs, comprising;
(a) a cylindrical shell for receiving said logs;
(b) said cylindrical shell being provided with at least two sections; and
(c) means for positively controlling the length of time that said logs stay in each of said sections.

3,272,246
HAND TOOL WITH AXIALLY MOVABLE CLUTCH MEANS
Emil Bohnet, 204 Ontario St., Buffalo, N.Y.
Filed Aug. 10, 1964, Ser. No. 388,658
6 Claims. (Cl. 145—76)

1. A hand tool of the character described, comprising an elongate handle having an axial bore therethrough and having a rear end and a forward end, a cap on and rotatably engaged with said rear end, an elongate driver element having a tang and a means at one end adapted for connection with a rotatable element, a pair of clutch members each having a passage therethrough, the passages of said members being aligned and having said tang extending therethrough and through said bore of the handle, means attaching the tang at its other end to said cap, one of said clutch members being carried by the forward end of the handle, means releasably securing the other clutch member to the tang, said clutch members having opposing faces adapted to be placed in substantially abutting relation, at least two pin members projecting from one of said clutch faces, the other clutch face having sockets for snugly receiving said pins in the clutch engaged position of the members, a skirt encircling and secured to one of said members and projecting therefrom to an extent to enclose a portion of the other member when the clutch members are engaged, and spring means within the handle bore and retained under tension between the cap and the handle carried clutch member and constantly urging the handle in a direction to engage the clutch pins in said sockets, and the handle being retractable against the tension of the spring means for disengaging the pins from their sockets and also being rotatable on the tang when said pins are disengaged from said sockets, a cylindrical shell enclosing the clutch secured to the tang and having an open end directed toward the hand carried clutch member and being slidable on the enclosed clutch member, means for securing the shell against movement on the enclosed clutch member when in non-working position thereon whereby said handle is freely reciprocable on the tang for engaging and disengaging the clutch members, and said shell securing means being adapted to secure the shell in a second position with respect to the enclosed clutch member wherein the shell has an operative connection with the handle and holds the handle against reciprocable movement and holds the clutch members in disengaged relationship.



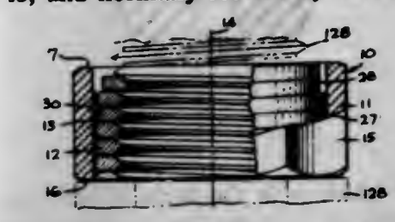
3,272,247
SAUSAGE END TRIMMING MACHINE
Andrew H. Vedvik, Madison, Wis., assignor to Oscar Mayer & Co., Inc., Chicago, Ill., a corporation of Illinois
Original application Jan. 29, 1963, Ser. No. 254,745, now Patent No. 3,217,766, dated Nov. 16, 1965. Divided and this application July 20, 1965, Ser. No. 473,448
5 Claims. (Cl. 146—81)

1. Apparatus for handling small sausages which have small tip forming portions projecting from the ends thereof, said apparatus comprising a traveling conveyor disposed generally horizontal and having upper and lower conveyor members with confronting runs between which the sausages are confined for advance in transversely extending, side-by-side arrangement, cutter mechanism at opposite sides of the conveyor, each said cutter mechanism comprising a vertically disposed plate with a longitudinally extending guide slot positioned in the path of an end of the sausages for accommodating the projecting tips, said slot terminating at its leading end in an aperture providing an opening into a cutter housing, a cutter wheel mounted in the cutter housing for rotation on an axis extending in the direction of travel of the conveyor and carrying one or more knives for cutting off the sausage tips which extend through said aperture, and means for rotating said cutter wheel.

3,272,248
CLOSURE FOR FLEXIBLE RECEPTACLES
Frank J. O'Farrell, 10711 Whitburn, Culver City, Calif.
Filed May 4, 1965, Ser. No. 452,992
2 Claims. (Cl. 150—10)

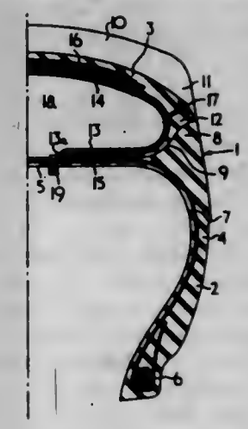
1. In a bag that is completely closed excepting for an elongated knob formed by superimposing adjacent edge portions of the material of the bag a pair of stays so positioned and attached to said material that it is superimposed over the stay along the edge of the mouth, each

of said stays so formed of resilient material that it is inherently spring-loaded to lie flat, the surfaces of the stays that face each other having relatively small pit-like indentations therein.



3,272,249
LOCKING DEVICE FOR USE ON SUSPENSION CLAMPS AND THE LIKE
Herbert J. Houston, Oakville, Ontario, Canada, assignor to Slater Steel Industries Limited, Hamilton, Ontario, Canada
Filed July 30, 1964, Ser. No. 386,129
Claims priority, application Canada, Sept. 9, 1963, 884,111
2 Claims. (Cl. 151—6)

1. A locking assembly for preventing the complete detachment of one member from another, said assembly comprising an externally threaded male member and a female member having an internally threaded wall and adapted to receive the male member in screw threaded engagement, a resiliently actuated locking element housed within said male member adjacent the threaded inner end thereof and held in normally closed position by said threaded wall, a recess formed in the exterior face of said female member, said recess being flared and generally segmental in shape, and terminating in a retaining wall for said element generally radially outwardly extending from the threaded wall and interrupting the thread of said female member, the distance measured from the threaded inner end of said male member to said locking element being greater than the depth of said recess by at least one thread turn, said recess adaptable to receive said element in locking engagement whereby upon retrograde movement of the male member to a predetermined extremity said element is urged outwardly of the axis of the male member and into locking engagement with said recess, thereby preventing further unscrewing of the assembly.

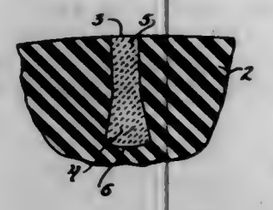


3,272,250
SELF-LOCKING NUT
Mark Hattan, Pasadena, Calif., assignor of sixteen percent to William P. Green, Pasadena, Calif.
Filed June 15, 1965, Ser. No. 464,160
9 Claims. (Cl. 151—21)

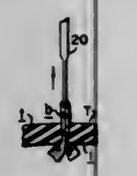
1. A lock nut comprising a case, an elongated thread element of resilient spring material located at least partially within said case, said element being coiled generally helically and having a radially inner portion forming an internal thread for engagement with a mating screw, means forming an essentially helical ramp carried by said case axially inwardly of said thread element for taking axially inward forces therefrom and having a shoulder preventing relative rotation of said element, a plurality of primary turns of said thread element being permanently bonded essentially rigidly to said case, and to one another and to said ramp, said thread element having a locking portion axially outwardly beyond said primary turns in a direction away from said ramp which is deformed to, and normally returns by its own resilience

to, a condition in which it deviates from a true helical continuation of any of said primary turns, said locking portion being free of direct rigid attachment to said case and being free for deformation against its resilience by a mating screw from said normal condition and toward closer coincidence with a true helical continuation of said primary turns.

3,272,251
PNEUMATIC TIRE
Alfred Harry Grossett, Lichfield, England, assignor to Dunlop Rubber Company Limited, London, England, a British company
Filed Nov. 24, 1964, Ser. No. 413,578
Claims priority, application Great Britain, Dec. 14, 1963, 49,482/63
4 Claims. (Cl. 152—188)



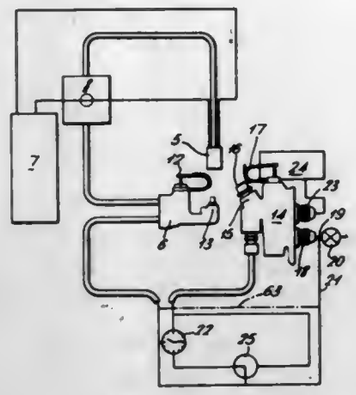
1. A pneumatic tire incorporating two side walls and a tread portion and comprising a radially inner inflatable component and a detachable inflatable radially outer component, the radially inner component having side walls forming at least a part of each side wall of the tire and an annular bridging portion extending between and joining said side walls of the inner component, the side walls of the inner component extending radially outwardly beyond the bridging portion to form an annular circumferential channel, said outer component comprising the tread portion of the tire and a base portion fitting in the annular channel of the inner component and being substantially inextensible in a circumferential direction.



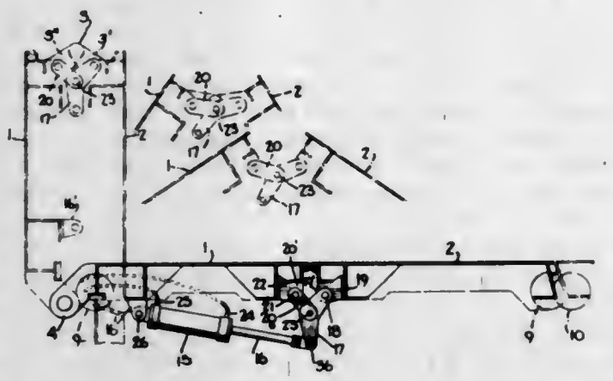
3,272,252
SNOW TIRE AND INSERT THEREFOR
Clarence E. Nordquist, Lakewood, Colo., assignor to Coors Porcelain Company, Golden, Colo., a corporation of Colorado
Filed Feb. 23, 1965, Ser. No. 434,379
3 Claims. (Cl. 152—211)

1. A tire for automative vehicles having a rubber tread with spaced inserts therein and exposed at the surface thereof, said inserts being shaped sintered ceramic bodies

having a density of at least about 3.9 g./cc. and containing at least about 99% by weight aluminum oxide substantially all of which is in the form of randomly oriented crystals having an average size not exceeding about 10 microns.



3,272,253
TIRE REPAIR INSERT
Horace B. Brose, 5013 N. Westshore Blvd., Tampa 3, Fla.
Filed Feb. 10, 1965, Ser. No. 431,623
4 Claims. (Cl. 152—370)



1. For repairing an injury opening in a tubeless tire, an elastic insert in the form of an elongated thin multiply wafer adapted to be forced in a folded, stretched and attenuated state into and, in part, through the tire injury opening to occupy fully the space therewithin and provide an effective seal therefor, comprising a base lamination of a cured rubber composition having a high tensile strength and a facing lamination of non-vulcanizable uncured soft and pliable rubber composition applied to each of the opposite faces of the base lamination, a spread of adhesive material devoid of any vulcanizing agent therein interposed between each facing lamination and the base lamination whereby intimate contact therebetween may continue indefinitely without inducing any vulcanizing of the facings, the adhesive material acting to mechanically join the several laminations into a unitary structure having an ample volume for an effective seal against leakage of air through the injury opening when the insert is forcibly fitted therewithin for adherence to the surrounding walls thereof.

3,272,254
IGNITION OF GAS BURNERS
Francis Hughes, Leamington Spa, and Stanley Ralph Williams, Oxfordshire, England, assignors to Sidney Flavel & Company Limited, Leamington Spa, England, a British company
Filed May 20, 1964, Ser. No. 368,930
Claims priority, application Great Britain, Oct. 3, 1963 38,910/63
4 Claims. (Cl. 158—125)

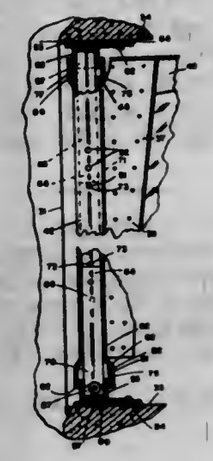
1. A gas-fired appliance incorporating means for controlling the lighting of a main burner comprising a single pilot burner, means for supplying gas to said pilot burner directly from a main supply, an igniter burner incorporating an electrically heated igniter filament, means for supplying gas to said igniter burner including a valve controlled by thermally responsive means influenced by the flame of the pilot burner, and means for controlling the electrical circuit of said igniter filament comprising a pressure-sensitive switch in a pipe line between said valve and said igniter burner, said switch breaking the circuit to said filament when the gas supply to the igniter burner is cut off by the closing of said valve by the thermally responsive means heated by the flame of the pilot burner.

3,272,255
POWER OPERATING MEANS FOR OPENING AND CLOSING HATCH COVERS
Gustave Stransky, New York, N.Y., assignor, by mesne assignments, to MacGregor & Company (Naval Architects) Ltd., Whitley Bay, Monkseaton (Northumberland), England
Filed Apr. 12, 1954, Ser. No. 422,470
17 Claims. (Cl. 160—188)

1. In a folding hatch cover arrangement for vessels, a coaming means surrounding a hatch opening, a pair of adjacent cover sections, hinge means mounting one end of one section relative to an edge of the opening, hinge means connecting the opposite end of said one section to the adjacent end of the other section, roller means carried at the remote end of said other section, guide means constraining the roller means and thus the remote end of said other section for movement toward and away from said edge of the opening, link means pivotally connected to the said opposite end of said one section, additional link means pivotally connected to the said adjacent end of of the said other section, pivot means interconnecting the link means with the additional link means, and reciprocable force applying means pivotally connected to said one section and to said interconnected link means for selective movement in opposite directions toward and away from said edge of the opening whereby responsive to movement of said force applying means and said link means, said sections move between a hatch opening and a hatch closing position.

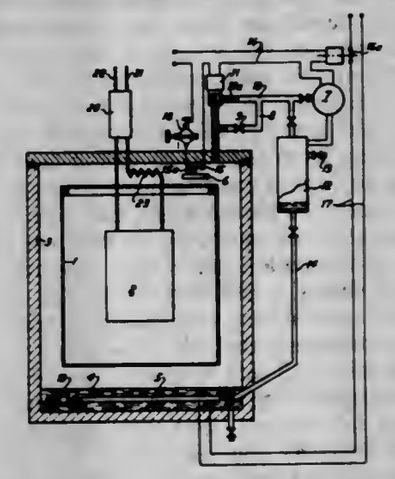
3,272,256
ROLLER SHUTTER AND IMPROVED METHOD OF MANUFACTURE THEREOF
Friedrich Griesser, Aadorf, Thurgau, Switzerland, assignor to Griesser A.G., Aadorf, Thurgau, Switzerland
Filed Mar. 2, 1964, Ser. No. 348,468
1 Claim. (Cl. 160—220)

In a roller shutter, the combination of a plurality of hollow slats of sheet material, flexible carrier tapes on which said slats are suspended, said slats each having a top portion which in cross-section has an upwardly convex wedge shaped cross-section with two oppositely inclined wall portions, and an upwardly concave bottom portion having in cross-section a substantially horizontal middle surface portion and sharply downwardly inclined end portions connecting the bottom portion to the side walls of the hollow slat, the top portion of the next lower slat projecting toward the space within the concave bottom portion of each next upper slat, the slats each being formed by a strip of sheet material bent to a tube, the longitudinal edges of said strip being united at said bottom portion of the slat, the apex of said top portion and the horizontal middle surface of the bottom portion having slots formed therein, and the flexible carrier tapes passing through said slots, said carrier tapes including laterally extending shoulder means for retaining said slats in a substantially horizontal position on said carrier tapes and outwardly and downwardly projecting tongue-like projections of material punched out of said carrier tapes at positions spaced longitudinally along the carrier tapes and adjacent at least one of the wall portions of each of the slats connecting the side walls of the slats, said tongue-like projections being resiliently movable toward the carrier tapes to enable the slats to be moved down along the tapes into position thereon and for preventing said carrier tapes from slipping through said slats, said carrier tapes being formed of individual fastening members with each fastening member having at least one of said tongue-like projections and said laterally extending shoulder means, said tongue-like projections each being capable of bearing against said middle surface portion of said concave bottom portion of an associated slat and said laterally extending shoulder means being capable of bearing against said top portion of said associated slat, and each individual fastening member incorporating opposed recesses and a coupling portion, the coupling portion of one individual fastening member being slidably receivable within said opposed recesses of an adjacent individual fastening member.



3,272,257
FLEXIBLE DOOR HINGE SYSTEM
Angelo Dirubbo, North Chelmsford, Mass., assignor to A & D Fabricating Co., Inc., Lowell, Mass., a corporation of Massachusetts
Filed Jan. 16, 1964, Ser. No. 338,247
10 Claims. (Cl. 160—354)

1. In a swinging door of the type formed by a sheet of heavy, flexible, transparent material having its upper edge, and one side edge, supported in an inverted, L shaped rigid frame the combination of;



a hollow vertical tube of quadrangular cross section, integrally fixed to the side portion of said L shaped frame, said tube being of predetermined height and having opposite, open ends;

a pair of hinge bases, each having a socket of quadrangular cross section, and adapted to be affixed at the upper, and lower, extremity of a door jamb in coaxial alignment with the other, and

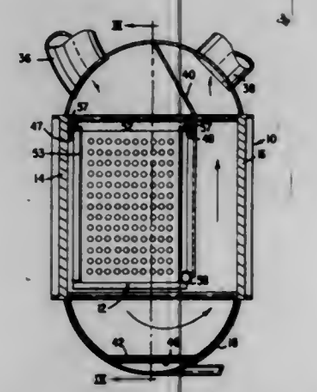
a pair of solid torsion bars of flexible resilient material, each bar having one end seated in one of said sockets and the other end seated in the adjacent open end of said tube.

3,272,258
MEANS FOR KEEPING A HIGH DEGREE OF TEMPERATURE STABILITY WITHIN A CHAMBER OF SUBSTANTIAL DIMENSIONS
Fernand Eugene Gabriel Bourquard, 13 Rue Cantin, Courbevoie, Seine, France
Filed Sept. 5, 1963, Ser. No. 306,944
Claims priority, application France, Sept. 5, 1962, 908,692, Patent 1,340,298; Aug. 3, 1963, 943,678, Patent 86,255
1 Claim. (Cl. 165—26)

A device which comprises, in combination,

a first closed gastight chamber to be maintained at a predetermined temperature higher than that of the surrounding medium,

a heat insulated closed gastight chamber surrounding said first chamber,

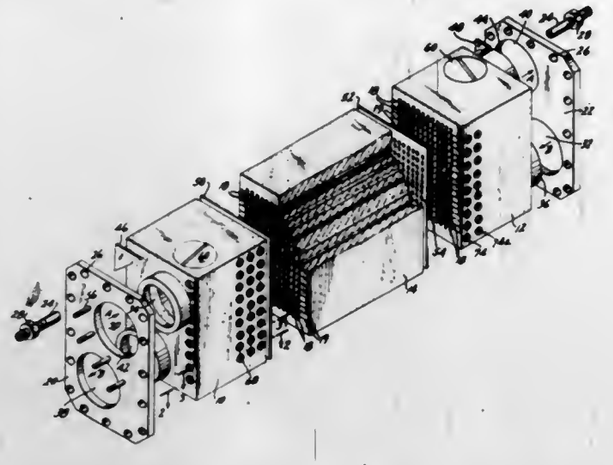


in said heat insulated chamber and outside of said first chamber a substance present both in the state of vapor and in the liquid state,

said first chamber being located in said heat insulated chamber so as to be surrounded exclusively by the vapor phase of said substance,

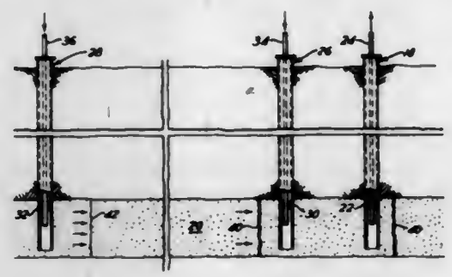
means for heating said substance in the liquid state capable of bringing both of said chambers to a temperature higher than said predetermined temperature, and

means responsive to the pressure of said vapor phase for evacuating a portion of said vapor to keep the temperature inside the second mentioned chamber at a fixed value, said last mentioned means including a condenser having its top portion in communication with the top portion of said second mentioned chamber and its bottom portion in communication with the bottom of said second mentioned chamber for the return by gravity of the liquid condensed in said condenser.



3,272,259
HEAT TRANSFER APPARATUS
James R. Shields, Pittsburgh, Pa., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Original application June 11, 1962, Ser. No. 201,394. Divided and this application Oct. 17, 1963, Ser. No. 316,956
3 Claims. (Cl. 165—158)

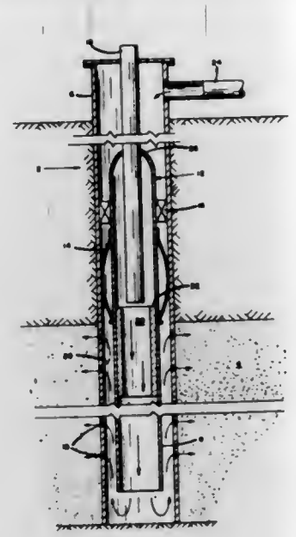
1. Heat transfer apparatus comprising a shell assembly defining an enclosure having an end opening and including opposed side members formed of relatively thick material, a base member of semi-circular configuration in cross-section depending from and connecting the lower ends of the opposed side members, means connecting one pair of ends of said side member with the adjacent edge of said base member to form an end closure, a top cover having an inlet and an outlet for said enclosure, a partition depending from the top cover but terminating short of the base to form a gas flow path from the inlet downwardly between the partition and one side to the bottom of the apparatus and upwardly between the partition and other side to the outlet; and a tube assembly comprising spaced tube sheets, a plurality of tubular members connecting said tube sheets, side members coextensive with said tubes connecting the tube assembly to the partition and one of said shell side members, reversing flow means in communication with said tubular members secured to one of said tube sheets, said tube assembly being constructed so that the end supporting said reversing flow means may be inserted into the enclosure and the tube assembly supported therein.



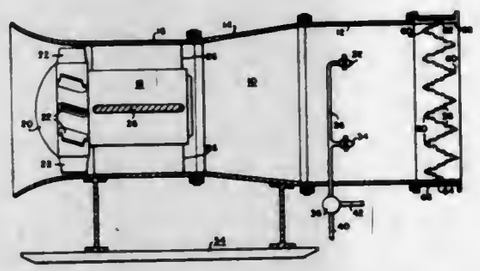
3,272,260
CORROSION RESISTANT HEAT EXCHANGER
Samuel H. S. Raub, Bay Village, and Starling F. Joachim, Cleveland, Ohio, assignors to Union Carbide Corporation, a corporation of New York
Filed Aug. 11, 1961, Ser. No. 130,817
11 Claims. (Cl. 165—164)

1. A heat exchanger for two fluids which comprises in combination two headers fabricated from monolithic blocks of impervious graphite, said headers being provided with a plurality of rows of horizontal drilled passageways all of whose axes are parallel to one another,

said headers being so adapted that each of said fluids pass through separate horizontal rows of parallel passageways.



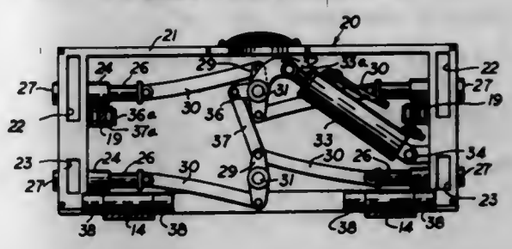
3,272,261
PROCESS FOR RECOVERY OF OIL
Richard A. Morse, Oakmont, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware
Filed Dec. 13, 1963, Ser. No. 330,497
11 Claims. (Cl. 166—11)



3. In a process for increasing the production of oil from an oil-bearing formation penetrated by a production well and a heater well spaced from the production well, the improvement comprising drilling the heater well within the drainage area of the production well at a distance of from about 50 to about 100 feet, injecting heat into the formation at the heater well at a rate sufficient to raise the bottom hole temperature in the production well to at least 200° F. within two weeks after commencing injection of heat at the heater well to form a zone having a temperature greater than 200° F. around the production well, thereafter reducing the rate of injecting heat into the formation at the heater well, producing oil from the production well, and continuing the injection of heat into the formation at the heater well while producing oil at the production well to maintain the temperature in the production well in the range of 200° to 600° F.

3,272,262
IGNITION OF THICK PAY FORMATIONS
Karol L. Hujsak, Tulsa, Okla., assignor to Pan American Petroleum Corporation, Tulsa, Okla., a corporation of Delaware
Filed Jan. 23, 1964, Ser. No. 339,728
6 Claims. (Cl. 166—38)

6. In a method for igniting a thick, carbonaceous deposit penetrated by a cased well having perforations opposite and throughout the thickness of said deposit, the improvement which comprises isolating a first zone opposite said deposit in said well extending substantially the entire height of said deposit, conducting separate streams of fuel and air in combustible proportions into a second zone within said first zone to form a combustible mixture, igniting said mixture in said second zone and continuing the injection of said fuel and air in combustible proportions into said second zone to produce hot combustion products, conducting said products from said second zone in a downwardly direction through a confined path and out of direct contact with said deposit and said first zone to a position in said well substantially adjacent and above the lower boundary of said first zone, withdrawing said products from said confined path at said position into said first zone, and forcing said products into said deposit opposite said first zone.



3,272,263
METHOD OF FIGHTING MINE FIRES
Will B. Jamison, Wyckoff, N.J., assignor, by mesne assignments, to Specialties Development Corporation, Belleville, N.J., a corporation of New Jersey
Original application Mar. 7, 1960, Ser. No. 13,103. Divided and this application Sept. 7, 1965, Ser. No. 485,382
2 Claims. (Cl. 169—15)

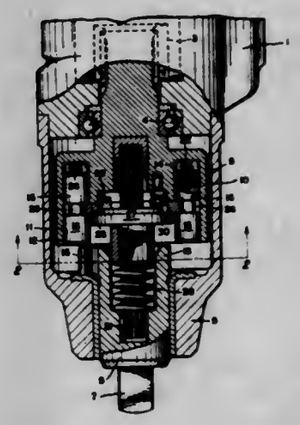
2. In the method for fighting fires in a mine having a forced-air ventilation system and a plurality of parallel mine roadways leading to a fire zone and through which ventilation currents may flow, the steps of generating air currents in at least one of said parallel roadways, utilizing said generated air currents to produce a fire-fighting foam plug which will travel down said one roadway to the fire zone while permitting the ventilation currents to travel through the other parallel roadways to the fire zone, and controlling said ventilation currents and the currents generated in said one roadway independently of each other.

3,272,264
EARTH-MOVING EQUIPMENT
Henry S. Antolini, 203 Scott Drive, Santa Maria, Calif.
Filed Mar. 31, 1964, Ser. No. 356,241
3 Claims. (Cl. 172—273)

1. A latching mechanism for removably securing to a tractor or other prime mover various tools having apertured tongues projecting therefrom comprising:

(a) A framework adapted to be secured to the tractor and having a plurality of openings to receive the tongues of the tools;

(b) bolt receivers secured to the framework adjacent to a plurality of said openings;



(c) bolts slidably disposed in each receiver;

(d) power means;

(e) mechanical connections between the bolts and the power means for sliding said bolts into and out of said apertures to respectively engage the apertures of tongues and to release the tongues, and

(f) mechanical means for holding the bolts in engagement in the apertures to lock a tool to the framework.

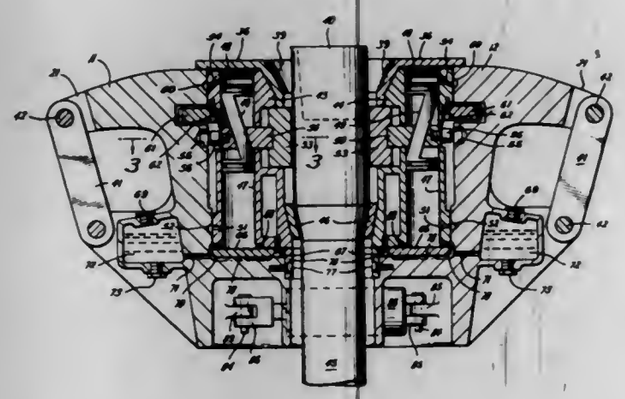
3,272,265
ROTARY IMPACT TOOL
Charles L. Schrader and Lee W. Ramstrom, Sayre, Pa., assignors to Ingersoll-Rand Company, New York, N.Y., a corporation of New Jersey
Filed Mar. 26, 1964, Ser. No. 354,851
10 Claims. (Cl. 173—93)

3. A rotary impact mechanism comprising:

(a) a frame;

(b) an anvil rotatably mounted on said frame;

(c) a hammer rotatably mounted on said frame including means movable relative to said anvil between an impact position wherein it delivers a rotary impact to said anvil and a non-impact position wherein it can rotate free of the anvil;



(d) means biasing said movable means to said impact position;

(e) a pair of cam elements interconnected between said anvil and hammer, one of said cam elements being mounted on said anvil and the other being mounted on said hammer, said cam elements being operative in their normal positions on their respective mounting members to engage and hold said

movable means in said non-impact position wherein said movable means does not impact said anvil; and

(f) said cam members being arranged to release said movable means as it rotatively approaches said anvil so that said biasing means moves said movable means to said impact position.

3,272,266
APPLICATION FOR ROTATABLE POWER ELEVATOR
Thomas A. Kennard, 1506 Conrad Sauer, Houston, Tex.
Filed May 6, 1964, Ser. No. 365,455
15 Claims. (Cl. 173—164)

1. A rotatable power elevator for raising and lowering a section of pipe and rotating said section during make-up and break-out operations, comprising:

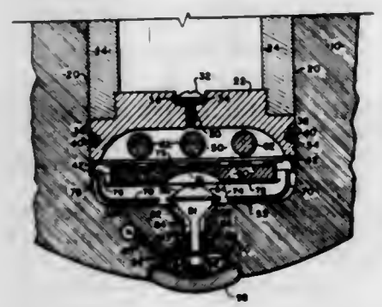
an outer housing having at least two portions which are connected together for opening and closing and which in the closed position define a recess therebetween for receiving said section of pipe,

a rotatable inner body having at least two segments, each of which is supported by one of said portions of said outer housing when said housing is in the open position, and which segments define a recess therebetween for supporting therein said section of pipe when said housing is in the closed position,

pipe engaging means mounted in said inner body for gripping said section of pipe,

means for raising and lowering said outer housing while said section of pipe is being supported by said inner body,

means for rotating said inner body while said section of pipe is being supported by said inner body.



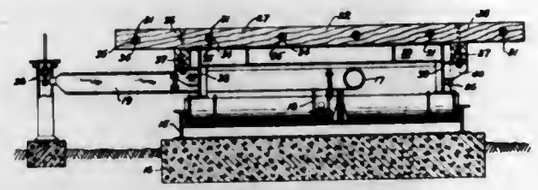
3,272,267
WALKING STICK FOR FASTENING TOOL
Arthur Langas, Chicago, Ill., assignor to Signode Corporation, a corporation of Delaware
Filed Oct. 21, 1963, Ser. No. 317,701
2 Claims. (Cl. 173—170)

1. A walking stick for a fastening tool whereby the valve controlling the operation of the tool can be operated from a remote position, said walking stick including a first tube secured to the tool, a second tube slidably mounted within said first tube, bushings spacing said second tube from the wall thereof to define an annular chamber, said second tube defining a pair of aligned elongated slots, first pin means extending through aligned openings defined by said first tube and said elongated slots for limiting the longitudinal movement of the second tube relative to said first tube, second pin means longitudinally spaced from said first pin means and extending through aligned openings in said second tube, spring means disposed in the annular chamber and in engagement with said second pin means to bias said second tube out of engagement with said valve, bumper means adjustably mounted in the end of said second tube and adapted to engage said valve, and a transversely

extending handle secured to the upper portion of said second tube whereby the walking stick can be gripped and operated by an operator standing in an upright position.

3,272,268
SIDEWALL SAMPLING APPARATUS
Alfred J. Tricon and Forrest V. Porter, Houston, Tex., assignors to Dresser Industries, Inc., Dallas, Tex., a corporation of Delaware
Filed May 25, 1965, Ser. No. 461,598
12 Claims. (Cl. 175—4)

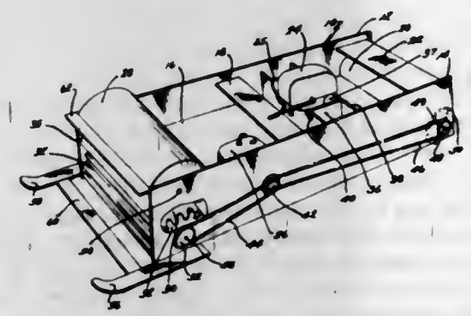
10. Apparatus for obtaining a sample of earth substances from a subsurface earth formation of predetermined consolidation which is traversed by a borehole, said apparatus comprising



an elongated body having at least one lateral aperture extending partially into said body in a manner to form a gun bore and primary firing chamber,

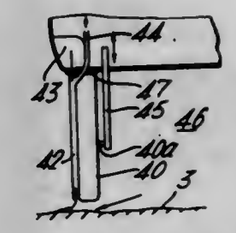
a hollow projectile having an open cutting end and a closed end with an inwardly hollowed outer surface, said projectile being slidably disposed in said bore with said closed end confronting said primary firing chamber in a manner such that said closed end of said projectile forms a secondary firing chamber in said gun,

linking means coupling said projectile to said gun, and



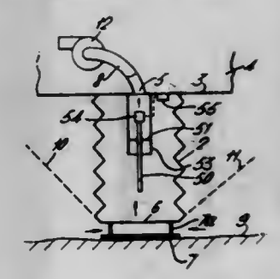
a propelling charge of selectively variable volume disposed in said primary and secondary firing chambers for discharging said projectile from said bore and into said earth formation a distance at least great enough to substantially fill said projectile with earth substances from said formation but not great enough to sever said linking means.

3,272,269
VEHICLE-WEIGHING SCALE WITH DECK UNIT WHICH MAY BE DISMANTLED FOR TRANSPORTATION
Leslie R. Murphy, Sacramento, Calif., assignor to L. R. Murphy Scale Company, Sacramento, Calif., a corporation of California
Filed Oct. 20, 1965, Ser. No. 505,583
8 Claims. (Cl. 177—126)



1. In a highway-transportable scale having a base frame supported weighbridge of permissible width for road transportation and much longer than said width, and a separable deck for said weighbridge the length of said weighbridge and of a required width greater than the permissible width for highway travel so that it overhangs the deck on each side thereof, the improvement wherein said deck comprises a plurality of like side-by-side lengthwise-connected units each of said required width and each having its length shorter than said permissible width, each said deck unit being further divided into individual deck slabs extending across said unit with the length of each said slab being the width of said deck and being much narrower than said unit, said units being stackable one upon the other and secured in end-to-end relation on said weighbridge for road transportation with the scale then being of said permissible width.

3,272,270
AIR CUSHION VEHICLE
Geoffrey F. Hughes, 1109 Lakeside SE., Grand Rapids, Mich.
Filed Feb. 28, 1964, Ser. No. 348,092
3 Claims. (Cl. 180—7)



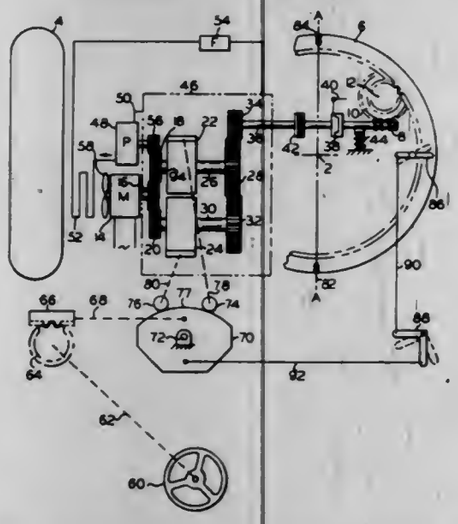
1. An air cushion vehicle for travel over a surface, comprising: a vehicle body having a front end and a rear end; power motor means supported by said body; said body being configurated to form an air cushion chamber beneath said body over a major portion thereof from front to rear; a pair of upper and lower intermeshed elongated gear wheels in said front end communicating with said chamber, and enclosing the front end of said chamber; the periphery of said lower elongated gear wheel being exposed and positioned to form contacting and sealing means for the surface over which the vehicle travels; shroud means over the upper peripheral portion of said upper elongated gear wheel; drive connection means between said motor means and said gear wheels to operate said wheels in opposite directions to thereby create an air cushion in said chamber due to the pumping action of said wheels, and to cause said lower wheel to form propulsion means as well as sealing means on the surface over which the vehicle travels; and means generally enclosing the rear of said chamber to retain a positive pressure air cushion as a buoyant force in said chamber.

3,272,271
AIR CUSHION VEHICLES HAVING MOVABLE CUSHION-CONTAINING WALLS
Christopher Sydney Cockerell, Bassett, Southampton, England, assignor to Hovercraft Development Limited, London, England, a British company
Filed June 16, 1964, Ser. No. 375,536
Claims priority, application Great Britain, June 21, 1963, 24,820/63
19 Claims. (Cl. 180—7)

1. A vehicle for travelling over a surface and which, in operation, is supported, at least in part, above the surface by a cushion of pressurised gas formed beneath the vehicle, the cushion being contained for at least part of its periphery by a wall movably attached to the vehicle body and wherein, in providing support for the vehicle, gas streams between the wall and said surface, comprising means for sensing variations in the flow characteristics of the gas stream resulting from a variation in the clearance between the lower edge of said wall and said surface, and means operatively controlled by said sensing means for moving the wall vertically in response to such variation in flow characteristics.

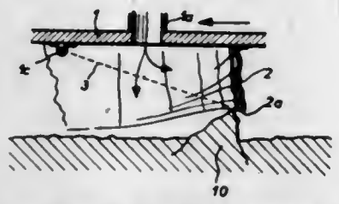
3,272,272
AIR CUSHION VEHICLES HAVING VERTICAL COLLAPSIBLE WALLS
Kenneth Hall, Hythe, Denys Stanley Bliss, Ashurst, and Michael Charity, Langley, England, assignors to Hovercraft Development Limited, London, England, a British company
Filed June 16, 1964, Ser. No. 375,493
Claims priority, application Great Britain, June 21, 1963, 24,821/63
16 Claims. (Cl. 180—7)

1. A vehicle which, in operation, is supported above a surface, at least in part, by a cushion of pressurised gas formed and contained beneath the vehicle, comprising a hollow wall for downward projection beneath the vehicle body so as to contain, at least in part, the cushion, the wall being collapsible in an upward direction, means for applying a suction to the interior of the wall to reduce the pressure therein below that of the space surrounding said wall and thereby promote collapse of said wall, inlet means for supplying fluid to the interior of the wall to relieve said suction and thereby avert said collapse, and inlet control means responsive to variations in the distance between the bottom of the wall and the surface below the



vehicle for reducing the supply of fluid by said inlet means and thereby diminishing relief of the suction as said distance decreases.

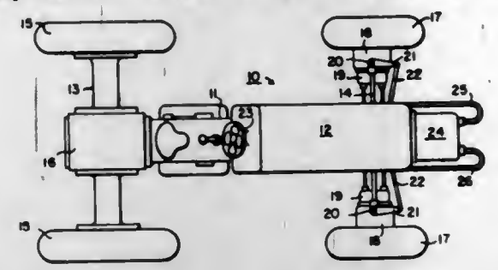
3,272,273
GROUND EFFECT VEHICLE AIR FLOW DESIGN
Richard William Lowrie, Wayne, Pa.
(1730 Robin Hood Lane, Clearwater, Fla.)
Filed Oct. 4, 1961, Ser. No. 142,939
1 Claim. (Cl. 180—7)



In a ground effect vehicle of the annular jet type, means for entraining and enclosing air under pressure beneath said vehicle, comprising a peripheral annular air supply port and an annular air exhaust opening in the base of said vehicle inboard of and adjacent said supply port, said opening having a curved entrance on the inboard side, and said opening forming one end of a duct leading the exhaust air through the vehicle structure for recirculation through said supply port, which supply port and opening dimensions together with the supply air pressure and volume cause the air to flow inboard from said supply port, to or near the ground or water surface, thence curving upwards into said vehicle with little or no loss of air from said vehicle along the surface of the ground or water, and where said vehicle includes an annular flexible semipermeable bag, open at the top, attached to said vehicle with means for extending and positioning said bag beneath both said supply port and said return air opening so as to enclose and deflect the air stream inside the bag while maintaining base pressure, and with means for retracting said bag and stowing same to permit normal motion of said vehicle.

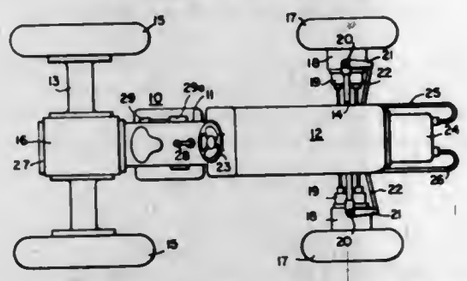
3,272,274
VEHICLE
Wayne H. McGlade, Peoria, Ill., assignor to LeTourneau-Westinghouse Company, Peoria, Ill., a corporation of Illinois
Filed Aug. 27, 1964, Ser. No. 392,446
11 Claims. (Cl. 180—79.4)

1. Steering mechanism for a vehicle having dirigibly mounted ground engaging means, comprising:
driven means having a connection to change the orientation of the ground engaging means relative to a fixed axis of the vehicle;
a motor;
first and secondary planetary power trains each having a sun element, a planet element, and a ring element, one of the elements of each train having a power input connection, another having a power output connection, and the remaining element connected with a brake actuable to impede rotation of its connected element;
means drivingly connecting the motor and the input connections of the two power trains;
means connecting the driven means with the output connections of the two power trains;
an operator-operable steering control device; and
means connecting said device for selective actuation of either of the brakes to effect steering.



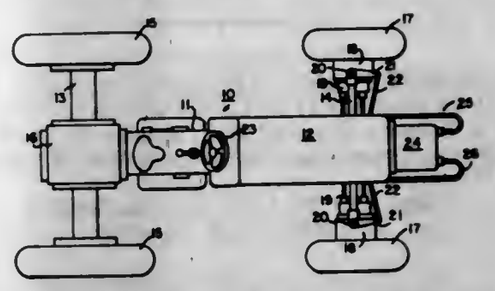
3,272,275
MOVABLE PLATFORM RESTING ON AN AIR CUSHION ENCLOSED INSIDE AT LEAST ONE YIELDING PREFERABLY CIRCULAR SKIRT
Marc Faure, Saint-Maur-des-Fosses, France, assignor to Societe Bertin & Cie, Paris, France, a company of France
Filed Apr. 27, 1964, Ser. No. 362,608
Claims priority, application France, Apr. 29, 1963, 933,105
9 Claims. (Cl. 180—7)

1. In a plenum chamber type ground-effect machine designed to move along rough ground having protruding obstacles, comprising a support frame, a skirt made of supple fluidtight material tensionable by internal overpressure and having a wide-open free end, said skirt depending from said support frame with said free end remote therefrom, so that said skirt defines the lateral boundary of the plenum chamber of the ground effect machine, means on said support frame for delivering pressurized fluid inside said skirt thereby tensioning the same, the improvement having means for detecting an obstacle projecting through said free end into said plenum chamber comprising a sheet-like structure extending inside said skirt across a portion of said plenum chamber and having a widely exposed undersurface to be engaged by such obstacle and upwardly deflected thereby, said sheet-like structure being fluid permeable to an extent as to interpose no substantial resistance to the passage of a fluid therethrough and thereby enabling no modified functioning of the aerodynamic operation of said skirt despite said sheet-like structure being positioned in the plenum chamber and interposed in the flow path, said sheet-like structure being mechanically connected with at least a portion of the free end of said skirt so that said skirt is raised when said sheet-like structure engages an obstacle protruding into said skirt through said free end.



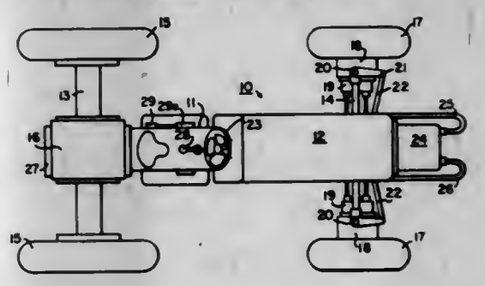
3,272,276
FLUID POWER SYNCHRONIZED DRIVES FOR VEHICLES
Tadeusz Budzich, 3344 Colwyn Road, Cleveland, Ohio
Filed Apr. 17, 1964, Ser. No. 360,534
10 Claims. (Cl. 180—44)

1. In a self-propelled vehicle having a frame, an engine and driving wheels mounted on said frame, driving means interposed between said engine and said driving wheels, at least one steering wheel pivotally mounted on said frame; the combination therewith of a fluid power transmission and control system disposed to drive each of said steering wheels comprising, fluid motor means mounted on said steering wheels and drivingly engaged therewith, fluid responsive clutch means interposed between said fluid motor means and said steering wheels, a variable flow pump having high and low pressure ports connected to said motor means and arranged to drive said fluid motor means, pressure responsive control means to vary the flow of said pump to maintain a relatively



constant system pressure, unloading means to selectively unload said pressure responsive control means and bring said pump into condition of minimum flow and pressure, a source of control pressure disposed to operate said unloading means and said clutch means, and fluid pressure transmitting means functionally interconnecting said source of control pressure and said unloading means, whereby activation of said unloading means will bring said variable flow pump into unloaded minimum power loss condition.

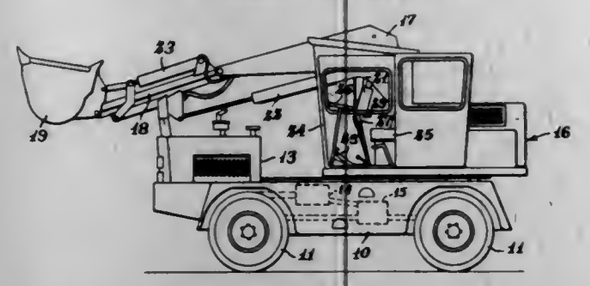
3,272,277
SYNCHRONIZATION OF FLUID POWER DRIVES
Tadeusz Budzich, 3344 Colwyn Road, Cleveland, Ohio
Filed Apr. 20, 1964, Ser. No. 360,905
12 Claims. (Cl. 180—44)



1. In a self-propelled vehicle having a frame, an engine and driving wheels mounted on said frame, transmission means interposed between said driving wheels and said engine, shift means arranged to change the driving ratio of said transmission means, mechanical clutch means interposed between said transmission means and said engine, said mechanical clutch means having mechanical activating means to selectively disconnect said engine from said transmission means, at least one steering wheel pivotally mounted on said frame, the combination therewith of a fluid power transmission and control system disposed to drive said steering wheels comprising, fluid motor means mounted on said steering wheels and drivingly engaged therewith, a variable flow pump disposed to drive said fluid motor means, pressure responsive control means to vary the flow of said pump to maintain a relatively constant system pressure, unloading means disposed to selectively unload said pressure responsive control means and bring said pump into condition of minimum flow and pressure, means to actuate said unloading means, control means interposed between and functionally interconnecting said means to actuate said unloading means and said mechanical clutch actuating means and responsive to selective positions of said mechanical clutch actuating means, whereby selective positions of said mechanical clutch actuating means will unload said fluid power transmission and control system.

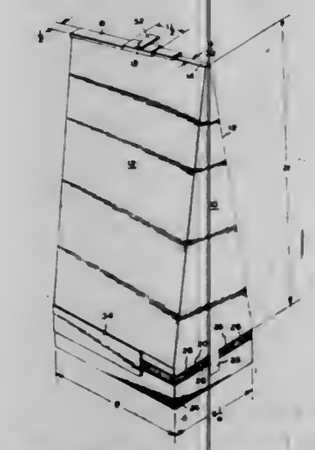
3,272,278
RESPONSE CONTROLS FOR FLUID DRIVES
Tadeusz Budzich, 3344 Colwyn Road, Cleveland, Ohio
Filed June 8, 1964, Ser. No. 373,188
8 Claims. (Cl. 180—44)

1. In a self-propelled vehicle having a frame with driving wheels connected thereto, an engine, a mechanical transmission interposed between said engine and said driving wheels and at least one steering wheel pivotally mounted in respect to said frame; the combination therewith of a fluid power transmission and control comprising, a fluid motor drivingly connected to each of said steering wheels, a variable flow pump for driving each of said fluid motors, said variable flow pump having a flow changing mechanism, means urging said flow changing mechanism toward a position of maximum pump flow, signal responsive actuating means opposing said last named means and urging said flow changing mechanism toward a position of minimum pump flow, a source of control pressure, a low pressure zone, means for selectively connecting said signal responsive actuating means with said source of control pressure and said low pressure zone to maintain a relatively constant pressure fluid supply from said variable flow pump to said fluid motor, and unidirectional fluid flow-restricting means interposed between said signal responsive actuating means and said low pressure zone for restricting fluid flow from said signal responsive actuating means to said low pressure zone, whereby said flow changing mechanism will be slow acting in the direction of increased pump flow.



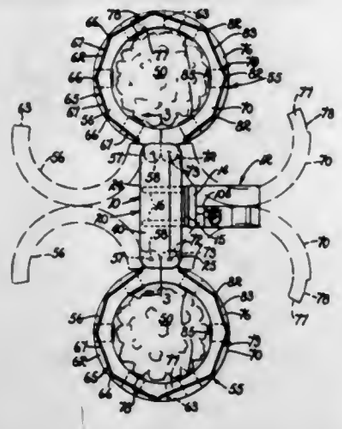
3,272,279
FLUID PRESSURE OPERATED DRIVE AND CLUTCH SYSTEMS
Tadeusz Budzich, 3344 Colwyn Road, Cleveland, Ohio
Filed June 8, 1964, Ser. No. 373,426
12 Claims. (Cl. 180—44)

1. In a self-propelled vehicle having a frame, engine, and driving wheels mounted on said frame, driving means interposed between said engine and said driving wheels, at least one steering wheel pivotally mounted on said frame, the combination therewith of a fluid power transmission and control system drivingly connected to each of said steering wheels comprising, a fluid motor mounted on each of said steering wheels and drivingly engaged therewith, a variable flow pump connected to supply pressure fluid to each of said motors, pressure responsive control means to vary the flow of said pressure fluid from said pump to maintain relatively constant system pressure, system-pressure sensitive clutch means interposed between each of said fluid motors and said steering



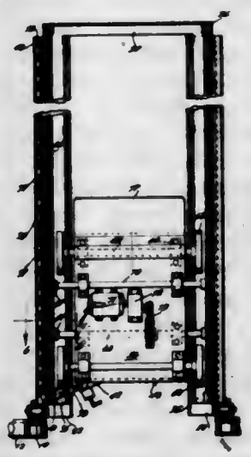
wheels, said clutch means having force generating means disposed to supply an actuating force proportional to the system pressure to the clutch means, and duct means to supply fluid pressure from said variable flow pump to said system pressure sensitive clutch means.

3,272,280
TRANSMISSION AND STEERING CONTROL MECHANISM FOR MATERIAL HANDLING VEHICLE
John R. Schuetz, Wausau, Wis., assignor to Drott Manufacturing Corporation, Milwaukee, Wis., a corporation of Wisconsin
Filed May 25, 1964, Ser. No. 369,855
3 Claims. (Cl. 180—77)



1. In combination with a vehicle having a lower frame, a reversible transmission on the lower frame, steerable wheels on the lower frame and an upper frame mounted on the lower frame for pivoting about a vertical axis, a control system comprising first power means on the lower frame connected to the transmission to reverse it, a manually operable control for the power means mounted on the upper frame, means including a first reversing device connecting the control to the power means, second power means mounted on the lower frame and connected to the steerable wheels to turn them, a second manually operable control for the second power means mounted on the upper frame, means including a second reversing device connecting the second control to the second power means, and means operatively connecting the first and second reversing devices for simultaneous operation.

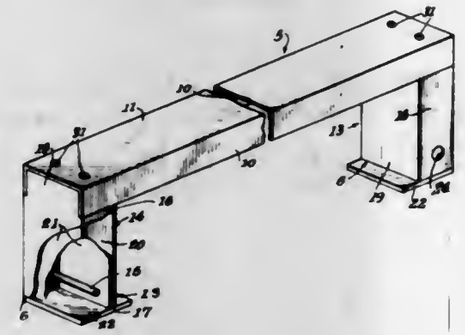
3,272,281
TRANSDUCER
Harvey M. Rutter, 32 Grubb Road, Malvern, Pa.
Filed Dec. 4, 1964, Ser. No. 415,889
19 Claims. (Cl. 181—31)



1. A device for converting energy impulses into audible sound comprising: a sound radiating element of substantially uniform length and width of varying thickness having one end substantially restrained and the opposite end substantially free and means for exciting the free end of said element in response to said energy impulses.

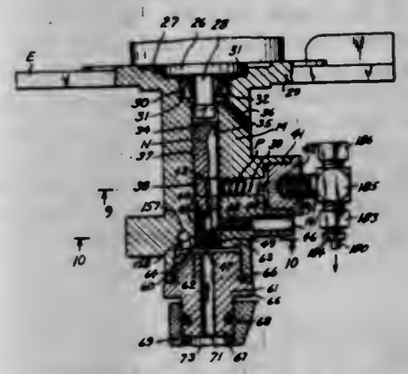
3,272,282
SCAFFOLD
Shelby W. Sanders, Reedley, Calif., assignor of five percent to Wesley A. Lee, Caruthers, Calif., five percent to Lillian S. Bonner, Selma, Calif., five percent to Bernice B. Bonner, Reedley, Calif., and five percent to Preston J. Sanders, Sunnyvale, Calif.
Filed Aug. 3, 1964, Ser. No. 387,157
6 Claims. (Cl. 182—63)

2. In combination with a self-propelled vehicle having an elevationally adjustable load support mechanism, a scaffold comprising a substantially rigid mounting adapted to be mounted on said load support mechanism of the vehicle for earth traversing movement and elevational positioning of the scaffold relative to work objects, at least one pair of worker support platforms having substantially straight inner end portions pivotally connected to said mounting in side-by-side elevationally spaced substantially parallel relation and arcuate outer portions movable between retracted positions with the inner ends substantially aligned and work positions with the outer portions overlapped to form a continuous circular platform about the work object, and link means pivotally interconnecting said inner ends of the platforms for simultaneous movement between said retracted and work positions.



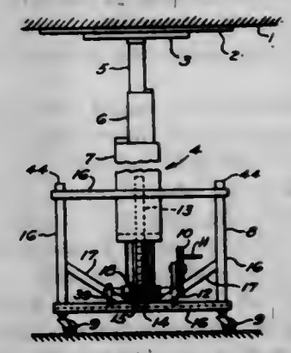
3,272,283
SAFETY CLIMBER
Denzol E. Bullard, 1406 Childs St., and Hugh W. King, P.O. Box 787, both of Corinth, Miss.
Filed Dec. 15, 1964, Ser. No. 418,422
5 Claims. (Cl. 182—141)

1. A ladder device comprising an outer frame, an inner frame slidably engaged with said outer frame for movement parallel thereto, means to support said outer frame in an upstanding position, said inner frame being provided with parallel track members, a carriage member engaged



with said track members for movement therealong, means on said carriage member to support an operator, a pair of spaced wheel members rotatably mounted on said carriage member, an elongated flexible member connected at one end to the top portion of said inner frame and at the other end to the lower portion of the inner frame and engaging under and around one wheel member and over and around the other wheel member, drive means on the carriage member operatively connected to one of the wheel members for raising and lowering the carriage member, and means connecting the carriage member to the outer frame and supportingly-engaged with the inner frame for moving said inner frame upwardly relative to said outer frame responsive to and simultaneously with the upward movement of said carriage member in said inner frame.

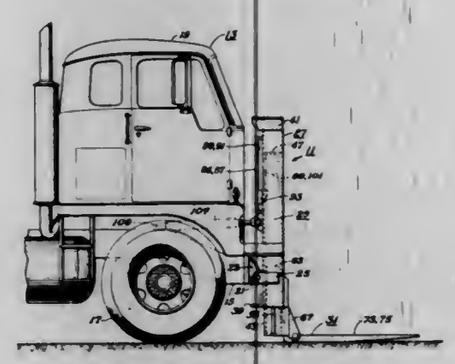
3,272,284
RUNWAY JACK
Angela E. Lincoln, P.O. Box 5400, Metro Station, Los Angeles, Calif.
Filed Oct. 5, 1964, Ser. No. 401,545
2 Claims. (Cl. 182—224)



1. A runway jack comprising:
(a) an elongated metal channel member having two side flanges connected along their upper longitudinal edges by a web substantially wider than the height of said flanges,
(b) said web, spaced inwardly from each end, being provided with two transversely spaced holes that are equally spaced from said upper longitudinal edges of the web,
(c) two tubular metal leg members, of rectangular cross-sectional form, fitted and permanently affixed to said channel member, one at each end of said member, the opposite wider walls of said leg member having upper extensions that fit between the channel flanges and are in bearing engagement with the under face of the channel web, and the opposed narrower walls of the rectangular leg members having their upper edges in bearing engagement with the lower edges of the channel flanges, said narrower walls being wider than the spacing of the mentioned holes from the ends of the channel member, said holes thereby opening into the interiors of said leg members,
(d) a rectangular metal leg member adjustably telescopically fitted into said interior of each affixed leg member, the rectangular size of the latter leg members providing a loose sliding fit of the respective pairs of leg members, the affixed and adjustable leg members being approximately the same length,
(e) a metal plate affixed to the lower end of each telescopic leg member to close said end, and
(f) means to separably fasten the adjusted position of the pairs of leg members to space runway boards from a support surface for the jack,
(g) the mentioned holes in the web of the channel being adapted to receive downwardly projecting bolts that are provided adjacent the ends of said runway boards when the board ends rest upon the channel web, and are disposed on transverse spacing that is in register with the longitudinal spacing of the pairs of transversely spaced holes.

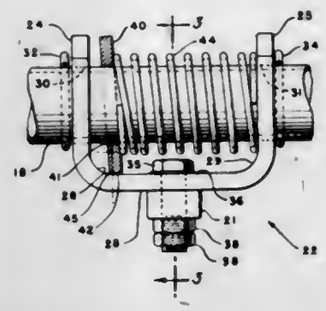
3,272,285
PUMP UNIT FOR A CENTRAL LUBRICATING INSTALLATION
Thomas R. Thomas, New York, N.Y., assignor to Auto Research Corporation, Boonton, N.J., a corporation of Delaware
Filed June 11, 1963, Ser. No. 287,027
15 Claims. (Cl. 184—27)

1. In a centralized lubricating installation for distributing lubricant to spaced bearings in and about a mechanism, a reservoir, a central pump detachably mounted on said reservoir comprising a detachable cover having mounting means, a drive arrangement carried on the top side of the cover, a pressure and volume adjustment and an outlet connection mounted on the cover, a pump body on the other side of the cover, a central shaft extending across the top of the cover and through the body and driven by said arrangement, said shaft having an eccentric recessed portion forming a pump chamber, a spring pressed follower vane riding in said recess located transversely to the shaft, inlet and outlet bore systems in the pump body having opposite inlet and outlet ports at the eccentric portion and tubing connections to said chamber and to said recess on the side of the vane away from said shaft, means to regulate the pressure and volume discharge of said pump connected to said systems and also from said outlet system to the outlet connection.



3,272,286
PORTABLE ELEVATING MECHANISM
Philip A. Leduc, Carlisle Ave., Turners Falls, Mass.
Filed Aug. 24, 1964, Ser. No. 391,377
6 Claims. (Cl. 187—2)

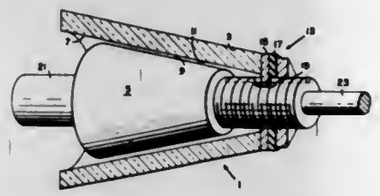
1. An elevating device having a portable frame, an elevating mechanism within said frame, said elevating mechanism consisting of a plurality of telescopic mem-



bers of various size cross-sections, one nested within the other, the largest being at the bottom, and the smallest being at the top, a threaded shaft means connected to the bottom telescopic member, a transmission system for turning said threaded shaft means, and a safety device for maintaining and securing said elevating mechanism at pre-determined fixed heights, a separate pulley system for operating each of said other telescopic members and operating synchronously with the lowering or raising of the bottom member, said pulley system for operating the next largest member having a sheave mounted in a floor plate affixed to the frame, a sheave mounted in the lowest portion of the next largest member, a sheave mounted at the top of and inside of the largest member in alignment with the other mentioned sheaves, a cable attached to the bottom of the largest member, said cable circumscribing the sheave in the base plate, said cable rising to the sheave at the top of the largest member, said cable circumscribing the last-mentioned sheave, said cable dropping to the sheave attached to the bottom of the next largest member, said cable circumscribing said sheave and rising to the top of the largest member where it is secured, whereby when said threaded shaft means rotates, said sheave attached to the bottom of said next largest telescopic member rises to proximate contact with the sheave mounted at the top of the largest telscopic member.

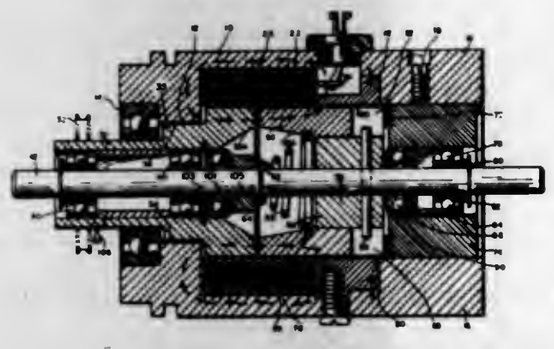
3,272,287
MATERIALS HANDLING APPARATUS
Joe A. Easton, Fort Worth, Tex., assignor to Jimmy D. Worthey, James B. Huff, Harry N. Ward, and Harry N. Ward, Jr.
Filed Aug. 18, 1964, Ser. No. 390,357
4 Claims. (Cl. 187—9)

1. In combination with a highway travel type vehicle, a materials handling elevator apparatus comprising:
(a) a frame structure including spaced apart parallel upright members coupled to the front end of said vehicle, said upright members being disposed with their upper extremities below the lower edge of the frontward field of vision of the truck operator and with their lower extremities having at least road travel clearance above the ground supporting said vehicle;
(b) a mast structure of length not exceeding that of said frame structure and telescoping said frame structure and movable longitudinally thereof, said mast structure including spaced apart parallel rails disposed adjacent the respective upright members of said frame structure and a cross-head member connecting the upper ends of said rails;
(c) a hydraulic lift device including a plurality of relatively extensible and retractile elements;
(d) means mounting the lowermost said element adjacent and fixed relative to said frame structure;
(e) means fixing the uppermost one of said elements to said crosshead member;
(f) a load receiving structure coupled to said mast structure and movable longitudinally thereof;
(g) an elongate bar member disposed adjacent said frame structure and movable from a first position to a second position;
(h) flexible linkage means anchored to said load receiving structure and to said elongate bar member;
(i) rotatable sheave means carried by said crosshead over which sheave means said flexible linkage means extends;
(j) means extending a first element of said lift device and extending simultaneously said mast structure and said load receiving structure equally a first predetermined distance along said frame structure while said elongate bar members moves from said first to said second position;
(k) means engaging said elongate bar and maintaining the same at said second position; and
(l) means extending at least one other element of said lift device and extending further said mast structure a second predetermined distance along said frame structure while said sheave means urges said flexible linkage means to move said load receiving structure relative to said mast structure.



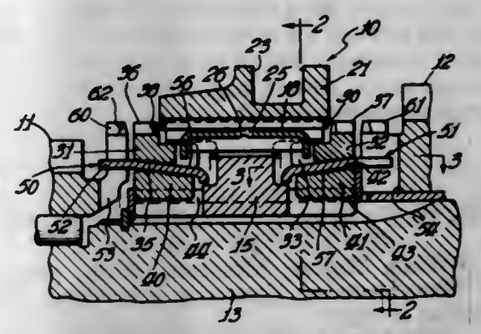
3,272,288
FRICTION BRAKE
Robert G. Young, Bird in Hand, Pa., assignor to Sperry Rand Corporation, New Holland, Pa., a corporation of Delaware
Filed Sept. 18, 1964, Ser. No. 397,498
2 Claims. (Cl. 188—67)

1. In combination with a shaft rotatable about its own axis for disposition in various angular positions, means to support said shaft and frictionally hold said shaft in any angular position to which it is rotated, said supporting and holding means comprising a fixedly mounted generally U-shaped support bracket having first and second generally parallel planar leg portions interconnected by a generally planar bight portion, said planar bight portion extending perpendicular to said planar parallel leg portions, said leg portions having coaxial apertures therethrough through which said shaft extends in rotatably supported relation with the axis of said shaft parallel to said planar bight portion of said support bracket, a disc member disposed between said first and second bracket leg portions and having an aperture therethrough of larger diameter than said shaft, said shaft extending through said disc member aperture, a coil spring encircling said shaft and having ends respectively abutting said disc member and one of said bracket leg portions thereby urging said disc member along the axis of said shaft toward the other of said bracket leg portions, said disc member having a planar edge bearing on said planar bight portion of said support bracket in a plane perpendicular to said shaft axis thereby locking said disc member against rotation relative to said bracket about the axis of said shaft, means on said support bracket engaging said disc member on the axial side thereof toward said other of said bracket leg portions and



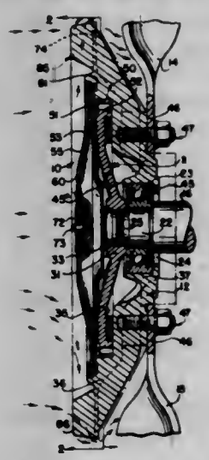
on only one transaxial side of said shaft whereby said disc member is canted relative to said shaft by the combined action of said spring and said last named means to frictionally engage said shaft and resist rotation of the shaft about its own axis, and stop means carried by said shaft and engaging said leg portions of said bracket to positively prevent relative movement between said shaft and said bracket in the axial direction of said shaft.

3,272,289
ROTARY DAMPING DEVICE USING LAPPED FRUSTO-CONICAL SURFACES
Paul V. Vermont, Santa Monica, and Paul J. Cueni, Los Angeles, Calif., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Army
Filed Nov. 5, 1964, Ser. No. 409,337
1 Claim. (Cl. 188—90)



A rotary damping device including: inner and outer elongated members made of glass and having lapped frusto-conical mating surfaces; said frusto-conical surfaces defining therebetween an effective gap of approximately .0006 inch; viscous lubricating means filling said gap; and inner member having a half-cone aperture angle of approximately 3.58°; and means securing said inner and outer members together for rotary movement relative to each other.

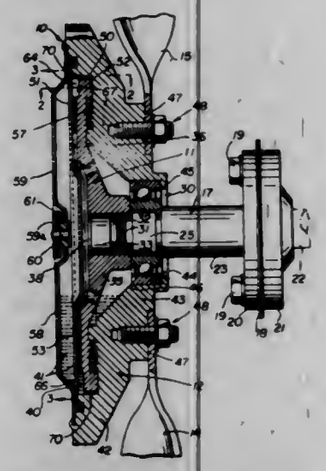
3,272,290
ELECTROMAGNETIC DEVICE
Louis H. Goddard, Dayton, Ohio, assignor to Globe Industries, Inc., Dayton, Ohio, a corporation of Ohio
Filed Oct. 31, 1957, Ser. No. 693,742
24 Claims. (Cl. 192—18)



1. An electromagnetic clutch assembly including magnetic circuit means comprising a coil adapted to carry current therethrough, a driving clutch member and a driven clutch member magnetically linked with said coil so that the clutching faces of said members are in the flux path of the coil, a driven shaft fixed against axial movement, a bushing mounted on said shaft, said driving and driven clutch members having at least a portion of each thereof of magnetic material, said driven clutch member being in the form of a sleeve mounted on said bushing and having a low moment of inertia consistent with obtaining a high relative flux path, and thereby a high torque, and being coupled to said driven shaft for rotational movement therewith but being free for translational movement with respect thereto.

3,272,291
SYNCHRONIZER
George E. Flinn, Muncie, Ind., assignor to Borg-Warner Corporation, a corporation of Illinois
Filed Aug. 3, 1964, Ser. No. 387,065
6 Claims. (Cl. 192—53)

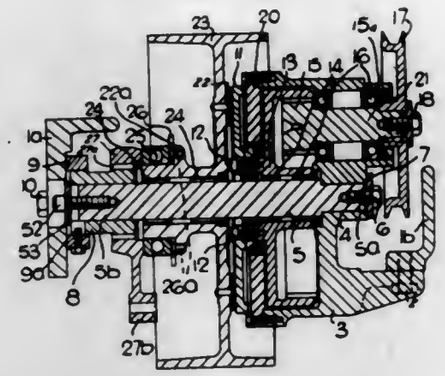
1. In a transmission synchronizer, a torque transmitting member, a rotatable part adjacent said torque transmitting member, a first synchronizer element drivingly connected to said torque transmitting member and shiftable axially for establishing a frictional driving connection between said member and said rotatable part to be synchronized therewith, a second synchronizer element drivingly connected to said member, clutch means encircling said member and drivingly connected thereto, said clutch means being shiftable axially to establish a positive driving connection between said member and said part, means drivingly connected to said part and extending between said first and second synchronizer elements and said sychronizer elements being engageable with said means to establish said frictional driving connection.



3,272,292
VISCOUS FLUID CLUTCH HAVING HEAT DISSIPATION MEANS
Alex Sutaruk, Hazel Park, Mich., assignor to Eaton Yale & Towne Inc., a corporation of Ohio
Filed Oct. 11, 1963, Ser. No. 315,581
3 Claims. (Cl. 192—58)

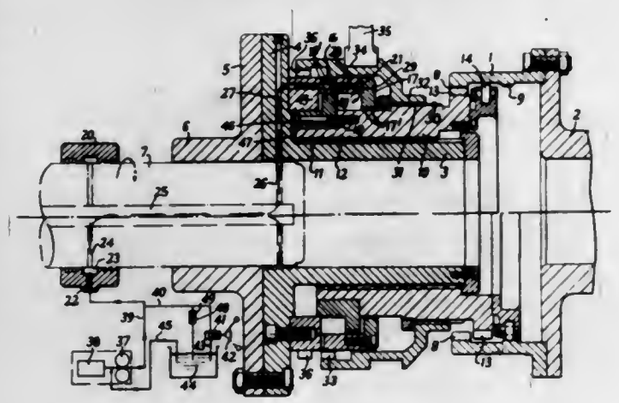
1. A drive coupling comprising first and second relatively rotatable coupling members, said first coupling member defining a fluid chamber in which said second coupling member is rotatable, said first and second coupling members having opposed spaced parallel surfaces defining a fluid shear space therebetween and cooperable with a fluid shear medium in said shear space to provide a shear-type fluid drive therebetween, means for varying the volume of fluid shear medium in said shear space to vary the torque transmitted between said first and second coupling members including a temperature responsive device located on a forward face of said first coupling member

and responsive to the temperature of the atmosphere adjacent said forward face to effect a change in the volume of the fluid shear medium in said shear space, a plurality of blower blade means disposed circumferentially about and in surrounding relation to said temperature responsive device and connected to said first coupling member, said blower blade means being inclined with respect to a radial line extending through the axis of rotation of said coupling members for creating a flow of air across said temperature responsive device to prevent stagnation of air around said temperature responsive device.



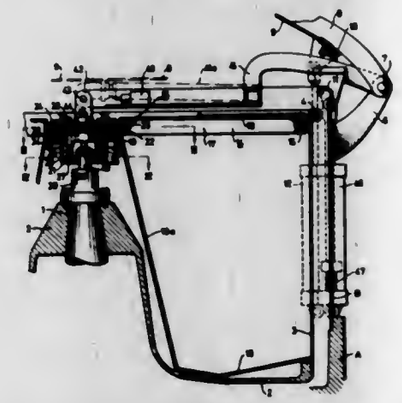
3,272,293
VISCOUS FLUID CLUTCH WITH FLOW CIRCULATION MEANS
Richard William Hester, Marshall, Mich., assignor to Eaton Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Filed Mar. 2, 1964, Ser. No. 348,572
8 Claims. (Cl. 192—58)

1. A fluid coupling of the shear type comprising relatively rotatable coupling members, one of said coupling members defining a fluid working chamber and the other of said coupling members being rotatable in said fluid working chamber, said coupling members having opposed spaced surfaces providing a fluid shear space therebetween and co-operable with a fluid shear medium in said shear space to transmit torque between the coupling members, a reservoir chamber communicating with said working chamber, means for effecting fluid flow into said shear space from the reservoir chamber to vary the torque transmitted between said input and output coupling members, and notch means provided on the outer periphery of the other coupling member and operable to retard the rate of fluid flow from the reservoir chamber into said shear space.



3,272,294
DRIVING MECHANISM OF KNITTING MACHINES
Carlyle Herbert Wainwright, Leicester, England, assignor to The Bentley Engineering Company Limited, Leicester, England
Filed Sept. 2, 1964, Ser. No. 393,975
Claims priority, application Great Britain, Sept. 4, 1963, 34,915/63; July 23, 1964, 29,218/64
8 Claims. (Cl. 192—66)

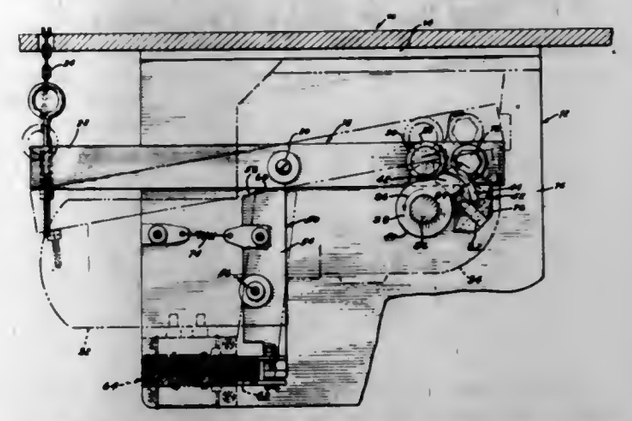
1. A knitting machine driving mechanism comprising a rotatable input member, a rotatable output member, a friction clutch comprising co-operating driving and driven rotatable friction members coupled respectfully to said input and output members, means mounting said output and input members and said driving and driven friction members for rotation and for movement of one of the friction members axially into and out of engagement with the other, a screw threaded abutment co-operating with the axially movable friction member, a screwed mounting on which said abutment member is carried in screw-threaded engagement so that when the abutment member is turned appropriately the axially movable friction member is urged towards the other friction member to engage the clutch, a rotatable member coupled to one of said



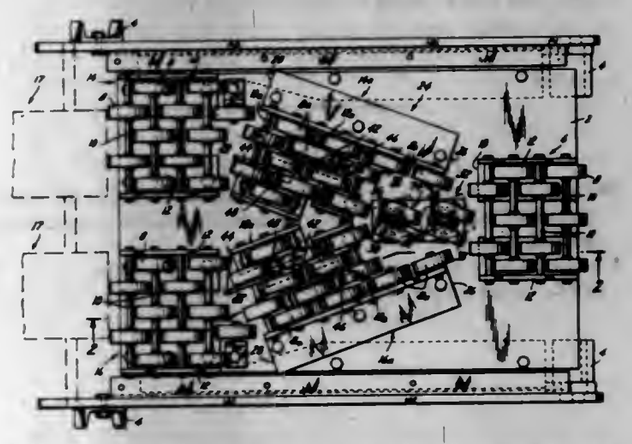
input and output members to rotate therewith in a direction appropriate for turning the abutment member to release the clutch, and a catch lever carried by said abutment member and movable into and out of engagement with said rotatable member, wherein said rotatable member is a toothed wheel and the catch lever is provided with an end portion engageable with the teeth of the toothed wheel.

3,272,295
ROTARY CLUTCHES
Herbert Arthur Clements, Weybridge, Surrey, England, assignor to S.S.S. Patents Limited, London, England
Filed Sept. 28, 1964, Ser. No. 399,593
Claims priority, application Great Britain, Sept. 30, 1963, 38,474/63
5 Claims. (Cl. 192—67)

1. A rotary toothed clutch comprising a first rotary clutch member and a secondary clutch member, an intermediate member, means constraining said intermediate member for helical movement relative to said second clutch member in one helical direction to engage the clutch teeth at least partially and in the other helical direction to disengage said clutch teeth, the application of driving torque to the clutch in one angular direction, with said clutch teeth engaged, tending to disengage said clutch teeth by relative helical movement of said intermediate member in said other helical direction, clutch locking means adjustable, with the clutch engaged, to an operative setting in which said locking means oppose said relative helical movement of said intermediate member in said other helical direction, whereby disengagement of the clutch under the action of driving torque is opposed by a loaded condition of said locking means that oppose adjustment of said locking means out of said operative setting, and the clutch including load relief means energizable from a controllable power source to urge said intermediate member in said one helical direction when the clutch is engaged, whereby to relieve said locking means from said loaded condition and thereby enable said clutch locking means to be adjusted out of said operative setting, so that the clutch is disengageable under the action of driving torque when said load relief means cease to be energized.



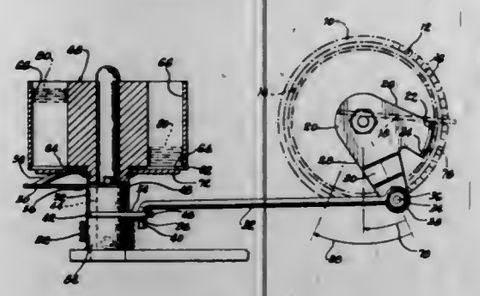
3,272,296
COVER LOCKING DEVICE FOR WASHING CENTRIFUGES
Gunnar Ivar Fredholm, Stockholm, Sweden (Forfattarvagen 44, Bromma, Sweden)
Filed Mar. 12, 1964, Ser. No. 351,484
Claims priority, application Sweden, Mar. 14, 1963, 2,785/63
7 Claims. (Cl. 192—136)



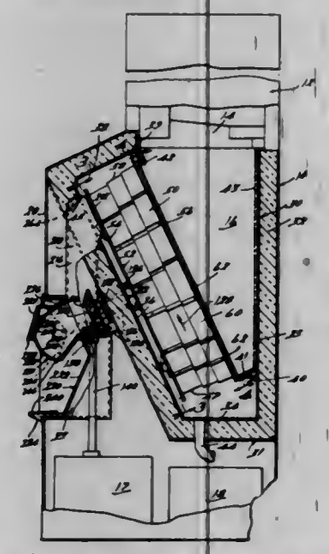
1. For a centrifuge having a main drive shaft and a basket driven by said shaft: a cover adapted for being placed on the basket and coupled to the drive shaft, actuator means engageable with said cover for placing the same on the basket and for removing the same there from, first and second locking means respectively on said shaft and said actuator means, and means secured to said cover for locking the same selectively with said first and second locking means, the locking of the latter means with one of the aforementioned said locking means releasing the other of said locking means.

3,272,297
STOP FOR CONTROL OF BUTTON SEWING MACHINE
Charles D. Leslie, Pittsford, N.Y., assignor to Speed Feed Machine Co., Rochester, N.Y.
Filed Sept. 9, 1964, Ser. No. 395,248
2 Claims. (Cl. 192—139)

1. In a remotely controlled actuator device, in combination,
- a support frame and having a cam engaging member thereon,
- an actuating lever pivotally mounted on said frame,
- a drive assembly mounted on said frame and including a drive shaft,
- cam means on said drive shaft and engaging said cam engaging member for rocking said lever about its pivot in response to rotation of said drive shaft,
- means for indexing said drive shaft to a position in which said cam means is at the initiation of lever rocking action, such means including a locking bar normally engaging said lever for blocking rotation of said drive shaft beyond the indexed position thereof, and locking dog mechanism carried by said lever and spaced from said cam engaging member to normally hold said cam means captive therebetween for blocking rebound motion of said cam means,
- and mechanism for moving said locking bar out of blocking engagement with said actuating lever.

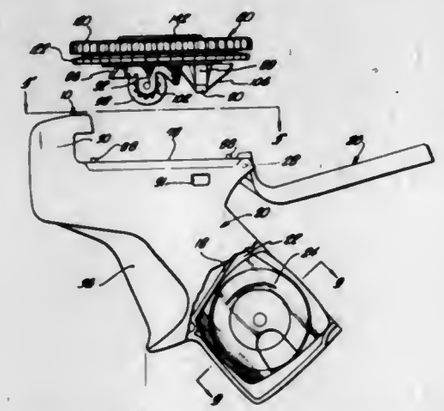


3,272,298
MULTI-PATH FEED IN A CONVEYOR ASSEMBLY
Carl P. Cato, Lynchburg, Va., assignor to Ducam Corporation, Lynchburg, Va., a corporation of Virginia
Filed Feb. 5, 1964, Ser. No. 342,616
6 Claims. (Cl. 193—36)



1. A conveyor comprising an input track portion along which a succession of articles are adapted to pass, first and second output track portions communicating with said input track portion and extending along different paths from a diverging station on said input track portion, said articles being adapted to pass from said input track portion to one or the other of said output track portions, first and second article guiding means at said diverging station and spaced from one another in a direction generally toward said output track portions, said second guiding means being closer to said output track portions than is said first guiding means, each of said guiding means being adapted to be engaged by and to guide said articles as they pass from said input track portion to one of said output track portions and each being movable between first and second operative positions oriented toward said first and second output track portions respectively, thereby to guide said articles into the output track portion toward which they are oriented, and control means for said guiding means, said control means being effective first to shift said first guiding means from first operative position to second operative position or vice versa, and thereafter to correspondingly shift said second guiding means.

3,272,299
TOKEN DISPENSING APPARATUS FOR PARKING METERS
Lester D. Sollenberger, Oak Park, Ill., assignor to Duncan Parking Meter Corporation, Chicago, Ill., a corporation of New York
Filed Oct. 19, 1964, Ser. No. 404,816
7 Claims. (Cl. 194—2)

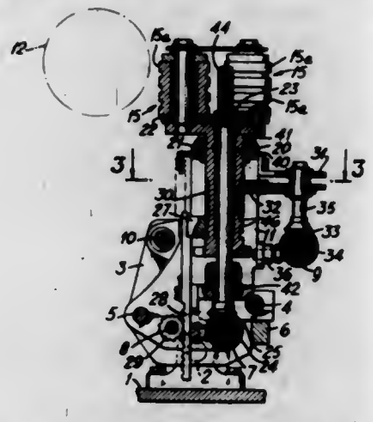


1. In a token dispensing parking meter device wherein tokens are dispensed by the meter after the insertion of a coin for setting of time on the meter, and wherein setting of the time is effected through engagement of pawl means with a rotary ratchet wheel, the improvement in means for carrying out dispensing of the tokens comprising a lever mounted for oscillating movement, said lever being mounted coaxially with said ratchet wheel and being connected to said wheel for movement therewith, a dispenser operating extension operatively connected to said lever at a point on the lever remote from the axis thereof whereby oscillation of said lever effects movement of said extension and operation of said dispenser, and including ratchet teeth formed in said lever, said pawl engaging said ratchet teeth for movement of said lever simultaneously with the rotation of said ratchet wheel for dispensing of tokens when a coin is inserted.

3,272,300
ICE VENDING MACHINE
Walter H. Hoenisch, Albert Lea, Minn., assignor to King-Seeley Thermos Co., Ann Arbor, Mich., a corporation of Michigan
Continuation of application Ser. No. 214,666, Aug. 3, 1962. This application June 29, 1965, Ser. No. 470,331
26 Claims. (Cl. 194—2)

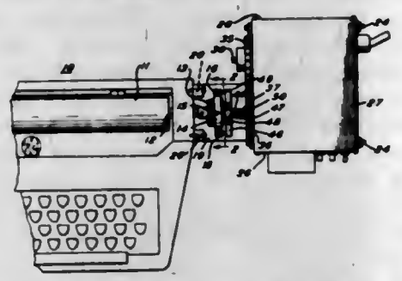
1. An ice cube vending machine comprising ice cube manufacturing means for the manufacture of ice cubes, storage bin means providing an ice cube storage area for ice cubes manufactured in said ice cube manufacturing means, ice cube delivery means connecting said ice cube manufacturing means and said storage bin means for delivering ice cubes to said storage bin means, movable ice cube agitating and dispensing means provided in said storage bin means and forming a part of the ice cube storage area enclosure and including the lowermost portions of said storage bin means, whereby all of the ice cubes in said storage bin means are at least partially supported by said ice cube agitating and dispensing means and are subject to agitation during movement thereof, ice cube vending means communicating with said storage bin means at a point spaced above the lowermost portions of said storage bin means and adapted to receive predetermined quantities of ice cubes from said storage bin means, and power means to actuate said ice cube agitating and dispensing means and move ice cubes from said storage bin means into said ice cube vending means by movement of ice cubes from the lowermost portions of said storage bin means upwardly to said point spaced thereabove.

3,272,301
EMBOSSING TOOL HAVING REMOVABLE DIE UNITS TO ACCOMMODATE VARIOUS WIDTH TAPES
Burnie M. Craig, Pasadena, Calif., assignor to Avery Products Corporation, Pasadena, Calif., a corporation of California
Filed Aug. 10, 1964, Ser. No. 388,596
15 Claims. (Cl. 197—6.7)



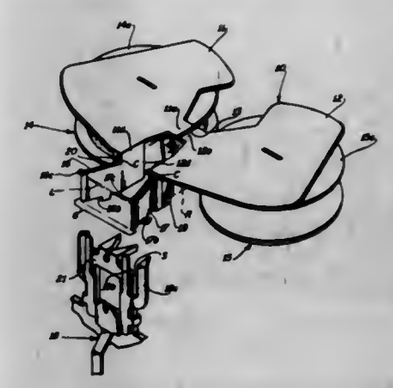
1. A tool for embossing a continuous strip of material comprising a unitary die assembly including two apposed die discs rotatively tied together for selection of any one of a set of pairs of corresponding dies including embossing dies of preselected size carried on the discs and for positioning the selected pair of dies on opposite sides of the strip of material at a forming station, feed means for engaging the strip of material to advance it upon actuation of the feed means a distance corresponding to the preselected die size, locking means for removably securing the die assembly to a tool base, and strip guide means in the assembly to guide the strip to the forming station; and a separable tool base including means to actuate the feed means to advance the strip of material and means for actuating the selected pair of dies positioned at the forming station when the die assembly is secured to the tool base.

3,272,302
PRINTING MECHANISM FOR TYPEWRITERS HAVING PLURAL TYPEWHEELS
Kaoru Segawa and Hideo Ozaki, both of Tokyo, Japan, assignors to Nippon Electric Company, Limited, Tokyo, Japan, a corporation of Japan
Filed Oct. 12, 1964, Ser. No. 403,285
Claims priority, application Japan, Oct. 17, 1963, 38/55,535
5 Claims. (Cl. 197—50)



1. A printing mechanism for a typwriter comprising a carriage and a typehead mounted on said carriage and movable thereon,

a plurality of typewheels mounted in said typehead, said typewheels each having a plurality of groups of type characters at spaced positions thereon,
a vertically disposed cylindrical sleeve pivotally mounted on said carriage to permit both rotary and vertical motion thereof, said typewheels being supported on said cylindrical sleeve,
a central shaft disposed within said cylindrical sleeve and mounted so as to permit rotary motion thereof,
a gear mechanism between said central shaft and each of said typewheels for transmitting rotation of said central shaft to all of the typewheels simultaneously at any vertical position of said cylindrical sleeve,
a rotary driving force transmission means for said cylindrical sleeve,

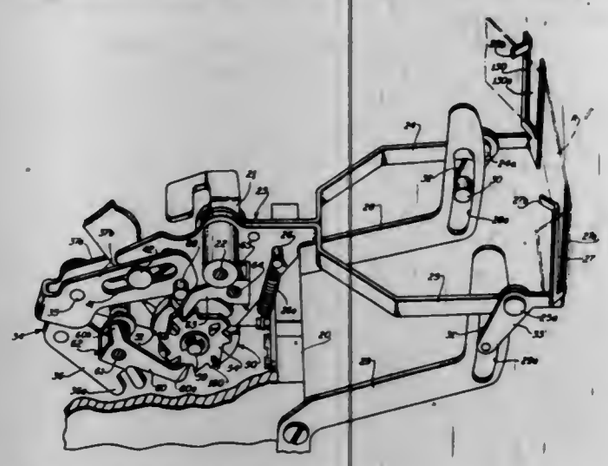


a vertical driving force transmission means for said cylindrical sleeve including circumferential flanges on said sleeve and means engaging said flanges to impart vertical motion to said sleeve while allowing rotation of the same,
and a rotary driving force transmission means for said central shaft regardless of the rotary and vertical motion of said cylindrical sleeve, whereby selection of one of the typewheels, selection of a group of a selected typewheel, and selection of an individual type character in the selected layer of the selected typewheel can be performed simultaneously by rotation of said cylindrical sleeve, vertical motion of said cylindrical sleeve, and rotation of said central shaft.

3,272,303
TYPEWRITER CONTROL APPARATUS
Carl Pohl, 308 19th St. S., Brigantine, N.J. 08203
Filed Feb. 10, 1965, Ser. No. 431,570
10 Claims. (Cl. 197—114)

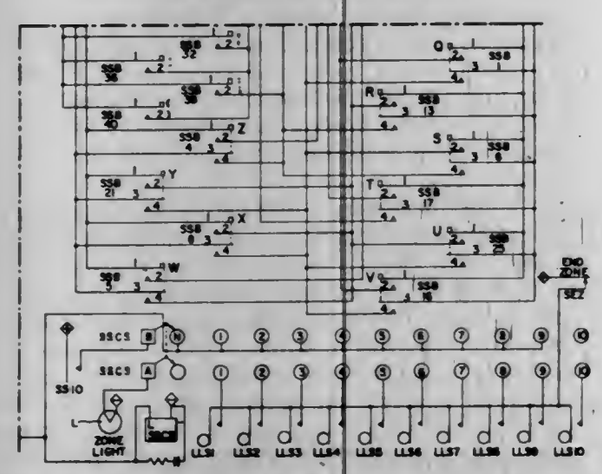
1. Apparatus for line of writing control of a typewriter having a rotatable platen with a member for rotating the platen comprising a frame, a rotary electric motor mounted on said frame, a linearly movable member for driving engagement with said platen rotating member, and means for controlling the actuation of said movable member by said motor, said movable member having a resilient element in engagement therewith for urging it in one direction, said means including a solenoid controlled device for moving said movable member in the opposite direction against the force of said resilient element, and a releasable locking member for retaining said movable member at a predetermind position.

3,272,304
TYPEWRITER RIBBON PACKAGE
Joseph L. Morelli, Hartford, Conn., assignor to Royal Typewriter Company, Inc., New York, N.Y., a corporation of Delaware
Filed May 10, 1965, Ser. No. 454,404
1 Claim. (Cl. 197—151)



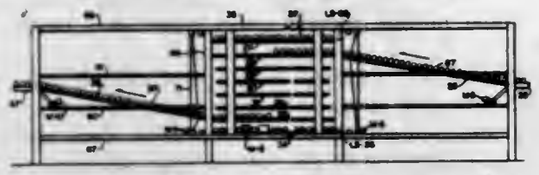
A typewriter ribbon spool package comprising in combination a pair of ribbon spools having spool drive spindle receiving cores and coaxial flanges, a ribbon wound on one of said spools and extending to and attached to the other of said spools, and a throw-away element releasably secured to said cores and maintaining said spools in closely spaced relationship with their axes parallel during storage and handling,
said element comprising a pair of flat plates separably joined in substantially edge to edge relationship,
posts integral with and depending orthagonally from each plate, said posts having radial projections adapted to releasably lock said posts within said cores when inserted therein, thereby to hold said spools closely spaced and to prevent relative axial movement of said posts and cores during handling prior to mounting said spools on a machine,
said plates being formed so that portions of said spool flanges remain uncovered when said posts are locked to said cores,
ribbon guides depending downwardly from said plates and extending outwardly of the periphery of said spools, said guides forming a gap adapted to be bridged by the ribbon extending between said spools thus to form a loop of ribbon which facilitates insertion of the ribbon within a ribbon vibrator, the uncovered areas of said spool flanges, after the insertion of said ribbon in the ribbon vibrator, the separation of said plates, and the mounting of said spool cores on relatively widely spaced spool drive spindles, being adapted to be pressed downwardly by an operator to carry said posts into contact with said spindles thereby to forcibly eject said posts and plates from engagement with said spools.

3,272,305
RIBBON LIFT MECHANISM
Paul F. Page, Newington, Conn., assignor, by mesne assignments, to Royal Typewriter Company, Inc., New York, N.Y., a corporation of Delaware
Original application Sept. 12, 1962, Ser. No. 223,159. Divided and this application Oct. 22, 1965, Ser. No. 501,080
2 Claims. (Cl. 197—159)



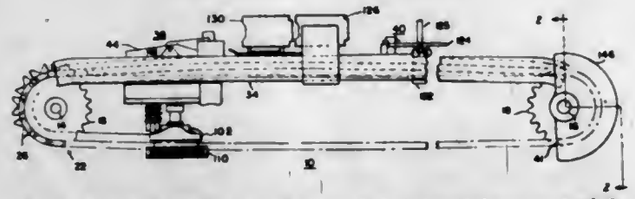
1. In a mechanism for moving a typewriter ribbon vertically with respect to a point of contact between a print element and a hammer or platen, the combination of,
a frame,

a pair of outwardly extending vibrator arms pivotally mounted on said frame the ends of said arms describing an arcuate path during pivotal movement thereof,
drive means for rocking said arms in synchronism with each typing stroke,
ribbon support means pivotally mounted on said arms for maintaining the ribbon in a vertical plane,



cam means secured to said frame,
and cam follower means secured to said ribbon support means and adapted to engage said cam means thereby to pivot said ribbon support means on said arms such that said ribbon support means are maintained in a vertical plane when said arms are rocked.

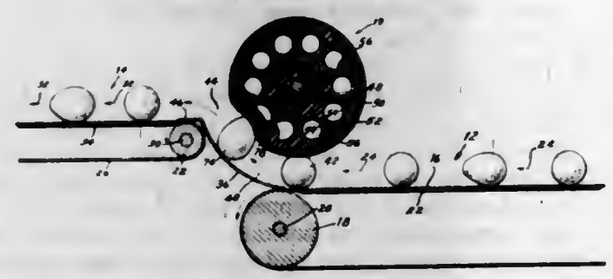
3,272,306
JUSTIFICATION ZONE-INDICATING COUNTER
Frank A. De Witt and Wilbur C. Ahrns, Rochester, N.Y., assignors, by mesne assignments, to Friden, Inc., San Leandro, Calif., a corporation of Delaware
Filed Mar. 19, 1963, Ser. No. 266,430
9 Claims. (Cl. 197—187)



1. A justification-zone indicating counter comprising first word-space-selection means for preselecting an individual one of any of plural available minimum-word-space unit values, accumulator means movable in discrete unit-valued steps to accumulate the total length of a line of alpha-numeric characters and symbols each having an individual preselected unit-value width and including word spaces having said preselected individual word-space unit value, means for counting the number of word spaces in each said line, electrical-contact actuating means movable with said accumulator means for preselecting any of plural maximum-justification-expansion word-space unit values, and means including stationary electrical contacts controlled by said actuating means and responsive to the prevailing count of said counting means for providing an indication of the zone within which each said line length is justifiable.

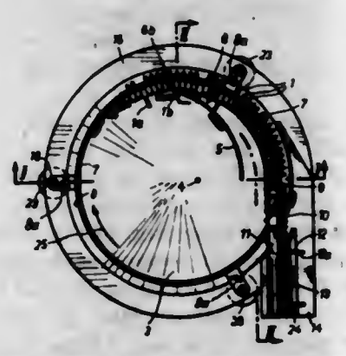
3,272,307
CONVEYOR SYSTEM
Fred L. Waite, 1435 Bedford St., Stamford, Conn.
Filed May 17, 1965, Ser. No. 456,356
13 Claims. (Cl. 198—1)

1. In a conveyor system having an adjustable holdup capacity, infeed conveyor means, outfeed conveyor means, a plurality of discrete conveyor means sequentially in parallel between said infeed conveyor means and said outfeed conveyor means, switching means connected to said infeed conveyor means, said switching means switching successively in a predetermined sequence to each of said discrete conveyor means, a second switching means connected to said outfeed conveyor means, said second switching means switching successively to each of said discrete conveyor means, said second switching means following at a predetermined time interval the successive switching of said first switching means.



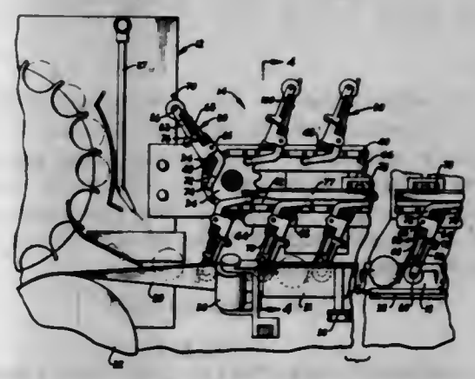
3,272,308
MECHANICAL LOADER AND CONVEYOR MECHANISM FOR HANDLING RELATIVELY SMALL AND BREAKABLE ARTICLES
Ralph E. Mottin, Grosse Pointe Park, Mich., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan
Continuation of application Ser. No. 271,535, Feb. 12, 1963, which is a division of application Ser. No. 857,150, Dec. 3, 1959. This application Apr. 19, 1965, Ser. No. 449,205
4 Claims. (Cl. 198—19)

1. In a machine for performing an operation on articles such as ampoules or the like the combination of a conveyor mechanism for transporting the articles in the machine comprising a pair of rotatably mounted sprockets having their axes disposed generally horizontally and spaced apart in generally parallel relation, an endless chain passed around said sprockets, means for intermittently driving the chain around said sprockets such that said chain has an indexing motion whereby the chain is alternately accelerated and decelerated as it is started and stopped by said chain driving means, said chain having means thereon for supporting articles to be transported, at least a portion of the upper run of the chain serving as an article transport portion along which articles are adapted to be carried by the chain, a continuously curved support underlying and contacting the chain throughout the extent of said article transport portion thereof, said support being curved upwardly in an outwardly convex direction relative to an imaginary straight line connecting the axes of the two sprockets so as to maintain said portion of the chain in a taut condition, said continuously curved support having a high point intermediate its ends such that said portion of the chain is elevated in traveling to and from said high point whereby said chain exerts force perpendicularly against the curved support throughout the extent thereof in a downward direction and longitudinally of the path of travel of the chain to thereby minimize the tendency for the chain to ripple or otherwise move out of



contact with the curved support upon acceleration and deceleration thereof, and work station means positioned adjacent said high point of said support including movable means in registry with a stopped position of said article support means at said high point and operable in timed relation with the indexing motion thereof to engage an article thereon during the stopped condition of the chain for temporarily supporting the article while an operation is performed thereon by said work station means.

3,272,309
EGG HANDLING APPARATUS
Walter J. Reading, Ottumwa, Iowa, assignor, by mesne assignments, to Barker Poultry Equipment Company, Ottumwa, Iowa, a corporation of Iowa
Filed Sept. 1, 1964, Ser. No. 393,648
14 Claims. (Cl. 198—25)

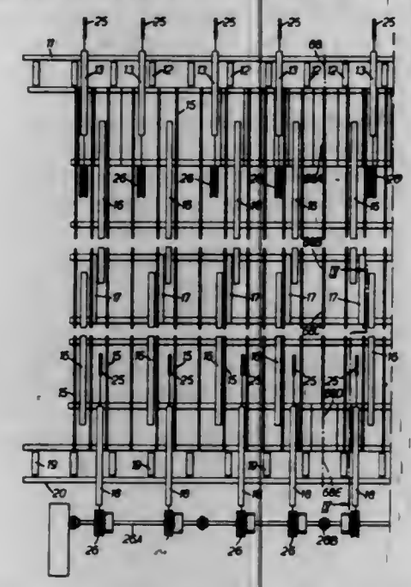


1. A device for transferring eggs from one level to another comprising, in combination,
means at one level for delivering eggs to an input area,
means for receiving and transporting eggs from a discharge area located at a level different from said one level,
an arcuate ramp bridging between said input and discharge areas,
a cylindrical transport member having a peripheral surface portion disposed in spaced relation to said ramp to define an egg-transport channel having said input and discharge areas at the opposite ends thereof, said transport member being formed of resilient material and having a series of circumferentially spaced openings extending axially therethrough in radially inwardly spaced relation to the peripheral surface of said transport member,
and means for rotating said transport member.

3,272,310
APPARATUS FOR ORIENTING ARTICLES PARTICULARLY AMPOULES
Eduard Blickisdorf and Willi Landenmann, Zurich, Switzerland, assignors to Memmel & Co. Aktiengesellschaft, Basel, Switzerland
Filed Nov. 24, 1964, Ser. No. 413,441
Claims priority, application Switzerland, June 2, 1964, 7,181/64
9 Claims. (Cl. 198—33)

1. Apparatus for uniformly orienting and arranging articles in consecutive order, comprising a rotatable turntable mounted for rotation about a vertical axis and having an article receiving upper face conically sloping from the center thereof towards the periphery, an article supply hopper above said surface to deliver articles to be oriented upon said turntable, a circularly curved outer guide wall extending over and in proximity of the periphery of said turntable and having a lower edge in spaced relationship with said upper face thereof, a circularly curved inner guide wall extending parallel to said outer guide wall over a portion of the length thereof in radially spaced relationship, said two guide walls forming a pathway between themselves for the articles to be oriented and moved along said pathway by the rotating turntable, and baffle members arranged in the space between said two guide walls and acting to expulse incorrectly oriented articles from said pathway and returning them on said turntable.

3,272,311
FRUIT ORIENTOR
Roland F. Blakewell, Oakland, Lawrence H. Smith, Walnut Creek, and Malcolm W. Loveland, Orinda, Calif., assignors to Atlas-Pacific Engineering Co., a corporation of California
Filed May 3, 1965, Ser. No. 452,479
7 Claims. (Cl. 198—33)

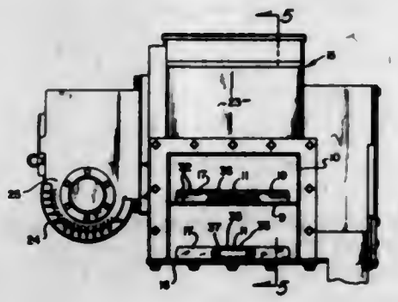


1. A fruit orientor or the like comprising in combination:
(a) a pair of flat belts having a substantially horizontal run, said belts having their outer edges deflected upward and toward each other, whereby a V-shaped trough is formed therebetween;
(b) a plurality of orienting arms, said arms extending downwardly into the V-shaped space between the belts, said spaced arms defining pockets therebetween;
(c) means for driving said belts on said horizontal run;
(d) means for driving said orienting arms on substantially the same horizontal path, said belts being driven at a substantially higher rate of speed than said orienting arms, whereby said orienting arms are brought into contact with fruit being carried by said belts.

3,272,312
COOLING BEDS
Patrick Alwyne Clark and James Francis Alsop, Sheffield, and Joseph Eric Ogle, Chapeltown, Sheffield, England, assignors to Davy and United Engineering Company Limited, Yorkshire, England
Filed Feb. 13, 1964, Ser. No. 344,694
Claims priority, application Great Britain, Feb. 14, 1963, 6,004/63
12 Claims. (Cl. 198—34)

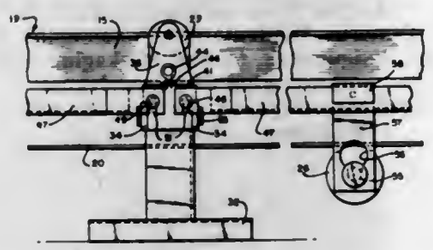
1. Apparatus for effecting controlled cooling of hot objects, said apparatus comprising two adjacent cooling tables forming first and second sections of a cooling bed, first transfer means for positioning successive objects to be cooled on the first section table, second transfer means for transferring said objects from said first section table to the second section table and first and second conveying

means associated respectively with said first and second tables and arranged to move said objects across said tables, said first transfer means being adjustable in operation to position successive objects at different positions on said first table so that said objects are conveyed by said first conveying means across said first table with a selectively variable and substantially equal first spacing,



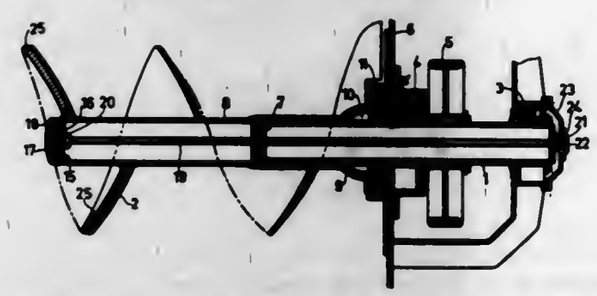
and said second transfer means being adjustable in operation to transfer said objects to said second table with a selectively variable and substantially equal second desired spacing differing from said first selectively variable and substantially equal spacing so that said objects are conveyed across said second table by said second conveying means with said second spacing.

3,272,313
UPWARD MAGNETIC CAN CONVEYOR
Steve Sarovich, Chicago, Ill., assignor to The Sardee Corporation, Chicago, Ill., a corporation of Illinois
Filed Sept. 15, 1964, Ser. No. 396,682
3 Claims. (Cl. 198—41)



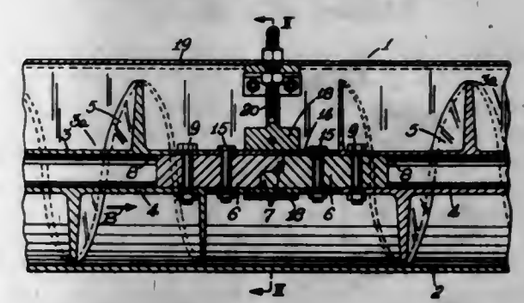
1. An upward magnetic conveyor for conveying magnetic sensitive containers comprising:
an elongated frame having an upper and lower end;
a rotating means interposed between the upper and lower ends of said frame;
an endless conveyor belt located around said rotating means and rotating therearound, said belt including a rising section having an upper portion near the upper end of said frame and a lower portion near the lower end of said frame, and the thickness of said rising section affording a front side and a back side;
a driver means operatively connected to said rotating means for producing the rotation of said belt;
a magnetic means associated with said frame, said magnetic means facing the back side of said belt and extending substantially from adjacent said lower portion to adjacent said upper portion of said belt, for magnetically attracting and maintaining the containers into contact with said front side as said belt travels upwardly;
an input means associated with the lower end of said frame and the lower portion of said belt, said input means presenting containers to said belt for being attracted thereto in response to the magnetic field of said magnetic means;
an upper plate disposed at the upper end of said frame, said upper plate being situated above said upper portion of said belt to direct said containers away from said upper portion of said belt whereby said containers are prevented from following the movement of said belt; and
an output means having an upper elbow and an upper arm integrally extending from said upper elbow, said upper arm and said upper elbow defining a path through the output means, said upper elbow being attached to the upper end of the frame and facing said upper plate, said upper arm being adjacent to said upper plate and positioned to the side of said belt, said upper elbow and said upper plate contacting said containers after said containers are ejected upwardly from said belt, said upper plate providing a sliding surface for said containers to guide said containers into said path.

3,272,314
UNDER-BUNKER CONVEYOR
Arthur J. Stock, Lakewood, Ohio, assignor to Stock Equipment Company, Cleveland, Ohio, a corporation of Ohio
Filed Jan. 6, 1964, Ser. No. 335,773
5 Claims. (Cl. 198—159)



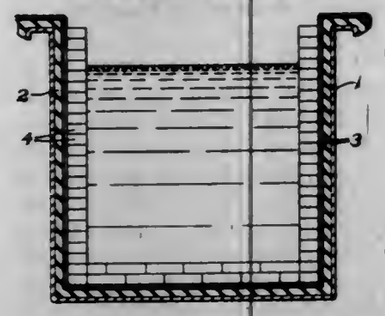
1. An under-bunker conveyor of the type having an endless chain trained over horizontally spaced apart sprockets and provided with transverse drag bars which upon driving of one of said sprockets move successively in opposite directions with the upper course of said chain in contact with an upper support of a conveyor housing and with the lower course of said chain in contact with a lower support of said housing, bulk material on said upper support being dragged by said drag bars for discharge therefrom onto said lower support and thence being dragged by said drag bars in the opposite direction along said lower support toward said one sprocket and for discharge through an opening in said lower support, said conveyor being characterized in that an extension of said upper support is disposed beneath said chain adjacent the upper portion of said one sprocket, and in that said drag bars have concave leading faces which function as scoops for conveying residual material not discharged through such opening around said one sprocket for deposit on said extension for recirculation through said conveyor housing.

3,272,315
EXTENSIBLE BELT CONVEYOR
Robert M. Promin, Clifton, and William F. Bankauf, East Paterson, N.J., assignors to Litton Industries, Inc., a corporation of Delaware
Filed Dec. 20, 1963, Ser. No. 332,033
4 Claims. (Cl. 198—204)



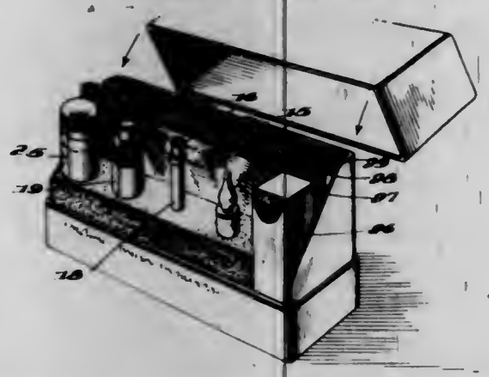
1. A conveyor belt mechanism, comprising upright standards, a belt, an idler roller troughing assembly extending transversely under one run of said belt, arm means carried by the upright standards supporting the roller assembly, brackets, means for connecting each of said brackets to one of said standards for movement relative thereto in directions lengthwise of the belt, means for releasably securing the brackets to the respective upright standards against movement, side rail sections, means for detachably connecting said side rail sections and said brackets, a return idler roller extending transversely under another run of said belt, hanger brackets carried by said side rail sections supporting said return idler roller, said hanger brackets being movable along the respective side rail sections, and means maintaining the hanger brackets in fixed positions relative to said side rail sections.

3,272,316
REFUSE COLLECTING CONTAINER WITH A FEED SCREW
Hilding Linde, Kalmar, Sweden, assignor to Norba Aktiebolag, Blomstermala, Sweden
Filed Dec. 26, 1963, Ser. No. 333,506
The portion of the term of the patent subsequent to March 31, 1981, has been disclaimed
1 Claim. (Cl. 198—213)



A rotary conveyor screw for forcing refuse into a collecting container, comprising a wall constituting part of said container; a driving means; a hollow driving shaft drivingly coupled to said driving means and extending through said wall partly into said refuse collecting container; a tubular spindle arranged coaxially with respect to said driving shaft in said refuse collecting container, the outer end of said tubular spindle encasing the inner end of said driving shaft; a screw blade, spirally encircling the outer circumferential surface of said tubular spindle and rigidly secured thereto; a cap which has a smooth, convex inner end surface and sealingly and non-rotatably abuts against the inner end of said tubular spindle and is provided with a threaded hole extending less than completely through said cap and opening outwards, said sealing cap consisting of a material substantially more wear-resistant than that of said tubular spindle; a clamping bolt passing through said hollow driving shaft and said tubular spindle; threads upon the inner end of said clamping bolt in engagement with the threads of said sealing cap; fastening means associated with the outer ends of said hollow driving shaft and said clamping bolt for pressing said tubular spindle onto said driving shaft and for detachably interconnecting them; and a protecting cover of a material more wear-resistant than that of said tubular spindle covering at least the inner portion of said screw blade.

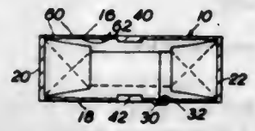
3,272,317
CONVEYORS
Frederick Christopher Kelly, Kensington, Johannesburg, Transvaal, Republic of South Africa, assignor to Fred Kelly & Sons (Proprietary) Limited
Filed June 25, 1964, Ser. No. 378,019
Claims priority, application Republic of South Africa, July 10, 1963, 63/3,097
5 Claims. (Cl. 198—213)



1. A coupling for connecting conveyor screw members having tubular shaft ends, for the formation of a screw conveyor, including a first connecting element adapted to be anchored to a screw member in a tubular end thereof with part of the element projecting from the tubular end; a second connecting element adapted to be anchored to an adjacent screw member in similar fashion; torque transmitting formations associated with the ends of the projecting parts of the elements for effecting a driving connection directly between the elements, the torque transmitting formation of one of said elements having a surface closely engaging in torque transmitting overlapping relationship a mating surface of the torque transmitting formation of the other of said elements, each said surface being at an angle to a plane perpendicular to the axis of said first and second elements, said formations being laterally separable to permit lateral removal of a screw member from the conveyor without axial movement of an adjacent screw member; and a retaining sleeve located in a gap between the screw members and embracing the formations and holding them against lateral separation, the sleeve providing a bearing surface for engagement with a support bearing and comprising at least two parts, each part being releasably anchored to each of the connecting elements at positions located between said formations and the other ends of said projecting parts for rotation therewith, and means for anchoring said sleeve parts to said connecting elements, the sleeve parts being releasable to permit removal of the sleeve and subsequent lateral separation of the formations, said support bearing engaging the sleeve between said means.

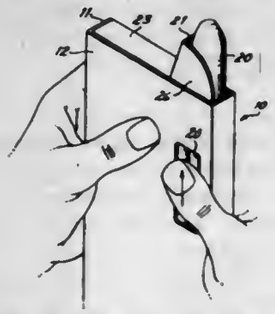
3,272,318
LINING FOR ACID TANKS AND METHOD OF USE
Theodore E. Saxman, Akron, Ohio, assignor to The B. F. Goodrich Company, New York, N.Y., a corporation of New York
Filed May 5, 1965, Ser. No. 453,446
7 Claims. (Cl. 206—2)

3. An acid tank comprising a metal shell, a lining of hard rubber bonded to the shell, polyvinyl chloride film material adhered to the hard rubber lining by a neoprene adhesive, and an internal sheathing of carbon brick.



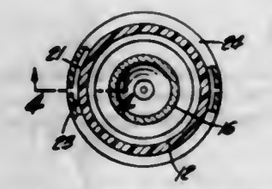
3,272,319
IMMUNOLOGICAL TEST KIT
John H. Brewer, Towson, Md., assignor to Hynson, Westcott & Dunning, Incorporated, a corporation of Maryland
Filed Oct. 5, 1962, Ser. No. 228,640
3 Claims. (Cl. 206—12)

1. A kit for the performance of immunological tests comprising a container and within said container a non-absorbent test card provided with at least one marked area adapted to receive the test reagent, an antigen dispensing bottle provided with a nozzle for the delivery of antigen suspension to said area, means for delivering a measured amount of the serum or plasma of the blood of a person to be tested to said area, at least one stirring rod for mixing said antigen suspension and serum or plasma in said area and a control card having at least one marked area on the surface thereof containing a deposit of a known reactive serum or plasma and at least one marked area containing a deposit of a known non-reactive serum or plasma.



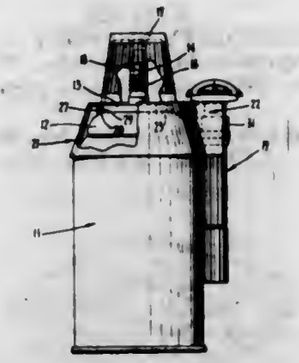
3,272,320
CIGARETTE PACKAGE
Arthur V. Brungardt, 3252 Farnam St., Omaha, Nebr.
Filed Mar. 16, 1964, Ser. No. 352,079
4 Claims. (Cl. 206—41)

1. In a collapsible cigarette package: a box-like collapsible enclosure comprising spaced normally parallel front and rear panels, two spaced side panels, and means connecting adjacent ones of said front, rear and side panels to form an annular enclosure wall, the said enclosure wall having spaced vertical rectangular stiffening portions of greater stiffness than portions of said enclosure wall disposed between said stiffening portions whereby said stiffening portions tend to confine bending of said enclosure wall to areas disposed between said stiffening



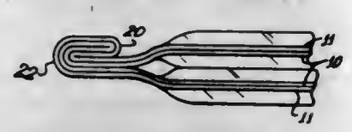
portions for neat and orderly folding, means for at least approximately closing the top and bottom areas between said panels.

3,272,321
PACKAGING OF CIGARS OR THE LIKE
Bernard J. Tamaria, Whitemarsh, Pa., assignor, by direct and mesne assignments, to Pull Packaging, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Filed Mar. 26, 1964, Ser. No. 355,117
16 Claims. (Cl. 206—41.2)



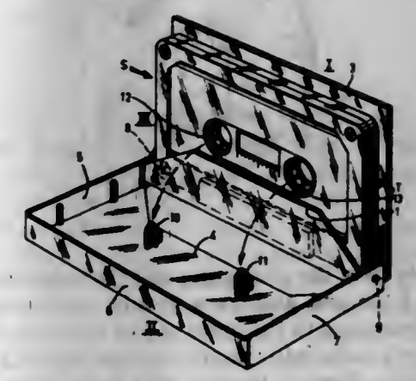
1. In a portable package of cylindrical articles arranged side by side in a row, a single row only of cylindrical articles so arranged, a container of rectangular plan enclosing the articles as a group, the articles being covered thereby at each end, one end surface of the container being covered in minor part only by a cover flap joined to a wide side wall, an end closure swingably openable along a hinge line crossing the flap substantially perpendicular to its junction to the side wall and nearer to one of the narrow side walls than the other, the distance of the hinge line from the nearer narrow side wall being at least one but less than two diameters of the cylindrical articles, the openable end closure having a portion thereof oriented perpendicular to the end of the container and to the rest of the openable end closure and effective to rigidify and guide it during opening and closing thereof.

3,272,322
SYRINGE PACKAGE
Robert W. Ogle, Phoenix, Ariz., assignor to Syn-Pak Corporation, a corporation of Delaware
Filed Aug. 25, 1964, Ser. No. 392,056
1 Claim. (Cl. 206—43)



A syringe package comprising a syringe with a needle attached to its end; a needle sheath covering and sealing the needle; said needle sheath having a collar; an annular groove in the inner wall of said collar; a cylindrical member positioned over the syringe, said cylindrical member having a closed end and an open end; an outstanding flange on said cylindrical member immediately adjacent its open end, said flange being received in said annular groove securing said cylindrical member to said needle sheath; said needle sheath being spotwelded to said cylindrical member at a plurality of points.

3,272,323
DEVICE FOR THE SECURANCE OF AN ARTICLE SUCH AS A SAFETY RAZOR TO AN AEROSOL CONTAINER
Edwin Ewry, Mill Valley, Calif., assignor to Avoset Company, Oakland, Calif., a corporation of Delaware
Filed Nov. 3, 1964, Ser. No. 408,534
2 Claims. (Cl. 206—47)

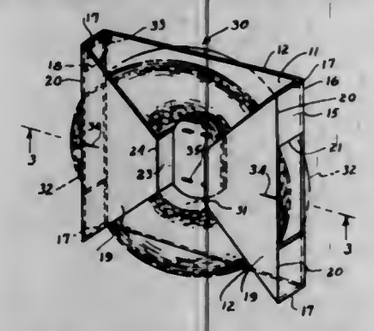


2. A composite package comprising a substantially cylindrical aerosol container having a generally bell-shaped dome at its upper end, said container having an annular bead coaxially of the end surface of said dome and flexible dispensing spout projecting centrally therefrom, said spout having an externally threaded portion, a tapered cylindrical collar of hard plastic, said collar having an open lower end receiving said dome and an upper end with a central circular opening traversed by said spout, said collar having an annular rib depending from its upper end, said rib having an inner peripheral groove complementary to said bead and engaging same in snap fitting relation, said collar having a substantially U-shaped yoke projecting radially from the periphery thereof and defining an outwardly facing notch with a substantially semi-circular cross-section, a safety razor having a shank with an upper portion releasably engaged in said notch, and a cap having a depending internally threaded bushing engaging said externally threaded portion of said spout and securing said cap thereto with the cap engaging said collar.

3,272,324
MULTIPLE COMPARTMENT PACKAGE
William S. Schneider, Glendale, and Arthur P. Corella, North Hollywood, Calif., assignors of ten percent to V. Wayne Rodgers, South Pasadena, Calif.
Continuation of application Ser. No. 305,367, Aug. 29, 1963. This application Apr. 13, 1965, Ser. No. 449,685
20 Claims. (Cl. 206—47)

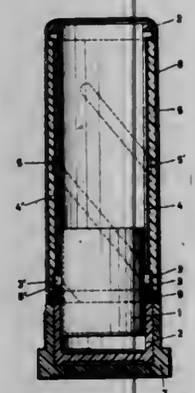
1. A multiple compartment package of thin, flexible, sheet material, comprising:
a pair of overlying outer walls joined together to define between them a product-holding space;
means dividing the product-holding space into two compartments each outside the other;
said means including a self-sustaining fold in both walls extending transversely of the package across the product space holding the outer walls in mutual contact at their inner faces in the region of the fold to prevent product transfer between the compartments;
and a product in each of the compartments;
said fold being capable of being straightened by tension forces applied to the fold by pulling away from each other opposite ends of the package whereby internal communication between the compartments is established.

3,272,325
STORAGE CASE FOR A TAPE CARTRIDGE
Johannes Joseph Martinus Schoenmakers, Emmasingel, Eindhoven, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Apr. 13, 1965, Ser. No. 447,770
Claims priority, application Netherlands, Apr. 15, 1964, 6,404,046
2 Claims. (Cl. 206—52)



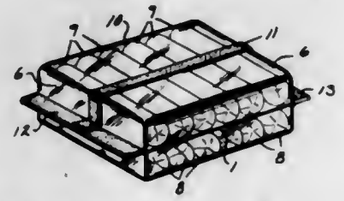
1. The combination of a magnetic tape cartridge and storage container therefor comprising a first open receptacle container portion having a pair of side walls of equal length, an end wall connected with each said side wall at one end thereof, a bottom wall connected with said end wall and said side walls at one edge thereof, said bottom wall extending for only a portion of the length of said side walls defining a cut-away in said first receptacle portion whereby said side walls extend freely beyond said bottom wall; a second container portion comprising a lid wall substantially overlying said side walls over the entire length thereof in the closed position of said first and second container portions, a configured wall in spaced substantially parallel relation with said lid wall, said configured wall having the same shape as said cut-away and being dimensioned for closely fitting within said cut-away in the said closed position, additional lid wall means connected with both said lid wall and configured wall at the aligned edges thereof defining a pouch; a tape cartridge containing at leas one tape reel, said cartridge positioned in said pouch, a major portion of said cartridge projecting beyond said configured wall, means hingedly connecting said first and second container portions for pivotal movement about an axis intersecting said side walls of said receptacle portion at the free ends thereof and passing through said pouch; and fixed means in said first open receptacle container portion locking said reel against rotation within said cartridge in the said closed position of the container portions.

3,272,326
PACKAGE FOR A CORE-LESS COIL
Arthur Katlow, Forest Hills, N.Y.
(38 Manchester Way, Pine Brook, N.J.)
Filed Aug. 24, 1965, Ser. No. 482,067
1 Claim. (Cl. 206—52)



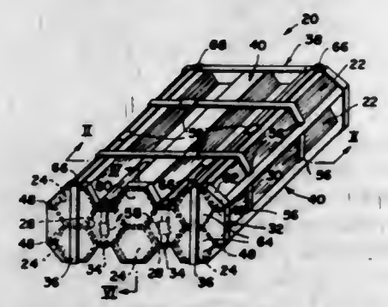
A coil package comprising a generally rectangular back panel, said back panel having central thru holes for removable mounting on a coil-winding machine, a centrally open coil having one side in facing engagement with the front of said back panel and projecting diametrically beyond opposite ends of said back panel, a pair of end

panels hingedly connected to opposite ends of said back panel and each having a medial thru opening, said end panels extending forwardly from said back panel beyond said coil and receiving respective projecting coil portions in said medial openings, one of said end panels having a slot, the free end of said coil passing outwardly through the medial opening of said one end panel and inwardly through said slot, a pair of front panels hingedly connected to the forward edges of respective end panels and extending inwardly toward and terminating short of each other at opposite sides of the central coil opening, said front panels each having a cut opening through its outer edge to the adjacent medial opening for passage of said



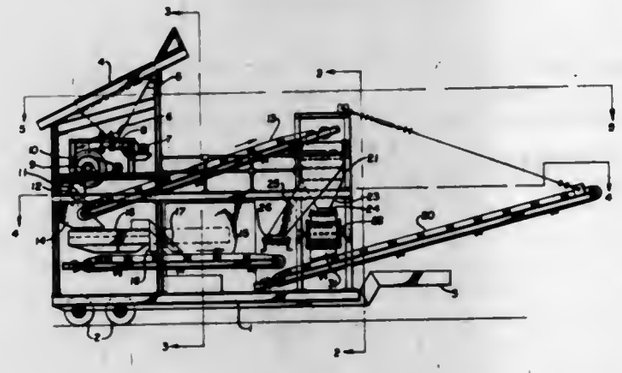
front panels over the projecting coil portions upon inward swinging of the end and front panels, an extension panel hingedly connected to the inner end of each front panel extending rearwardly into the central opening of said coil at opposite sides thereof toward said back panel, said extensions each extending chordally across said central coil opening, a flap on the rear end of each extension lying in facing engagement with each other and said back panel extending across and closing said holes, said flaps having circular edge contours concentric with said coil to rotatably support the latter, and fastener means securing said flaps to said back panel in said concentric relation and closing said holes.

3,272,327
ARTICLE DISPENSER WITH PLASTIC TWISTING MECHANISM
John Busch, 12 Schubertstrasse, Celle, Germany
Filed Dec. 2, 1964, Ser. No. 415,274
Claims priority, application Germany, Dec. 5, 1963, N 15,669
5 Claims. (Cl. 206—56)



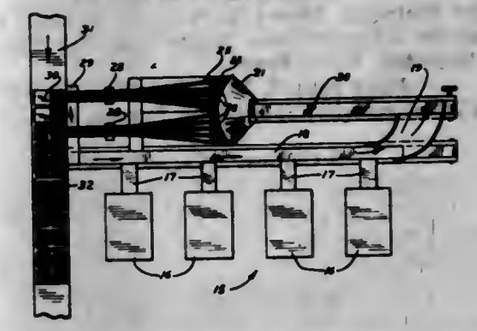
1. In a lipstick casing having a twisting mechanism made of plastic material of the type including a cosmetic holder guided in a slotted tube connected with a base and having guide projections extending through the longitudinal slots in the slotted tube and engaged in the threaded track of a threaded sleeve rotatable with respect to the slotted tube, and said threaded sleeve being covered by an outer metal tube affixed thereto, the improvements comprising an elastic intermediate support seated outwardly of and engaging the slotted tube and disposed between said slotted tube and the inner surface of said outer metal tube, the said intermediate support extending only a fraction of the lengths of said slotted tube and threaded sleeve, said threaded sleeve resting on said intermediate support to provide frictional resistance to accidental relative rotational movements between the slotted tube and the threaded sleeve.

3,272,328
COMMODITY SUPPORT CARD
Robert A. Krzyzanowski, Milwaukee, Wis., assignor to Milprint, Inc., Milwaukee, Wis., a corporation of Delaware
Filed July 22, 1964, Ser. No. 384,306
3 Claims. (Cl. 206—65)



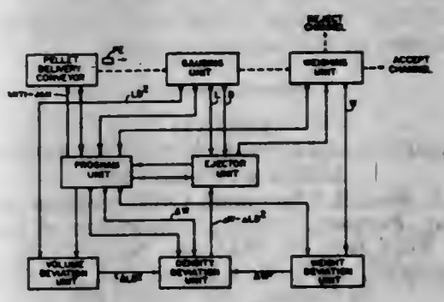
2. A package comprising:
(1) a support member comprising a flat card including side and end edges, a central portion and at least two spaced panels in an upright position out of the plane of the central portion of the card, each panel having an upper portion above the plane of the card and a lower portion below the plane of the card, one of said panel portions being defined by a bent cut formed in the card and having spaced legs opening away from the central portion of the card, and one part of the other of said panel portions being defined by fold lines extending from each spaced leg to the nearest side edge of the card and another part of said other panel portion being defined by end edges of the card;
(2) commodity arranged in two layers on the central portion of the card, one layer extending between the upper portions of the panels and the other layer extending between the lower portions of the panels, with the portion of each panel defined by a bent cut contacting opposed sides of the commodity to hold the panels upright and to retain the commodity on the card; and
(3) an outer wrapper enclosing the card and commodity and snugly conforming to the outline thereof.

3,272,329
CORE BOX ASSEMBLY
John Mehalov, 745 Greenway Drive, Pittsburgh, Pa. 15204
Filed Jan. 26, 1966, Ser. No. 523,127
9 Claims. (Cl. 206—65)



1. A storage box comprising substantially identical cellular metal members each providing a plurality of uniformly spaced, connected polygonal chambers extending longitudinally thereof and open at both ends; said cellular metal members being superposed and providing additional uniformly spaced, formed polygonal chambers disposed between adjacent superposed ones of said cellular metal members and extending longitudinally thereof; said formed polygonal chambers being defined in part by peripheral walls of adjacent ones of said connected polygonal chambers and in part by portions of said cellular metal members intermediate of the adjacent ones of said connected polygonal chambers; all of said polygonal chambers having substantially identical cross sections and configurations and being adapted to receive and store elongated articles; cap members fitted over the ends of said superposed cellular metal members and closing the open ends of said connected and formed polygonal chambers; means for connecting said superposed cellular metal members as a unit; and means for securing said cap members to the ends of said superposed cellular metal members.

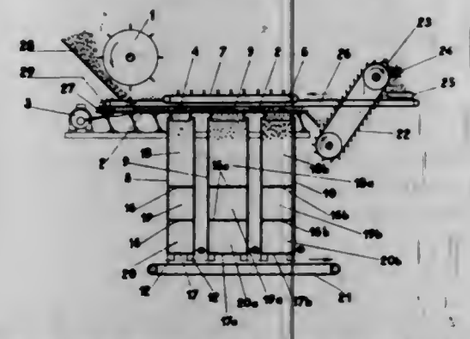
3,272,330
APPARATUS FOR RECLAIMING METAL VALUES FROM SLAG
Hugh J. Nelson, University Heights, Ohio, assignor to The Kaiser-Nelson Corporation, Cleveland, Ohio, a corporation of Ohio
Filed June 21, 1963, Ser. No. 289,578
2 Claims. (Cl. 209—38)



1. In apparatus of the character described, a frame, a grizzly supported by the upper portion of said frame and adapted to screen therethrough materials having metallic values, a shaker feeder disposed directly below said grizzly and adapted to receive the screened material, a magnetic separator disposed directly below said feeder and adapted to separate the screened material into two components, the first of which contains metal values in appreciable quantity and the second of which is substantially free of metal values, a first conveyor having a receiving portion disposed below said magnetic separator and adapted to receive and carry said first component to a higher level than that of said separator, a screen having upper and lower decks on which said first component falls from said first conveyor, means for vibrating said screen, a separate chute and conveyor associated therewith for disposing of each of coarse and less coarse fractions of said first component which are rejected by the upper and lower decks respectively of said screen, a reverse polarity magnetic drum separator with variable field intensity directly below said screen, a hopper directing the fine material comprising the remaining fraction of said first component which passes through both decks of said screen onto said last named separator where it is separated into higher and lower magnetic components, a separate chute and conveyor associated therewith for disposing of each of said magnetic components; another conveyor disposed at a level below said first conveyor for receiving and transporting at least a portion of said second component, and means for directing said second component from said magnetic separator to said another conveyor.

3,272,331
WIENER ORIENTER
Edward G. Thiele and Ralph D. Burgess, Minneapolis, Minn., assignor, by mesne assignments, to Champion Papers, Inc., Hamilton, Ohio, a corporation of Ohio
Filed Sept. 24, 1963, Ser. No. 310,995
20 Claims. (Cl. 209—74)

1. A machine for segregating a plurality of wieners into transversely aligned groups for processing, said machine including a supply of wieners, means to move said wieners into a hopper, the bottom of said hopper comprising a plurality of tracks arranged side by side and each of size to receive and support wieners extending in longitudinal direction along said tracks, means to cause said wieners to move in longitudinal direction along said tracks, means on said tracks to position said wieners so that the ends of the wieners on one track are transversely aligned with the ends of wieners on the other tracks, an indexing conveyor having a plurality of paddles each adapted to engage the ends of transversely aligned wieners on said tracks and move the wieners into separate groups, said conveyor being intermittently operated to deposit said wieners onto a processing station at the end thereof.



3,272,332
CLASSIFICATION METHOD AND APPARATUS
Wallace Jones, Saltsburg, Pa., assignor to Nuclear Materials and Equipment Corporation, Apollo, Pa., a corporation of Pennsylvania
Original application Mar. 14, 1961, Ser. No. 108,220, now Patent No. 3,221,152, dated Nov. 30, 1965. Divided and this application Dec. 2, 1964, Ser. No. 423,883
3 Claims. (Cl. 209—75)

1. Classifying apparatus for classifying an object in dependence upon the comparison of a physical dimension of said object with the corresponding dimension of a standard, the said apparatus comprising means to be connected to said object for deriving a measure of said dimension, variable impedance means connected to said deriving means to be set in accordance with said measure as an electrical analogue of said dimension, said impedance means being variable over its whole range only between limits extending from the electrical analogue of a relatively small percentage smaller than the corresponding dimension of said standard and the electrical analogue of a relatively small percentage greater than said corresponding dimension, memory switch means connected to said deriving means and actuable responsive to said deriv-

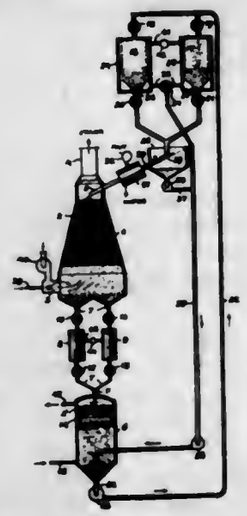
ing means when said dimension of said object falls outside of said limits, and means responsive to actuation of said switch means for classifying said object.

3,272,333
FEED DISTRIBUTOR FOR CIGARETTE-MAKING MACHINES
André Pietrucci, Fleury-les-Aubrais, France, assignor to Service d'Exploitation Industrielle des Tabacs et des Allumettes, Paris, France
Filed Mar. 5, 1963, Ser. No. 262,871
Claims priority, application France, Mar. 7, 1962, 890,239
3 Claims. (Cl. 209—85)

1. A feed distributor for a cigarette-making machine comprising a feeder means for effecting a substantial separation of the bunches of tangled tobacco shreds, separating means for separating a portion of the shreds coming from said feeder means into at least two groups of shreds of different increasing lengths and temporarily storing a reserve thereof, a first conveyor means to carry said at least two groups of shreds to the cigarette-making machine, means for distributing each of said groups of said separated shreds onto said first conveyor means at a predetermined rate, means for adjusting the rate of distribution of each of said distributing means whereby said stream carried by said first conveyor means comprises predetermined proportions of said different groups of separated shreds, means for conveying another portion of the shreds rejected as oversize from said separating means to a location downstream of said separating means, means located at said location downstream of said separating means for carding and crumbling the shreds rejected as oversize by said separating means, and second conveyor means to bring back said oversize shreds after carding and crumbling upstream of said separating means.

3,272,334
ADJUSTABLE TRACK MEANS FOR A SIZER APPARATUS
Kenneth F. Russell, Claremont, Calif., assignor to Brogdex Company, Pomona, Calif., a corporation of California
Filed June 20, 1963, Ser. No. 289,330
Claims priority, application Israel, Oct. 4, 1962, 18,020
15 Claims. (Cl. 209—106)

1. A compact, composite conveyor means for sizing articles of different types with respect to maximum, minimum, average or mean diameters along minor and major axes of such articles, as lemons, oranges and grapefruit, comprising:

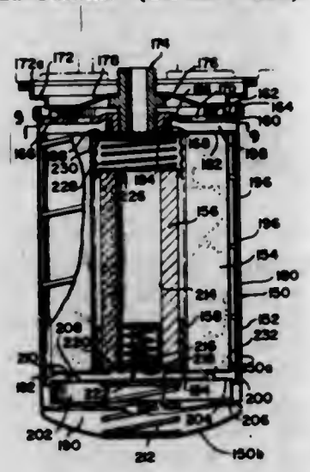


a frame means including spaced side frame members;

conveyor roll means extending between said side frame members in a sizing zone and including a plurality of parallel conveyor rolls and roller chain means having alternate rollers interconnected with adjacent conveyor rolls;

track means on each side frame member, including a normally non-changeable track member supporting the aforesaid alternate rollers and an adjustable track member in spaced relation thereto cooperable with the other of said rollers of the chain means for varying space between the conveyor rolls in the sizing zone;

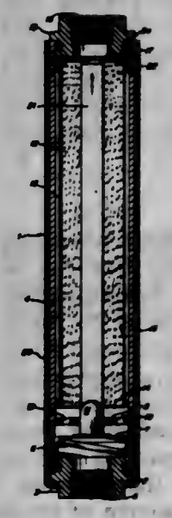
said adjustable track member including a plurality of pivotally interconnected track segments, one end track segment being pivotally connected at one end to the adjacent segment and longitudinally, adjustably secured to the frame means at its other end, track segments in the sizing zone being adjustable to vary angular relationship between adjacent segments and spacing of such segments with respect to the non-changeable track, whereby said adjustable track member is selectively configured to a composite curve preselected for sizing several types of articles.



3,272,335
PROCESS AND APPARATUS FOR MOVING SOLID PELLETS IN A CLOSED CIRCUIT
Frederick Nettel, 173 Chapel Road, Manhasset, Long Island, N.Y.
Filed July 8, 1963, Ser. No. 293,544
3 Claims. (Cl. 210—68)

1. In the method of moving pellets, used as heat transfer agent, continuously in a closed circuit, said circuit comprising an upward flow (riser) part in which the pellets are lifted to a highest level, and a downward flow (downcomer) part, in which the pellets descend under the effect of gravity, the upward flow part containing pellets suspended in the form of a slurry in a rising stream of a liquid at substantially superatmospheric pressure, while the first portion of the downward flow part contains pellets falling through a gas of substantially atmospheric pressure,

the steps of passing the slurry stream through two sequentially operated sluice chambers arranged in parallel and disposed at said highest level, said sluice chambers being at all times completely filled with liquid, separating the pellets from the bulk of the liquid by screening the slurry within said chambers and while still under substantially superatmospheric pressure, thereafter decompressing the resulting slurry concentrate within said chambers, removing the remaining liquid from the pellets at substantially atmospheric pressure, and feeding the dried pellets at substantially atmospheric pressure back into the downward flow part.

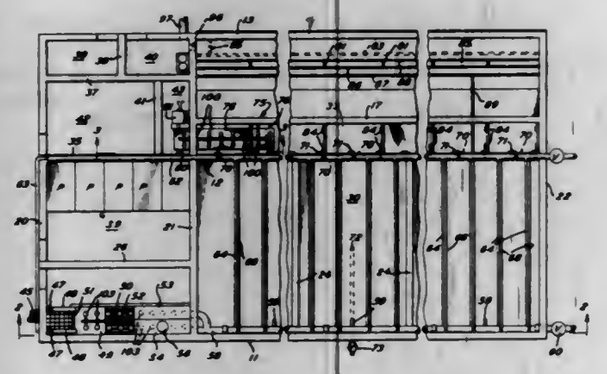


3,272,336
LIQUID PURIFIER AND CLEANER
Kingsley E. Humbert, Jr., Gastonia, N.C., assignor to Wix Corporation, Gastonia, N.C., a corporation of North Carolina
Filed Apr. 5, 1965, Ser. No. 446,789
12 Claims. (Cl. 210—132)

3. A spin-on throw-away liquid purifier comprising a cylindrical casing, a closure member for one end thereof having a threaded central boss for connection to an internal combustion engine and forming an outlet, liquid inlet means in said closure member and disposed around said boss, a liquid separator sealed in said casing and comprising a cylindrical body having a closed top and an open bottom, said cylindrical body forming a shroud depending from said top and extending downwardly in and concentric with the casing, there being a space between the casing wall and the shroud forming a downwardly extending flow passage, the lower end of the shroud being spaced from the lower end of said casing and forming a sump therebelow, an elongate cylindrical annular filter unit within and spaced from said cylindrical shroud, the top having a central opening leading to said outlet and having annular means around said opening in fluid tight sealing connection with and around said boss, said filter unit having an axial passage communicating with said outlet through said central opening of said top, the bottom of said filter unit having a central opening leading into the lower end of said axial passage, means for closing off said opening in the bottom of said filter unit, said shroud extending at its lower end a substantial distance below the bottom of said filter unit, said top being spaced from said closure member and forming a chamber receiving liquid from said inlet means, a baffle unit having a disc head below and spaced from said bottom of the filter unit and of smaller diameter than and positioned within the lower end of said shroud, said baffle unit head carrying a depending skirt portion extending below the bottom of and spaced from said shroud, means carried by said cylindrical body for imparting a spiral centrifugal movement to fluid flowing downwardly through said flow passage from said chamber to the lower end of the shroud, means whereby the liquid is impelled to reverse its direction of flow below the shroud to effect discharge of contaminants therefrom into the sump and to then flow in part upwardly between the filter and the shroud to pass radially inwardly through the filter to said axial passage and to flow in part to the central opening in said bottom of the filter unit and into the lower end of said axial passage for exit through said outlet.

4. The invention according to claim 3 wherein said means for closing off said opening in the bottom of said filter unit comprises a valve means in the lower end of said axial passage adapted to open under fluid pressure in the direction of said outlet, and a pressure relief valve means for admitting fluid directly from said liquid inlet means into said outlet, the second mentioned valve means operating to open under a higher pressure than the said valve means in the lower end of said axial passage.

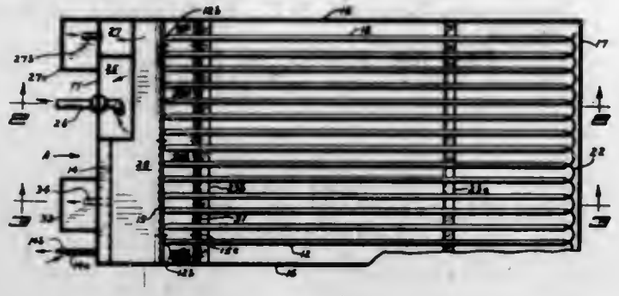
3,272,337
FUEL DISPENSING SYSTEM FOR ASSURING DELIVERY OF UNCONTAMINATED FUEL
Howard A. Elwell, Glen Ellyn, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Filed Apr. 3, 1963, Ser. No. 270,459
1 Claim. (Cl. 210—136)



For a fuel-dispensing apparatus having a pump, discharge conduit connected to said pump, and a flow-controlling valve at the outlet of said discharge conduit, the improvement assuring delivery of uncontaminated fuel comprising:

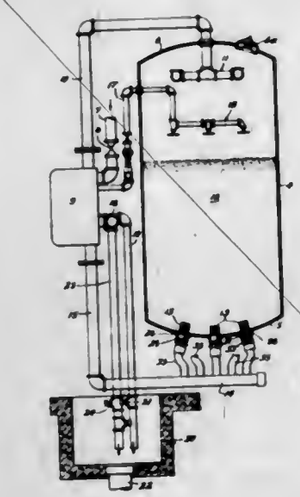
an elongated cylindrical non-sparking filter housing made of light-weight metal and covered with a resilient protective layer inserted in said discharge conduit at said valve, said housing having fuel inlet and outlet ends fitted with end caps, at least one of said end caps being easily removable from said housing for replacement of a filter element therein; a replaceable cylindrical filter element positioned in said filter housing and adapted for removing solid particles from fuel flowing therethrough, said filter element having an outer filter medium with its inner surface forming a centrally located hollow passage, a filter element outlet end cap provided with a centrally located fuel outlet port, said filter element outlet end cap being in a sealing relationship with said housing fuel outlet end cap, and an unperforated filter element end cap having a centrally located dimple-like element, said unperforated cap and said sealing relationship preventing by-passing of fuel around said filter element; a normally closed check valve positioned between the fuel inlet end of said housing and the adajcent end of said filter element and in sealing relationship with said fuel inlet end of said housing, said check valve being provided with a spring-loaded nipple adapted to fit in said dimple to force said check valve to its open position and to position the inlet end of said filter element when said filter element is in position in said housing so that fuel may pass into said housing through said check valve,

inwardly through said filter medium and out through said outlet end caps; and a bi-directional fluid-conducting swivel joint connected in flow communication between the outlet of said filter housing and said flow-controlling valve.



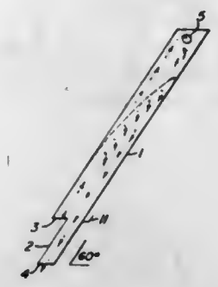
3,272,338
SEWAGE DISPOSAL SYSTEM
William R. Gallagher, 1041 Township Line Road, Jenkintown, Pa.
Filed Mar. 9, 1964, Ser. No. 350,289
14 Claims. (Cl. 210—177)

1. In a sewage disposal system, an aeration tank, a sewage supply pipe for delivering sewage into said aeration tank, a settling tank extending along said aeration tank and separated therefrom by a common wall, said common wall having delivery openings therethrough communicating said tanks, a downwardly extending separating wall in said settling tank in spaced relation to said common wall and terminating above the bottom of said settling tank, said separating wall and said common wall providing a chamber therebetween for the collection of floatable material, a source of air under pressure, a plurality of pipes connected to said source and provided at spaced locations along said aeration tank, each pipe having a downwardly extending portion with a plurality of discharge openings intermediate the top and bottom of the liquid in said aeration tank, air lift means connected to said source and extending from said collection chamber for the return of material from said settling tank to said aeration tank, fluid discharge means for delivery of fluid from said settling tank at a predetermined level, air delivery members for impelling floatable material along said collection chamber, and a conveyor member for receiving and removing the floatable material.



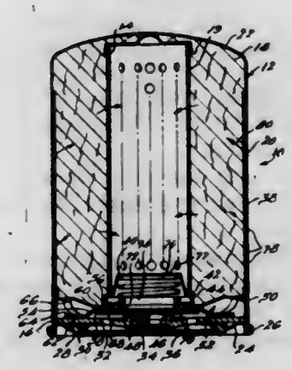
3,272,339
BEESWAX CAPPING MELTER
Melford E. Olson, 4749 Florida Ave. N., Minneapolis, Minn.
Filed May 3, 1963, Ser. No. 277,771
4 Claims. (Cl. 210—182)

1. A capping melter for recovering honey, beeswax and other capping products comprising:
(a) a separating tank;
(b) a plurality of elongated substantially parallel heating elements mounted horizontally in the upper portion of the tank and provided with heat supplying connection means on one end thereof, the other end of said elements being independent of one another and being substantially free along the entire length thereof to permit unobstructed flow and scraping therealong throughout substantially the entire length thereof to remove products collected thereon;
(c) means for discharging honey and beeswax to be separated on the top surface of said heating elements adjacent said one end;
(d) means supplying heat to said elements to melt honey-containing beeswax cappings supplied thereto;
(e) a partition means extending across said tank, the upper edge of said partition means terminating below said heating elements to provide a melted honey collection compartment and a first melted honey withdrawal compartment therein;



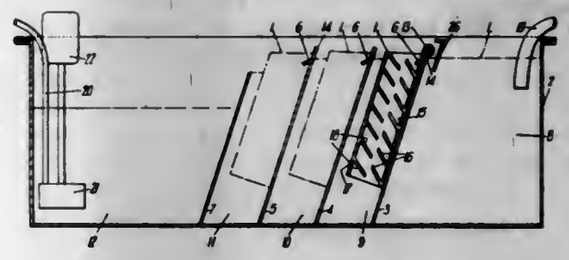
(f) communication means between said first honey withdrawal compartment and the lower portion of said melted honey collection compartment; and
(g) a second collection compartment provided by said partition means adjacent said other end of said element to receive hot honey and beeswax flowing above said heating elements with means for separately withdrawing the honey and wax from said second compartment.

3,272,340
QUICKLY DETACHABLE STRAINER SYSTEM FOR WATER TREATMENT TANKS
Churchill Hungerford, Jr., Wenonah, N.J., assignor to Hungerford & Terry, Inc., Clayton, N.J., a corporation of Delaware
Filed May 22, 1963, Ser. No. 282,258
4 Claims. (Cl. 210—232)



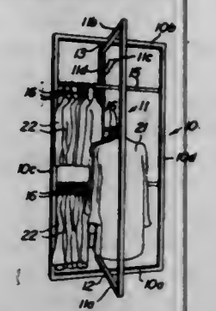
1. In water treating equipment employing a filter-type bed of small-particled treating material, the combination of a tank having a bottom head, a plurality of openings in said head, strainer members adapted for ready insertion and removal through the openings from outside the head, a collector manifold below the head, quickly detachable means securing each strainer member in its opening, and fluid connection means between each strainer member and the manifold, all so arranged that said strainer members may be removed without disturbing said manifold.

3,272,341
WET SEDIMENTATION APPARATUS
Risto Tapani Hukki, Otakallio, Otaniemi, Finland, assignor to Insinooritoimisto-Engineering Bureau R. T. Hukki, Otakallio, Otaniemi, Finland
Filed Sept. 21, 1961, Ser. No. 139,807
7 Claims. (Cl. 210—322)



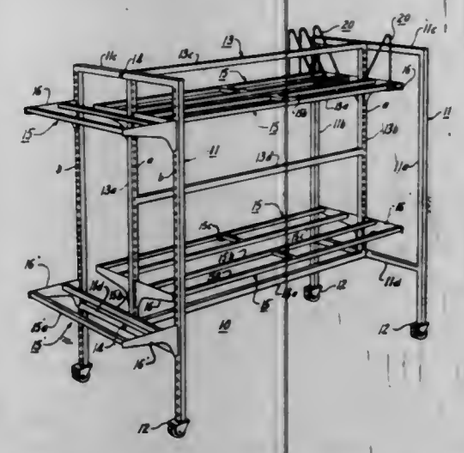
2. A self-contained sedimentation unit adapted for substantially face-to-face placement with other like units in a wet sedimentation tank, comprising an elongate, longitudinally rectilinear box having imperforate walls, closed top, and open bottom, said bottom being of stepped formation defining separate bottom inflow and outflow openings exteriorly of the unit, said openings facing in the same direction but being offset relative to and separated from each other along the length of the box by an intermediate but exterior wall, so as to produce substantially laminar inflow of liquid to be clarified and substantially laminar outflow of settled solids; discharge conduit means for clarified liquid leading from the upper part of the box, said conduit means having means to form a siphon when the unit is installed in said sedimentation tank; and means for mounting said unit in inclined position within the sedimentation tank, with the bottom inflow opening above the bottom outflow opening.

3,272,342
FILTER WITH FLOW DISTRIBUTOR
James C. McLaren and Louis F. Niebergall, Racine, Wis., assignors to Walker Manufacturing Company, a corporation of Delaware
Continuation of application Ser. No. 144,079, Oct. 10, 1961. This application Feb. 19, 1965, Ser. No. 435,783
6 Claims. (Cl. 210—440)



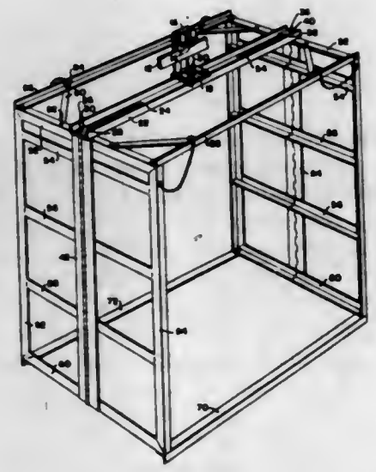
2. In a disposable or throwaway oil filter, a disposable housing having an imperforate side wall and an imperforate closed end, a plate permanently secured to and closing the other end of the housing, said plate having an oil inlet and an oil outlet formed therein, a perforated center tube in said housing extending substantially the full length thereof and being closed at its end adjacent the imperforate end of the housing, the other end of the center tube being open and connected to said oil outlet, an imperforate transverse wall extending transversely from the open end of said center tube to a point adjacent but spaced inwardly from the inside of said side wall, the space inside said housing between said plate and said wall comprising an oil inlet chamber communicating with said oil inlet and with the transverse space between the transverse wall and the inside of the side wall, an oil flow pervious screen in said housing in contact with the inside of the side wall and filling said transverse space between the transverse wall and the inside of the side wall, said screen extending lengthwise of the housing in contact with said side wall to a point adjacent the imperforate closed end of the housing, the space between said transverse wall and the imperforate end of the housing comprising a filter chamber, said screen providing a network of oil flow passages interconnecting the oil inlet chamber and the filter chamber and extending lengthwise of the filter chamber for substantially the full length thereof, and a mass of depth type filter material packed into and completely filling the filter chamber and pressing against the transverse wall, the imperforate end, the center tube, and pressing against and holding the screen against the inside of the side wall, said screen serving to slightly space the depth type filter material from the side wall, oil being filtered flowing transversely from said screen through the filter material to said center tube.

3,272,343
APPARATUS FOR SEPARATING LIQUIDS OR SOLIDS FROM LIQUIDS
Thomas Caldwell, Mugdock, near Milngavie, England, assignor to Smith Fullerton Limited, Glasgow, Great Britain, a British company
Filed July 3, 1963, Ser. No. 294,462
Claims priority, application Great Britain, July 7, 1962, 26,128/62
5 Claims. (Cl. 210—521)



1. Separating apparatus for separating solids from a mixture with liquids or for separating a mixture of liquids of different specific gravities, and especially for separating metal particles from coolants for machine tools being ground, said apparatus comprising a tank for the mixture, a plurality of upstanding baffles dividing the tank into a plurality of compartments and forming weirs over which the mixture may flow successively from one compartment to the next, a plurality of upright conduits, each between two of said baffles, and having inlets at their upper ends open to the mouths of the respective weirs and having outlets at their lower ends open to the respective compartments, and an upright passage between the outlet of each conduit and the next weir in the direction of flow of the mixture, and in each conduit, first and second upright and opposed series of fins extending transversely of the conduit and projecting into the flow path, the fins of the first series being upwardly inclined and forming with the conduit a succession of pockets having their mouths facing upwardly against the direction of flow, and the fins in the second series being downwardly inclined and arranged to deflect the mixture into said pockets.

3,272,344
MERCHANDISING DISPLAY RACK
John W. Sugden, 1810 Orchard Drive, Salt Lake City, Utah
Filed July 6, 1964, Ser. No. 380,536
4 Claims. (Cl. 211—1)

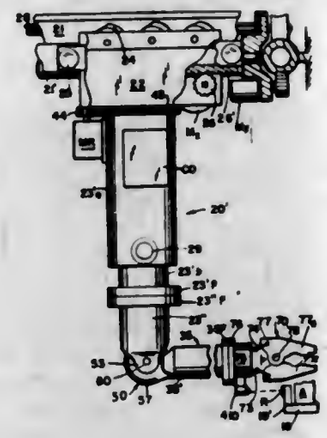


1. A merchandising display rack, comprising intersecting and crossed, vertical frames of rectangular formation and substantially equal height fabricated from rigid metal tubing, polygonal in cross section and connected in mutually flush relationship at points of intersection of said frames; hanger bars adapted for removable insertion within and transversely of said frames; and anchoring means for holding said hanger bars securely within the frames, said anchoring means including vertical series of transverse slots formed in strips secured to and along the inner faces of respective vertical members of said frames, and holding means for opposite ends of the respective hanger bars, said holding means being saddle-shaped fittings adapted to be secured in selected slots of said strips and to securely seat respective ends of the hanger bars.

3,272,345
CLOTH BOLT HOLDER AND RACK
John W. Wallace, Bradfordwoods, Pa., assignor to The Brad-Mar Corporation, Wexford, Pa., a corporation of Pennsylvania
Filed Jan. 11, 1965, Ser. No. 424,776
15 Claims. (Cl. 211—44)

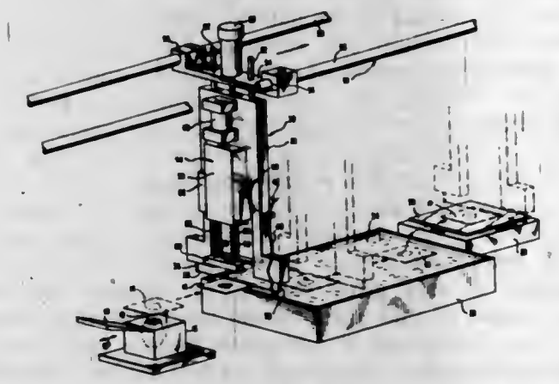
4. A display and utility rack suitable for cloth bolts wrapped on a mandrel which comprises, an upright support frame, at least one shelf detachably-carried by said support frame to project outwardly therefrom, at least one holder slidably-positioned for movement along said shelf to removably-receive the cloth bolt endwise along its mandrel and support it in an upright position on said shelf, said shelf having a pair of spaced-apart longitudinally-extending front and back bars, said holder having a pair of upwardly-projecting leg portions connected at their upper ends and flexibly stressed with respect to each other, each of said leg portions having a concave foot portion, one of said foot portions being slidably-positioned on one of said bars and the other of said foot portions being slidably-positioned on the other of said bars, and each said foot portion having an open side with respect to its associated bar, so that said leg portions when manually-flexed can be employed to insert and remove said foot portions from said bars.

3,272,346
SMOKEHOUSE RACK
Albert J. Michaud, 314 Canal St., Salem, Mass.
Filed Jan. 31, 1964, Ser. No. 341,592
7 Claims. (Cl. 211—118)



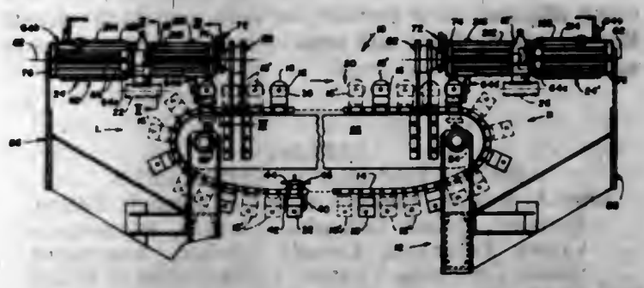
3. In meat-smoking apparatus wherein a trolley rides upon a track, passing through a smokehouse, a rack comprising an upward facing channel pivotally attached to said trolley, a pair of piano hinges having ends slidably disposed in and suspended from said channel, side frames disposed parallel to and on either side of said channel and said piano hinges, cross-members welded between said piano hinges and said side frames, and means pivotally connecting horizontal and upright members of said side frames whereby movement of the ends of said piano hinges in said channel toward one another effects collapsing of said rack.

3,272,347
ARTICLE MANIPULATION APPARATUS
Jerome H. Lemelson, 85 Rector St., Metuchen, N.J.
Filed Jan. 14, 1963, Ser. No. 251,410
9 Claims. (Cl. 214—1)



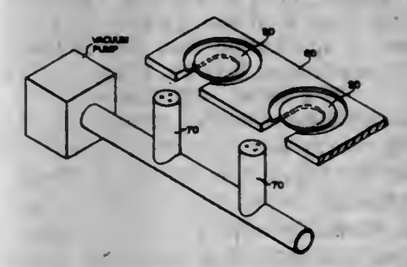
1. An article manipulator for handling work-in-process comprising in combination:
(a) a manipulator arm assembly including mechanical means disposed at one end thereof for seizing and retaining an article,
(b) a base member operatively connected to said manipulator arm assembly for supporting said assembly,
(c) manipulation means between said base member and said arm assembly for moving and guiding said arm assembly,
(d) first servo means for driving said manipulator arm assembly in predetermined path relative said base member,
(e) said seizing means comprising means for engaging and retaining an article on said manipulator arm assembly and including at least one member movable for grasping and releasing said article,
(f) second servo means connected for operating said article seizing means,
(g) controls for said servos,

(h) a variable programming means operatively connected to said servo controls including means for generating a plurality of control signals of predetermined characteristics and in a predetermined sequence,
(i) said programming means being operative to control said servos and to predetermine the movement of said manipulator arm assembly and said article seizing means along a predetermined path to automatically effect manipulation of an article retained



by said manipulator, the movement of said article through a predetermined spatial path and the release of said article at a predetermined position along the path of movement of said arm assembly,
(j) sensing means mounted on said manipulator and movable therewith for sensing the presence of an article prepositioned relative to said manipulator, said sensing means including means for generating a signal upon sensing an article adjacent said manipulator, and initiating predeterminedly responsive operation of said programming means.

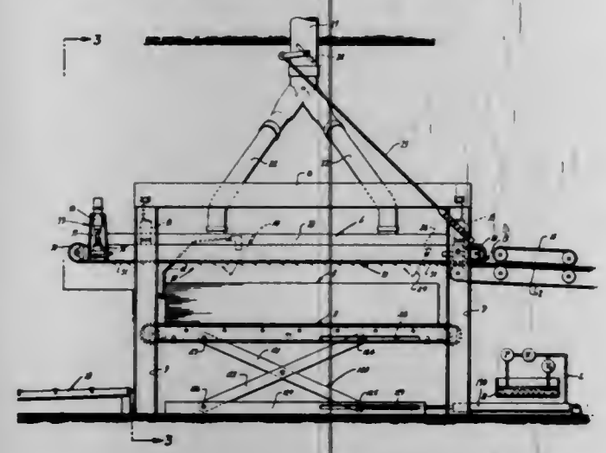
3,272,348
MICROTOME SECTION PICKUP AND MANIPULATOR
Howard D. Metz, Bethesda, Md., assignor to the United States of America as represented by the Secretary of the Department of Health, Education, and Welfare
Filed July 7, 1964, Ser. No. 380,967
7 Claims. (Cl. 214—1)



1. A process for handling microtome sections of organic material and of material which will soften under heat which comprises engaging a surface of the section with a fine wire-like element, heating said wire-like element, allowing said heated wire-like element to soften a portion of said microtome section, and cooling said heated wire-like element to adhere the melted portion of said section thereto.

3,272,349
ARTICLE TRANSFERRING APPARATUS
Rome R. Rudolph, Gibsonia, and Carl Strutz, Jr., and Frank C. Strutz, Mars, Pa., assignors to Carl Strutz & Co., Inc., Valencia, Pa., a corporation of Pennsylvania
Filed July 13, 1964, Ser. No. 382,005
13 Claims. (Cl. 214—1)

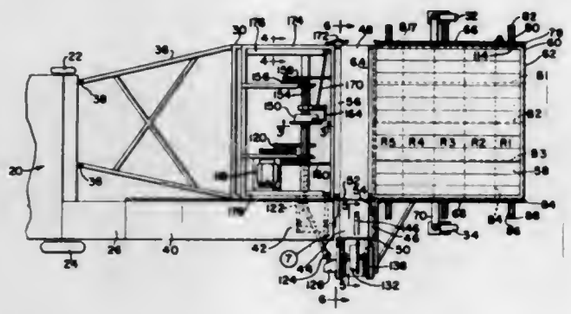
1. Apparatus for transferring articles individually from a first location to a second location while simultaneously changing the orientation of said articles from a first orientation when at said first location to a second orientation when at said second location, said apparatus comprising in combination: an elongated carrier supported for rotation about its central longitudinal axis; a plurality of spaced clamping assemblies individually mounted on said carrier for reciprocal movement along straight-line paths of travel, each of said clamping assemblies having a pair of cooperating arms biased in a clamping direction and adapted to receive one of the articles to be transferred, a first of said cooperating arms being movable radially of said axis and having a cam follower rotatably mounted thereon; cam tracks mounted on said carrier, one each disposed along the path of travel of each of said clamping assemblies; the cam follower of each of said clamping assemblies being engaged with the respective cam track; said cam follower and said track cooperating to sequentially (a) open said cooperating arms during movement thereof away from both said first and second locations, (b) close said cooperating arms when at said first location to effect pickup of the article to be transferred, and (c) open said cooperating arms when at said second location to release the article transferred; and second drive means for rotating said carrier whereby the article transferred is rotated from said first orientation to said second orientation during transfer from said first location to said second location.



3,272,350
METHOD AND APPARATUS FOR SEMICONDUCTOR WAFER HANDLING
Peter E. Pflanmer, Catonsville, Baltimore, and Theodore Patrick, Ellicott City, Md., and John W. Phillbrick, Pittsburgh, Pa., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed Sept. 25, 1964, Ser. No. 399,200
7 Claims. (Cl. 214—1)

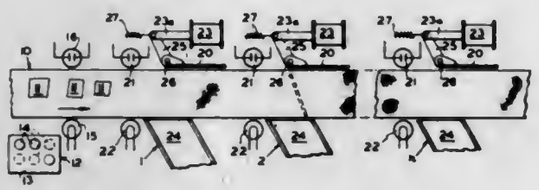
1. A wafer carrier for rapidly handling a plurality of semiconductor wafers or the like without breakage or contamination and comprising: a generally flat rigid member having opposed major surfaces and an edge surface;

a plurality of recesses in one of said major surfaces for receiving and retaining a like plurality of semiconductor wafers; a plurality of slots through said member each extending from said edge to at least one of said recesses, said slots being mutually parallel for positioning said member about a plurality of vacuum chucks so semiconductor wafers can be transferred between the vacuum chucks and the recesses in said member; said recesses being disposed in a plurality of rows and each of said slots extending from said edge to one of said recesses in each of said rows.



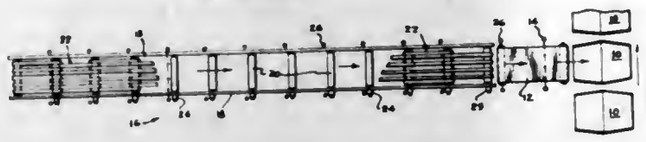
3,272,351
SHEET HANDLING APPARATUS
John A. Burton, Vancouver, and William E. Follett, Burnaby, British Columbia, Canada, assignors to Crown Zellerbach Canada Limited, Vancouver, British Columbia, Canada, a corporation of British Columbia
Filed Jan. 25, 1963, Ser. No. 253,938
8 Claims. (Cl. 214—6)

8. A vacuum conveyor having a vacuum chamber with at least one downwardly facing valved opening, subjacent which sheet material is conveyed along a path of travel, the valve for said opening being rotatably mounted therein with the axis of rotation perpendicular to the path of sheet travel, said valve having a closed position and a rotated open position and means biasing it about said axis in a direction opposed to the direction of sheet travel to said closed position, and means for sealing said opening against adjacent sheet material including a flap connected to said valve and extending in the path of sheet travel when the valve is in the closed position and operable by the sheet material to move out of said path and rotate said valve to and hold it at said open position and to seal the leading edge of the sheet while the sheet moves adjacent said valve.



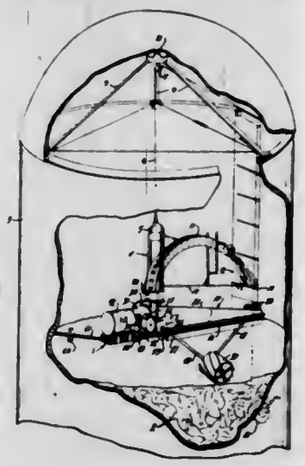
3,272,352
AGRICULTURAL BALE-HANDLING MACHINE
Wayne W. Adams, 1110 S. Main St., Roswell, N. Mex., and Theo Garrison, Dexter, N. Mex.
Continuation of application Ser. No. 351,062, Mar. 11, 1964. This application July 29, 1965, Ser. No. 475,836
22 Claims. (Cl. 214—7)

2. A bale-handling machine, comprising: a supporting frame having means for connection to and travel with a pick-up baler having a bale outlet; platform means on the frame adjacent to and for receiving a bale from the outlet in an on-end position; platform extension means on the frame and extending from the platform means crosswise of the line of advance for a distance several times the width of an on-end bale; a body on the frame rearwardly of and coextensive in width with the crosswise extent of the extension means and offset laterally from the platform means, said body including a floor having a front end adjacent and in bale-receiving relation to the extension means and further having a rear delivery end; first shift means on the frame cyclically operative to shift bales successively from the platform means onto the extension means in increments of one bale width per bale to ultimately form a transverse row of on-end bales



on and coextensive with said extension means; second shift means on the frame and cyclically operative on successive rows of bales to shift such rows one-bale width rearwardly onto the floor to accumulate on said floor a plurality of transverse rows of on-end bales in fore-and-aft abutting relationship; and means operative incident to a predetermined accumulation of rows for discharging said rows from the floor at the rear end of said body.

3,272,353
ARTICLE SORTING SYSTEM
Karl T. Wilder, Randolph Township, N.J., assignor to ECD Industries, Mountainside, N.J., a partnership
Filed Jan. 2, 1964, Ser. No. 335,172
24 Claims. (Cl. 214—11)



1. In an article sorting system having a plurality of successive article discharge stations; means for conveying articles successively to said stations; and selectively operable discharging means at each station: one selection means for selecting any one of a number of said discharge stations; control means for effecting operation of a station's discharging means when an article is at the station selected for that article's discharge; said control means including means, responsive to repeated selection of the same given discharge station for different given articles before the first of said given articles has been discharged at said given station, for causing the discharge means of said given station to operate only when said given articles are at said given station; said control means comprising a plurality of control devices for each discharge station, each of said control devices being adjustable to a number of different conditions including a discharge-effecting condition; said control means further including means, operable in response to operation of said selection means to select a station for an article's discharge, for causing adjustment of at least one of the control devices for that station before said last-mentioned article has arrived at the first of said plurality of stations.

3,272,354
MEMORY APPARATUS
Walter G. Harrison, Westchester, Leo A. Gary, Chicago, and Allan C. Audet, Arlington Heights, Ill., assignors to The Spra-Con Company, Chicago, Ill., a corporation of Illinois
Continuation of application Ser. No. 210,699, July 18, 1962. This application June 3, 1965, Ser. No. 467,170
18 Claims. (Cl. 214—11)
